Reports from Her Majesty's Representatives respecting the Tenure of Land in the several Countries of Europe.

Part I.

Circular addressed to Her Majesty's Representatives abroad.

My Lord,
Sir,

Foreign Office, August 26, 1869.

HER Majesty's Government are very desirous of obtaining the fullest information in regard to the laws and customs affecting the tenure of land in the several countries in Europe, with the view of ascertaining what points there may be in such laws and customs as could be usefully adopted in the settlement of land tenure in Ireland, which is a question of pressing importance.

The general character of the information sought is set forth in the inclosed questions. The object is to ascertain, as nearly as may be, how landed property is held in the various countries of Europe, having regard to the character, social condition, employment, and other industrial resources of the people, the institutions of their respective countries, and their combined effect on the system by which the tenure of land is regulated.

It is also an important consideration to ascertain, not only the nature of the tenure by which land is held, whether by purchase, lease, inheritance, or co-partnership, as in the case of waste lands, but also the numerical proportion that exists between the proprietors, under whatever nomination, and the agricultural labourers, and the relationship between them, which would include the average number of labourers to the acre, and the extent to which female labour is employed in agriculture, and machinery used as a substitute for or in aid of manual labour. In elucidation of these points, a statement showing the proportion between waste and cultivated lands,—between lands under tillage, reserved for pasture, or occupied by woods and forests,—and the system of rotation of crops, and of management and appropriation of timber, prevalent in the several countries.

It must be borne in mind that in Ireland the relations of landlord and tenant are [illegible]ded on the express or implied contract of the parties, and not upon tenure or service, [illegible] the [illegible] of the occupiers of land hold by verbal agreement from year to year, they are liable [illegible] the determination of their tenancy, to be evicted without any compensation for their [illegible]rements, and also to have their rents raised at the discretion of the landlord.

The object of the queries in Part B is mainly to contrast the existing system of land tenure in Ireland with that which prevails in other countries, especially when the land is occupied by a tenant in consideration of such tenant paying a certain stipulated rent to the landlord, and to ascertain how far the laws and customs affecting such tenures in other countries differ from those existing in Ireland.

Full information should therefore be given as to the limitation in other countries of proprietary rights, as they exist in Ireland,—whether the granting of leases and compensation for improvements have been enforced by Legislation; how far, if at all, the positive law is modified by custom; and also, how far such custom is recognized by the Law Courts; and what are the precise relations between landlords and tenants, and their mutual rights and duties.

The object of the queries in Part A is to afford Her Majesty's Government full information as to the condition of small proprietors in the various countries in Europe where they exist, and their mode of living, cultivation, &c.

In some countries the land is divided between them and tenants under proprietors; and in other countries, in some districts, the land is nearly exclusively held by small proprietors, and in others by tenants holding under large proprietors. In these cases a comparison between both classes would be very useful, or showing in what respects they differ in their character, social condition, and system of farming, and their respective influences upon the development of the agricultural resources and general welfare of the country.

In many European countries there probably exist full statistics on several of the matters referred to in the queries, reduced, or easily, reducible, to a tabular form. Her Majesty's servants who may be employed in drawing up the Reports should, of course, avail themselves of these.

Her Majesty's Government do not merely seek to obtain accurate information as to prevailing systems, but they wish also to be enabled to judge of the value of each; and therefore they desire that the Reports should be accompanied by such general observations as may be derived from treatises specially dealing with the subject, from the opinion of persons of intelligence belonging to the countries, and also from the personal observation of the writers of the Reports.

I consider that the Secretaries of Her Majesty's Embassies and Legations may very advantageously employ themselves in drawing up these Reports, obtaining through the Heads of the respective Missions every facility they may require, together with permission to visit any particular district of the country in which they reside, the observation of which may be likely to assist their inquiry.

It may very possibly occur to you also to employ on the same work such of the Consuls as may have within their reach means of acquiring useful information. I will not at present name any particular Consul, but I should be glad to receive from you, with as little delay as possible, the names of the Consuls you may recommend, and I will then add to your list the names of any others that may occur to me.

To those whom you may select yourelf, as well as to the Secretary of your , you will at once give copies of this despatch and its inclosure, recommending the matter to their earliest and most attentive study, and desiring them to send in their Reports with as little delay as possible.

I need scarcely say that any additional information which you may yourself supply will be highly agreeable to Her Majesty's Government.

I may add that the Reports to be made by Secretaries under this instruction will be *received in lieu of their Reports for the current* half-year; and that if for any reason the Secretary of Embassy or Legation is not available for this service, you are at liberty to devolve it on a Second Secretary.

I am, &c.
(Signed) CLARENDON.

Inclosure.

Queries.

Name of Country:
Population:

Industrial Pursuits:

LAND OCCUPATION.

What is the system of land occupation: whether by—
(A.) Small Proprietors;
(B.) Tenants under Proprietors, and Sub-Tenants under intermediate Tenants, holding from Proprietors;
and in what proportion do these several systems exist?

(A.)—SMALL PROPRIETORS.

1. What quantity of land is usually held by each, and is it usually held together or intersected by other properties?
2. What is the law regulating the descent and division of landed property on death of owner?
3. What is the legal method used for the sale, transfer, exchange, or division of such

properties—whether by distinct conveyances or by a registry only; and what is the usual relative cost of same?

4. Are there any special facilities afforded for raising loans upon such properties, either from Government, or special public companies, or banks, aided by Government, or otherwise? If so, are they commonly raised, and on what terms and conditions—whether for the purpose of buying off family charges, or for improvement of the property, or other purposes?

5. Are these properties heavily mortgaged, and what is the usual rate of interest?

6. What is the legal method of registering these mortgages and cost of registry, and of other legal proceedings connected therewith?

7. What crops are raised, and in what rotation, and what is the general mode of cultivation.

In what manner are stock raised and pastured on small properties? What is the proportion between tillage and grass lands?

8. Is machinery much employed as a substitute for, and in aid of, manual labour?

Are many hired labourers employed? What is their average number to the acre? To what extent is female labour employed?

What are the average daily wages of the agricultural labourer, male and female, distinguishing between those who live with their employers and those who do not?

9. Do many of these agricultural labourers emigrate? If so, to what extent; and to what cause is such emigration attributed?

10. Do these proprietors generally live on their properties or in villages adjacent thereto?

11. How are they housed, fed, and clad, and what is their standard of living, and their general circumstances?

12. What is their average population per acre and the annual rate of increase in the population among the small proprietors, as compared with the urban population in their own country, and the annual rate of increase in other countries?

13 What is the prevalent public opinion as to the advantages or disadvantages of any part of the above system?

(B.)—Tenants and Sub-Tenants under Landlords.

Tenure.

1. What quantity of land is usually held by each?

2. What is the nature of the tenure, its usual duration, and leading incidents? Are sub-tenancies assignable by the tenant; and if so, must the landlord consent to such assignment?

3. How is the tenancy created, whether by parol or written agreement? When there is no agreement, what does the law declare or presume as to duration of tenancy?

4. Is there any system by which a written agreement may be registered, and what is its nature?

5. Is there any law or custom whereunder a tenant is considered as having a right to remain in occupation of his holding so long as he punctually pays the stipulated rent, or [illegible] rent to be determined from time to time by some legal Tribunal, or by agreement, subject [illegible]tion?

[illegible]stom where under a tenant is considered as having a right to sell his interest in his [illegible]ith or without consent of landlord; and if so, under what conditions?

Rent.

1. In case of tenancies is the payment to the proprietors made by a fixed amount in money or kind, or by share of the produce?

2. Is the rent regulated by custom, valuation or [illegible]tition? If by custom, what is the nature of the custom, and is it recogni[illegible] by Courts of Law? If by valuation, what is the mode of valuation, and by whom made? Is rent payable yearly or half-yearly, and is there a hanging gale?

3. Has the landlord an unlimited power of raising the rent, and of eviction in case of non-payment of rent, or breach of covenant, or otherwise?

4. What are the legal means or procedure by which the respective rights of proprietors and tenants for recovery of rents and other claims are enforced, and does the law confer upon the landlord any exceptional privilege over other creditors?

Evictions.

1. What are the legal means of procedure by which a landlord evicts a tenant? What notice is required to be served on tenants? What is the legal mode of resisting such eviction on the part of the tenant? And in case of eviction for non-payment of rent, is the tenant allowed any time to redeem?

2. Are such evictions frequent, and from what causes?

Improvements.

1. Are they executed (especially buildings) by landlord or tenant?

2. If by tenant, under what security, if any?

3. Has the landlord, upon resuming possession, a legal right to the improvements made upon the farm by the tenant, or does the law recognize any and what right in the tenant?

4. If so, how is such right defined, ascertained, and enforced?

5. Have tenants any means of raising loans for improvements of their holdings, either from Government, or special public companies or banks, aided by Government, or enabled by special law or charter to grant loans; and if so, on what terms, conditions, and security are these loans made?

Miscellaneous.

1. Are the relations between landlord and tenant friendly or otherwise; and is there any legislative interference required by the tenants for their better protection?

2. What is the mode of cultivation by these tenants; and in what respects, as regards cultivation of their farms, employment of labour, mode and standard of living, solvency, independence, and general circumstances and character, are they inferior or superior to the small proprietors?

3. What is the annual rate of increase in the population among tenants as compared with that of small proprietors?

4. Do these tenants or their children emigrate? If so, to what extent; and to what cause is such emigration attributed?

5. What is the prevalent public opinion as to the advantages or disadvantages of any part of the above system?

6. Has the creation of freeholds or tenancies by proprietors, or the granting of leases, been ever enforced by legislature? If so, to what extent, and upon what conditions?

7. In case of any such limitation of proprietary rights, has any, and what, compensation been granted to proprietors?

8. What is the state of public opinion as to the advantages and disadvantages of such system?

9. Have any steps been taken by Government to create or increase the number of owners or freeholders, and is any system now in force with this object?

10. Do tenants receive any assistance by law, public credit, or otherwise, in their endeavours to become proprietors of their own holdings or of other farms? Are such endeavours frequent? And in the desire to make them frequent or not?

11. How far do the laws in force tend to favour the accumulation or dispersion of land?

12. Are there any tenures resembling the copyholds [illegible] upon [illegible] which [illegible] or services have become, *or are becoming*, fixed by [illegible] What is their nature and mode of growth?

Answers to preceding Circular.

No. 1.

Mr. Ward to the Earl of Clarendon.—(*Received November* 8.)

My Lord, *Hamburgh, November* 5, 1869.

I HAVE not failed to devote my attention to the subject of your Lordship's Circular despatch of the 26th of August last, stating the desire of Her Majesty's Government to obtain full information in regard to the tenure of land in European countries, with a view to the settlement of the difficulties arising out of the system of land-tenure in Ireland, and inclosing a list of questions, showing the general character of the information sought for.

I have now the honour to inclose three statements explaining the condition of landed property, and of the owners, tenants, and labourers in the Hanseatic territories of Hamburgh, Bremen, and Lubeck respectively; also a similar statement showing the condition of the landed interests in the neighbouring Duchies of Schleswig and Holstein.

The result of these several statements is that the large estates are generally divided, and let to farmers on lease for terms of years, as in England, and that the rest of the land is in the hands of an independent peasantry ("Bauern"), who cultivate their own small properties with their own means, and are, upon the whole, a thriving set of people. The system of occupying lands as tenants-at-will, or from year to year, such as unfortunately exists in Ireland, is not known in this part of Germany.

I have, &c.
(Signed) JOHN WARD.

Inclosure in No. 1.

Statement as to Land Occupation and Land Tenures in Hamburgh, Bremen, Lubeck, and the Duchies of Schleswig and Holstein.

Hamburgh.

THE territory of the Republic of Hamburgh comprises 7,4[illegible] geographical square miles. The population, exclusive of the Prussian garrison, is 302,581 souls. The prevailing religious confession is the Lutheran, being 89·87 per cent. of the population. The Reformed (or Calvinists) form 1·9[illegible] per cent.; the Catholics, 1·92 per cent.; and the other Christian sects 0·24 per cent. of the population. The Jews and [illegible]tians make up the remaining 6·2 per cent.

The larger portion of the population is employed in commerce and [illegible] but one-third of it depends upon manufactures; a[illegible] number of per[illegible] their subsistence from the cultivation of the soil is little more than [illegible],000.

The cultivable Hamburgh territory is chiefly divided into the Geestland and the Marschland, each of which covers about two-sevenths of the entire surface. The Geestland, originally part of the Duchy of Holstein, is mostly northward of the city, and is a light sandy soil. The Marschland lies on both sides of the Elbe, and includes several small islands formed in the river. It is a strong clay, intermixed with alluvial deposits, and very fertile. The Vierlande district, near Bergedorf, extends over one and a

quarter square miles, and is appropriated to garden culture, which is deservedly celebrated in this part of Germany.

The land throughout the Hamburgh territory is in the hands of small proprietors, who live in their own houses, and cultivate their own soil. The size of the properties varies with the locality, as will be afterwards explained. There are no instances of farms let to tenants, on lease or otherwise, with the exception of the islets in the Elbe, which are State domains, and farmed by the lessees of the State under peculiar circumstances.

The law of inheritance in the Marschland district is, that where neither father nor mother has bequeathed the property to any one son, the eldest son takes it at a prescribed valuation, and pays the value of their respective shares to his brothers and sisters. In the Geestland district the same rule of inheritance is enforced by custom, with this difference, that the land to be divided is then estimated at the market price, instead of at an arbitrary legal valuation. When a father who is a landowner, becomes old or infirm, he frequently gives up the management to one of his sons, reserving a provision for himself and his wife during the remainder of their several lives.

Every landed estate within the Hamburgh territory must, according to law, have a page assigned to it in the State Register of Mortgages ("Hypothekenbuch"), on which it stands inscribed in the name of the proprietor, and on which all mortgages are entered in their order, so that the older mortgage takes precedence over those made later. The Register (although entitled the "Hypothekenbuch") is, in fact, one of both sales and mortgages; and only those persons whose names are entered on the register can have any legal rights to the property in question. Whether the sale of an estate is effected by private contract, or by public auction, it is not valid until duly inscribed in the State Register.

The cost of registering the sale or mortgage of an estate in the State Register Book is 6 marks currency (7*s.* sterling), and if merely a house or building, 3 marks currency (3*s.* 6*d.* sterling). There is a duty of 2 per cent. on the amount of the purchase-money, to be paid to the State by the vendor and purchaser in equal moieties. As no documents are required beyond the registration of the sale or mortgage, no further expenses need be incurred by either party concerned.

There are no Government Banks or public Companies which offer special facilities for raising loans upon landed property. There are, however, few estates within the Hamburgh territory which are not encumbered with mortgage debts. The State Register of Mortgages affords a good security to lenders, and a great deal of landed and house property is mortgaged nearly up to its full value. When a son takes an estate as before mentioned, subject to payments to be made to his brothers and sisters, their shares usually remain as charges on the estate. So, also, in cases of sale a portion of the purchase-money is almost always permitted to remain due upon mortgage security. The rate of interest is not fixed by law, and follows, in some measure, the rate of discount prevailing on the exchange. First mortgages at present pay 4 to 4½ per cent. interest; subsequent mortgages from 5 to 6 per cent.

The neighbourhood of a large city like Hamburgh has so great an influence upon the rural economy that a general system of cultivation can scarcely here be spoken of. The holders of small plots of ground raise chiefly vegetables for the city market. On the larger properties in the Geestland, a well-manured fallow is made to produce rye two or three times in succession, then oats once or twice, after which the land is allowed to lie fallow again, until it yields grass enough for cattle to be turned [illegible] and it is then manured, and in the next summer sown with potatoes, [illegible] always the chief crop; potatoes are planted merely for consumption on the farm.

The largest farms in the Geestland contain from [illegible] 150 Hamburgh scheffels, of 200 square rods, at 256 square feet to the rod, or from [illegible] to 186 English acres.* Upon these, from six to eight horses and twelve to twenty cows are kept. As cow-keeping, for the sale of fresh milk, is very profitable, most of the farms comprise good pasture land. The [illegible] have been mostly inclosed and divided amongst the parties having [illegible] Regular serving-men are employed on each farm, who receive [illegible] mark 5*l.* 6*s.* to 6*l.* 4*s.* sterling) per annum. Day labourers are not [illegible] in harvest time, they receive, on an average in summer, 1 mark 8 [illegible] sterling), and in winter 1 mark 4 schillings (1*s.* 6*d.* sterling) per diem [illegible] board. Women are employed in field labour only during harvest time, and are paid rather lower wages than the men so employed.

In the Marschland, wheat, barley, and beans are cultivated in addition to rye and oats. The largest farms comprise about twenty Hamburgh morgens of 600 square rods at

* 1 Hamburgh scheffel equal to 1 acre 6 perches English.

196 square feet to the rod, equal to 46½ English acres* which are thus cultivated. On a farm of twenty-four morgens, fourteen morgens are kept under the plough for tillage, four are laid down in pasture, and six morgens are used for the production of Hay. Upon a farm of that size, from six to ten cows, besides heifers, and four horses are kept. The pasture in the Marschland is not sufficient for so many cows as in the Geest-districts. The farm-servants usually consist of two serving-men, a boy, and two maids. Day labourers are only employed exceptionally, and their wages are from 1 mark 4 schillinge, to 1 mark 8 schillinge (1*s.* 6*d.* to 1*s.* 9*d.* sterling) per diem. On the islets of the Elbe, which consists of grass-land, and produce nothing but hay and milk, very little labour is required to be employed.

It is not the practice to raise stock-cattle either in the Marsch or the Geest-land, the production of milk for the use of the city being found more profitable. The proportion between tillage and grass-lands is in the Geest-district as two to one; in the Marsch (exclusively of the Elbe-islands) the quantity of grass-land does not exceed one-fourth of the whole.

Machinery has hitherto been but little introduced into the Hamburgh farms, although some threshing-machines, worked by horse-power and steam respectively are to be seen. The small size of the farms would in many cases render the use of machinery an unnecessary expense.

Where wages are paid to day-labourers, it makes no difference whether they live on on the farm or not. If the farmer lets a dwelling to a labourer, he sometimes imposes the condition that the latter shall give him three or four days of work gratis during the the harvest time.

There is no emigration worth recording from the Hamburgh territory. Where it takes place, it is in individual cases only. The larger land-owners are in general very well off, and even among the smaller land-owners little distress is perceptible. Pauperism cannot be said to exist nominally among any of the classes who depend on agriculture.

The population of the Geestland being 42,508 souls, and its surface equal to 29,199 English acres, it follows that in that district there is about one inhabitant and a half to the acre. The Marschland contains 20,134 souls, and a surface equal to about 27,016 English acres, so that its population is in the ratio of nearly three-forths of an inhabitant to each acre. By the influx of artisans and other workmen the population of the Geestland has received an increase of about 15,000 souls in the last twenty years. The number of the peasantry, or actual cultivators of land does not increase, as the destructive principle of the division of the land among all the children *of a proprietor* is happily not here carried out.

The small proprietors in the districts referred to are a slow-thinking race of people, troubling themselves little about politics, and disliking changes of any description. The neighbourhood of the city however, and the new socialistic theories with which the heads of all classes of workmen have of late years been filled, have not been without their influence upon the labouring men in the agricultural districts. The proprietors as has already been stated, live comfortably, and some of them are wealthy; they are, however, rather addicted to grumbling, and whether the harvest be good or bad, they seldom express themselves satisfied, but seem reluctant to admit the fact that they are doing well,—a characteristic which belongs otherwise to the farmers of many other countries.

The above statement is given upon the authority of the Land Department of the [illegible]ment of Hamburgh. The remaining Queries relative to the situation of tenants and [illegible] inapplicable to the circumstances of the small Hamburgh territory, because, as [illegible]plained, the landed properties are not let out, either on lease or otherwise, and the [illegible]f landlord and tenant does not therefore in general subsist.

Bremen.

The territory of the Republic of Bremen comprises 4,671 geo[illegible] square miles, and is thus distributed:—

	Morgen.†
The town of Bremen [illegible]mprises	6,683
Vegesack and Bremerl[illegible]en	728
Total..	7,411
The rural districts compri[illegible]	90,384
The bed of the Weser	1,858
Total of territory	99,653

* 1 Hamburgh morgen equal to 2 acres 1 rod 12 perches English.

† 1 Bremen morgen equal to 2,572 square mètres French, or 2 roods 21 perches English measure.

The population on the 3rd of December, 1867, when the last census was taken, was as follows:—

	Souls.
The town of Bremen	74,574
Vegesack and Bremerhaven	12,515
Total	87,089
Rural districts	22,789
Total population	109,878

The prevailing religious confession is that of the established Lutheran Church, and the occupation of the people are principally commercial, the agricultural population being comparatively small, and the only manufactures of any consequence being shipbuilding at Bremerhaven, and distilling and cigar making in the city of Bremen.

The whole of the land in the Bremen territory is in the possession of the cultivators of the soil, with the exception of a few isolated cases in which leases have been granted. There are 3,229 distinct properties, varying in extent from 5 to 1,000 morgen, as the following Table will show:—

Size of Farms.	No. of Farms.	Size of Farms.	No. of Farms.
Under 5 morgen ..	1,647	From 150 to 200 morgen ..	88
From 5 to 20 „ ..	671	200 to 300 „ ..	41
20 to 50 „ ..	368	300 to 500 „ ..	10
50 to 100 „ ..	239	500 to 1,000 „ ..	2
100 to 150 „ ..	162	Of 1,000 and upwards ..	2

The division of property on the death of the owner follows the prescription of the Roman law. The freehold farms in the rural districts cannot be divided, but the owner is at liberty during his lifetime to appoint one of his children as his successor, either by deed or by will. In case of intestacy the property falls to the eldest son; should there be no sons, to the eldest daughter, or to the nearest male descendant of the former proprietor. Should there be no descendants, the Roman law of succession comes into force, and the legal heirs are bound either to agree upon some one of their number as successor to the property, or to sell the same. The co-heirs of the new proprietor (the number of whom is prescribed by Roman law) must receive compensation from him, amounting in full to from one-fourth to one-half of the value of the property, according to their number. On the dairy farms ("Meierguter") which are subject to a law of divided ownership (which properties are, however, on the decrease, owing to the extinction of seigneurial rights), the law of descent is the same as upon the freeholds; in the absence of descendants the property falls to the seigneurial lord on the death of the owner.

The sale of landed property takes place only by a judicial decree based upon a contract of sale, or upon inheritance. The expenses of the sale amount altogether to $1\frac{3}{8}$ per cent. of the value of the property, including a duty of 1 per cent. to the State Treasury.

The rate of interest paid for mortgaged property varies from 4 to 5 per cent. according to the value of the property and the security of the [illegible]. The mortgages costs a quarter of a dollar, or 10*d.* sterling.

The principal crops cultivated are rye, oats, and [illegible], which are planted in rotation. The grass-lands of the Bremen territory [illegible] about 1001 lbs. of hay annually.

[illegible] of the State the distribution is as follows:—

Description.	Morgen.		
Buildings and courtyards	2,894	Heath	[illegible]
Fields, vegetable, and arable land ..	33,859	[illegible]	[illegible]
Pastures	11,550	Streets, [illegible] dykes, and water	[illegible]
Meadows	32,806		
Woods	1,113	Total	[illegible]

As a rule the husbandry is carried on without the aid of machinery. Unmarried servants, who live with their employers, receive from 30 to 50 Bremen dollars (5*l.* to 8*l.* 2*s.* 6*d.* sterling) per annum, including board and lodging. Day labourers receive from $\frac{1}{4}$ to $\frac{3}{4}$ of a dollar (10*d.* to 2*s.* 4*d.* sterling) per day, without board and lodging.

Women receive from 20 to 40 dollars (3*l.* 6*s.* 8*d.* to 6*l.* 13*s.* 4*d.* sterling) per annum, with board and lodging; but when working by the day they receive from ¼ to ½ a dollar (10*d.* to 1*s.* 8*d.* sterling) per day, without board or lodging.

According to the last census, the number of persons employed in agriculture was as follows:—

Members of occupiers' families (children and other relatives)	999 persons.
Hired servants	1,399 „
Day labourers	507 „

The number of females comprised in the list was—

In occupiers' families	504 persons.
Hired servants	810 „
Day labourers	121 „

Emigration occurs only in very rare instances among the rural population, and the small proprietors are generally in circumstances of sufficient comfort to support their families respectably.

The average population of the rural districts, according to the last census, is 29 inhabitants per Bremen morgen, or about 46 per English acre. The increase of the rural population within the present century will be seen by the following Table:—

Year.	No. of Inhabitants.	Year.	No. of Inhabitants.
1812	10,612	1864	21,977
1842	16,629	1867	22,789
1855	19,501		

The agricultural population is upon the whole very well satisfied with the present state of things.

The above statement is made upon the authority of a communication with which I have been favoured by the Government of Bremen.

Lubeck.

The territory of the Republic of Lubeck comprises five and a half geographical square miles. The population is 49,183 souls, and the prevailing religious confession is the established Lutheran. The people are chiefly occupied in agricultural and commercial pursuits, scarcely any other manufactures being carried on than those required to supply the wants of the inhabitants.

The system of land occupation is of a three-fold character. About one fourth of the territory is the domain of the State, and is let upon leases of 10, 14, or 20 years, the latter period being now the most frequent. Another portion is in the possession of independent landowners; and the remainder, about one-half of the whole, is the property of various persons, but is subject to the seigneurial control either of the State, or of the Corporations which have succeeded to the rights of former religious houses. This control does not, however, hinder the owners of such land from the full exercise of proprietary rights, subject to the formal consent of the superior Lord in the event of sale or transfer.

The largest estates belong to those persons above-mentioned, who enjoy undisturbed possession. One of these is equal in extent to 1,500 English acres; there are five others exceeding the size of 400 acres; while the farms on the seigneurial lands do not exceed 30 acres.

The laws regulating the descent or division of property depend upon the way in which it is held. As already stated, the independent owners have full liberty to sell or beqeath their property in whole or in part; but where seigneurial rights are exercised either by the State or a religious corporation, all changes of ownership must take place in accordance with the ancient usages. As a rule, the eldest son inherits the property on the death of the father but there are districts where the youngest son is the legal heir, while in others the father is at liberty to choose one of his sons to succeed him. In all cases, however, the new owner must arrange with his brothers and sisters as to their respective shares, and give proof of their consent to the authorities concerned before obtaining their sanction to his ownership, which is given in the form of a family settlement ("Hansbrief") and duly registered. Where such sanction is not required, there is no legally prescribed form of conveyance, but the assistance of a lawyer is generally taken advantage of to prepare a contract of sale.

The cost of preparing a family settlement varies, according to the size of the ground, from 1⅓ dollars (4*s.*) to 13⅓ dollars (39*s.* 6*d.* sterling); in addition to which a duty of 1 per cent. on the value of the property is payable into the State Treasury.

The rate of interest upon mortgages averages from 4 to 5 per cent. All mortgages are registered in a book kept for the purpose, for which a duty is payable of from one-quarter to one-half per cent. on the value of the property.

The crops raised are rye, wheat, barley, oats, pease, beans, tares, potatoes, and turnips. Those farms which are large enough to permit a rational system of cultivation to be carried out are generally divided into seven parts, each of which lies fallow for the first year. In the second year wheat or rye is raised; in the third, barley or oats; in the fourth, pease, beans, and potatoes; in the fifth, rye or oats; and in the sixth and seventh years, the land is laid down in grass. The portion of land used for grazing is only equal to one-fifth of the arable land.

No stock being raised or fattened for market, only those cattle are kept which are required for farm-work. The use of agricultural machinery has increased considerably of late years.

The farm-labourers usually live with their employers, but those who are married generally occupy cottages belonging to the estate on which they are employed, and secured to them by contracts, terminable by six months' notice on either side. Contracts for service are always made for a year, subject to three months' notice.

The wages of those labourers who live with their employers are from 40 to 50 dollars per annum (6*l.* to 7*l.*); women receive about half these sums. Those who live in their own cottages are frequently paid in kind, and the value of what they get may be estimated to amount to from 200 to 220 dollars (30*l.* to 33*l.*) per annum for a man and his wife. When day-labourers are employed they receive from 16 to 24 schillinge (1*s.* 2*d.* to 1*s.* 9*d.*), women, from 10 to 16 schillinge (9*d.* to 1*s.* 2*d.*) per day; but during harvest-time the wages often reach 1 dollar (3*s.*) per day.

Emigration occurs only in rare and isolated cases, and the scarcity of labour has led to the influx recently of immigrants from Sweden.

The small proprietors generally live in circumstances of great comfort, and the relations between landlord and tenant, where such exist, are very friendly.

The agricultural population is reckoned, on an average, as one family to every 100 Hamburgh morgen, or about 225 English acres.

The increase of the rural population is not so great as that in the town, owing to the town, owing to the desire which prevails to set up a home either in the town itself or its suburbs.

The relations existing between the occupiers and their labourers are generally of a very amicable nature, and no wishes have been expressed either by the Government or by the people for any alteration of the existing system.

The above statement is made upon the authority of a communication with which I have been favoured by the Government of Lubeck.

Schleswig-Holstein.

The Duchy of Schleswig covers an extent of 161 and that of Holstein 160 geographical square miles, together 321 square miles. The population, according to the census taken on 3rd December, 1867, was:—

.. ..	404,227 souls.
.. ..	577,491 „
.. ..	981,718 souls.

The people belong almost entirely to the established Lutheran Church, the exceptions being about 6,000 Catholics and 5,000 Jews. The industrial pursuits are chiefly agricultural; the manufactures established at Altona, Neumunster, and other towns being of small importance. There is a great deal of good arable land in the Dutchies on which crops of wheat, oats, and barley are raised, and also much pasture land belonging to dairy farms which supply butter and cheese to distant markets. The pasture in Ditmarsch and other marsh districts is very rich, and large numbers of cattle and horses are fed upon it. There are no longer any serfs or labourers compulsorily attached to the soil, the system of villenage having been abolished in the year 1805.

The greater part (certainly more than half) of the lands within the Duchies belongs to noblemen and other large proprietors, who parcel them out and let them to farmers upon lease. The rest of the soil is in the hands of peasants and small proprietors, who live upon and cultivate their own land.

The average size of the large estates is from 4,000 to 6,000 English acres.* There are, however, some larger properties. The largest estate in Holstein is that of Count Hahn, a highly-respected Catholic nobleman, at Neuhaus, which covers 10,000 acres. These estates are divided into farms varying in size from 100 to 1,500 acres; for instance, the estate of Quarnbeck, bordering on the Schleswig-Holstein Canal, the property of M. Schiller, comprises about 4,000 English acres. It is divided into the Mansion-house farm of 1,200 acres, two smaller dairy farms of 600 and 400 acres respectively, and five or six villages distributed into small farms of from 100 to 200 acres each. The whole of this land is let on lease at a rent of 13 Prussian dollars per tonne, or 39*s.* per English acre, inclusive of all services or demands upon the tenant. It is difficult to obtain a higher rate of rent; some farms are let rather lower, but for good land it may be taken as the present price. It was formerly the custom for the landlord to reserve, in addition to the rent, a supply of milk, butter, and other articles for the use of his household, but in modern leases this has seldom been done.

The farms are let on lease for terms of seven, fourteen, or twenty-one years; mostly for one of the two latter terms; at the end of which the proverty reverts to the landlord unless the lease is previously renewed. The tenant binds himself in the meantime to the due cultivation of the land according to the custom of the country. The lease is in general not assignable to a sub-tenant without the landlord's consent.

The farms are always let by written contracts in the nature of leases. Holdings of land at the mere will of the landlord, or from year to year by verbal consent, as in Ireland, are unknown in these Duchies.

The contracts in the nature of leases are not registered in any public office. The tenant has no legal right to keep possession under any conditions after his lease is out, nor can he sell his interest in the farm without the landlord's express consent. A valuation of the live and dead stock is made on the entrance of a new tenant, who pays for the same, and is repaid by the landlord when his term has expired and he gives up the farm.

The rent is reserved in money to the amount fixed in the lease. It is payable half-yearly, and mostly in advance. Where there is a difference of opinion, the amount of rent to be paid is fixed by the valuation of two competent persons, one named on each side. The landlord cannot raise the rent beyond the sum fixed by the lease. In case of non-payment, or of breach of covenant, the lease empowers him to evict the tenant, and the Courts of Justice will enforce that right, if appealed to. As against other creditors of the tenant the landlord can only enjoy such exceptional privileges as may be expressly stipulated in the lease, otherwise he is on the *same footing* as the other creditors.

Cases of compulsory eviction of tenants very seldom occur, The lease provides that all disputes relative to payment of rent or performance of covenants shall be referred to arbitration. Each party has to name either one or two arbitrators, who are to choose an umpire, and a Court of Arbitration is thus formed whereby such disputes are settled without much difficulty.

New buildings and other improvements are usually executed by the *landlord*, who of course is entitled to the benefit of them on the expiration of the lease. The tenant is only expected to make good such trifling wants of repair as may arise out of the ordinary wear-and-tear of the premises. The tenants have no means of procuring pecuniary assistance either from the Government or from any Government Bank within the Duchies, but the tenants not unfrequently obtain loans from private bankers. There is a Joint-Stock Bank at Flensburg, and a private Bank at Kiel, which are known to do considerable business in this way.

The relations between landlord and tenant in Holstein and Schleswig are generally friendly, and no legislative interference is called for. Some of the farmers are men of superior intelligence and possessed of capital. As regards both the cultivation of their farms and their standard of living they are, upon the whole a superior class to that of the peasants.

The mode of cultivation of the farms in question is as follows:—In the first year after the fallow rape-seed is sown; in the second year, wheat; in the third, barley; in the fourth, peas, beans, or vetches; in the fifth, oats; then the land lies in grass as pasture for three years, making a rotation of eight years, after which the fallow again succeeds. The so-called three years' course of husbandry has been almost wholly disused both by farmers and peasants in these Duchies.

Among the tenants who hold small farms in the villages the population increases more

* The land measure is the Holstein tonne, containing 240 square rods. As 20 tonne are equal to 41 Prussian morgen, and the Prussian morgen is equal to 2 roods 21 perches English, the tonne is very nearly the same size as the English acre.

rapidly than among the independent peasantry, which may be taken as a sign that the former class of persons is the richer of the two. There is very little emigration from these parts, and it cannot be said that discontentment prevails either among the farmers or the agricultural population. Under the existing laws no undue dispersion of land takes place, and the relations between landlord and tenant appear quite satisfactory. Neither the former Danish Government nor the Government of Prussia which now administers the affairs of the Duchies, has found it necessary to take measures for creating new freeholds, or for the limitation of proprietary rights.

With respect to the peasantry or small proprietors, the quantity of land held by them varies considerably. They may be divided into three classes, viz.; the full peasant ("bauer" or "hüffner"), who possesses about 100 English acres; the half-peasant ("halb-bauer"), who possesses 50 acres; and the small peasant ("kathner"), who holds a patch of land under the size of 15 acres. These small properties are very much intersected, especially where they lie in large villages; and the intersection is often found to be inconvenient and to increase the expense of cultivation. But no remedy beyond occasional exchanges has been suggested for such inconvenience.

The law of descent differs in different parts of the Duchies so much that no general law of descent can be said to be established. In some districts (that of Angeln in Schleswig for instance) the eldest son inherits, in others all the children have equal rights of inheritance, in which case one child usually takes the property and pays to the others the value of their shares, or gives them mortgages upon the estate. Sales as well as mortgages of land must be registered in the district register-book ("Hypothekenbuck"), and it is from the registration, not from deeds or contracts, that a title to real estate is derived. The costs of registration in the district-book consist solely of duties payable to the Crown, and amount to about 1 per cent. upon the value of the property. In the southern parts of Holstein the estates of the peasants are mostly mortgaged, and the interest payable thereon is at present from 3½ to 4 per cent. per annum; but in some districts, particularly in Angeln, the land is entirely free from incumbrances, and the peasant is proud of being the undisturbed master of his own little domain.

The crops are raised by peasants, and the rotation of their husbandry are much the same as those of the tenant farmers. The extent of meadow land throughout Schleswig and Holstein is equal to about one-fifth of the land under the plough; but cowkeeping is very profitable, and some of the dairy farms produce large quantities of butter and cheese for exportation. The small proprietors in Angeln and farther north in Jutland breed stock cattle to a limited extent; but this cannot be said to be generally done by the peasantry of the Duchies.

Some machinery has been introduced of late years, and threshing, sowing, and mowing machines are now to be seen on the properties both of the farmers and of the peasants. Hired labourers are sometimes employed in addition to the regular farm servants. A full peasant owning 100 acres usually employs five farm servants (of which two are females) who live in his house, and one or two day labourers for whom lodgings are provided. Of the three serving men, the best man receives as wages 40 Prussian dollars, or 6*l.* sterling, per annum; the next best 30 dollars, or 4*l.* 10*s.* sterling; and the third 20 dollars, or 3*l.* sterling. A day labourer receives in summer 12 schillinge, or 11*d.* sterling, and in winter from 8 to 10 schillinge, or 7*d.* to 9*d.* sterling, diem. A female labourer usually gets about 2 schillinge, or 2*d.*, per day less than the

[illegible] labourers are likewise provided with board as well as lodging.

There is [illegible]tion from the peasants' properties. Their dwelling-houses are mostly on their own la[illegible] they are well fed and clothed; and live on the whole very comfortably.

The aggregate population of the two Duchies of Schleswig and Holstein being now in round numbers about 1,000,000 souls, and the surface comprising rather more than 3,500,000 English acres, it follows that they contain one inhabitant to every 3½ English acres. The population of the agricultural districts is, as already mentioned, on the increase, especially in those villages where the land is farmed by good tenants. The increase is not so rapid as in the manufacturing towns. That the Duchies are essentially an agricultural country, and the inhabitants of the few towns which they comprise, such as Altona, Kiel, Flensburg, and Neumunster, bear but a small proportion to the mass of the population. The people of the Duchies are fully aware that, as compared with many other countries, they are, materially speaking, very well off. Farmers are everywhere disposed to grumble, and complaints of the pressure of taxation have been rife since the annexation of the country to the Prussian Monarchy; but the system of land tenure is not considered by the inhabitants as a grievance, or by the Government as in anywise calling for legislative reform.

The above statement has been prepared from information derived from managers of estates and other practical men who have resided in the Duchies, and from some personal observation.

(Signed) , JOHN WARD.

No. 2.

Mr. Jocelyn to the Earl of Clarendon.—(*Received October* 30.)

My Lord, *Stockholm, October* 22, 1869.

I HAVE the honour to acknowledge the receipt of your Lordship's circular despatch of the 26th of August last, directing me to cause a Report to be drawn up in reply to certain queries contained in that despatch respecting the tenure of land in Sweden.

I have requested Mr. Gosling, Third Secretary at this Legation, to make this report—his long residence in this country and intimate acquaintance with the language affording him special facilities for gaining accurate information in this matter.

Certain of the questions contained in the inclosure in your Lordship's despatch involve points which can only be explained and answered by a competent legal authority—different laws and customs as to the tenure of land prevailing in the several provisions of the kingdom.

Mr. Gosling has lost no time in seeking for the information required, but he informs me that, owing to the difficulty of obtaining reliable answers to some of the queries, and of testing the accuracy of many of the statements received, the Report can scarcely be ready before the close of the present year.

I have, &c.

(Signed) NASSAU JOCELYN.

No. 3.

Mr. Barnard to the Earl of Clarendon.—(*Received November* 9.)

My Lord, *Coburg, November* 6, 1869.

I HAVE the honour to transmit to your Lordship the inclosed answers to the queries relative to the laws and customs affecting the tenure of land in the Duchy of Saxe Coburg Gotha, conveyed to me in your Lordship's despatch of 26th August last.

I have, &c.

(Signed) CHARLES T. BARNARD.

Inclosure in No. 3.

Report relative to the Laws and Customs affecting the Tenure of Land in Saxe Coburg Gotha.

Name of Country.—Duchies of Saxe Coburg Gotha.

Population.—Coburg, 50,000; Gotha, 119,000.

Religions.—Protestant and Roman Catholic.

Industrial Pursuits.—Agriculture particularly; toys and plaything in wood and papier maché; weaving in cotton, wool, and linen; printed stuffs; basket making, both useful and ornamental; porcelain; stoves made with Dutch tiles; shoe manufactories; maps and geographical works; breweries; salted and pickled meats; hams and sausages; sawing, paper, iron, and other mills.

LAND OCCUPATION.

(A.) By far the greatest part is occupied by small proprietors.

(B.) Generally speaking tenants exist only—

1. On larger properties, and, in fact, on only those belonging to the Ducal House, and where there is a Manor House;

2. On properties belonging to the Church and Rectories;

3. On properties belonging to towns.

Sub-tenants under intermediate tenants scarcely exist. No statistical information is to be procured as regards the proportions of these several systems, but it is presumed that nine-tenths of all landed property is in the hands of land-owners, and one-tenth in those of tenants.

(A.)—Small Proprietors.

1. The quantity of land belonging to one land-owner differs greatly. The smallest property belonging to one owner, and who depends on the cultivation of it as the means of existence, may be rated at 60 acres, the acre,—equal $\frac{9}{16}$ths of the English acre,—equal $33\frac{2}{3}$rds English acres.

Whole properties lying together are very rare.

It is, indeed, at the present moment, the wish of the Government that all properties should in a great measure be divested of outlaying fields and be made more compact by the addition of others which are adjoining, in exchange for those at a distance, and at a valuation. This system has made great progress in Gotha. In the Duchy of Coburg the land-owners are so strongly opposed to this measure that it has been abandoned.

2. There are no particular laws as to regulating the descent and division of landed property on the death of the owner. The landed property is divided amongst the heirs according to their claims when the several parts do not prove to be too small for cultivation, if a division takes place.

3. The sale, transfer, exchange, or division of property must be transacted legally and entered in the public Register. The usual relative cost is little above 1 per cent. of the value of the property in question.

4. Loans can be obtained from the Government Fund, which furnishes money to an hypothecator. The conditions exact that the property be worth twice as much as the amount of loan, also that independently of the interest a certain sum be paid towards the gradual diminution of the debts. These loans are generally necessary for the payment of purchase-money or to satisfy the claims of heirs, or for the payment of debts incurred by former possessors.

5. The property of small owners are generally much burdened with mortgages, but there are many exceptions; there are districts of 3,800 acres, equal 1,687 English acres, which have not above 7,000 dollars, equal 1,500*l.* similar debts. Others, on the contrary, of from 1,400 acres, equal 787½ English acres, with 2,000 dollars, equal 3,000*l.*; some of 2,200 acres, equal 1,237½ English acres, with 56,000 dollars, equal 8,400*l.*, debts of mortgage. The usual rate of interest was until 1866, 4 per cent. but is now $4\frac{3}{4}$ per cent.

6. These mortgages are all legally registered by a magistrate, and the cost is 2 per cent. on small loans; or larger sums it amounts to 1½, 1¾, down to ⅓ per cent. on the amount of the capital.

7. Crops raised, winter—corn, wheat, and rye; summer—corn, barley and oats, peas and vetches, potatoes, beet, clover, esparsette, lucerne.

On small properties the (Dreifelder) or trienniel system is practised, viz.: wheat on [illegible] on [illegible] it two thirds of potatoes or beet, peas or clover, and one-third quite fallow.

Esparsette and lucerne always sown.

The above rotation is in great practice and considered to be the best, as giving the largest quantity of corn, (the principal and most valuable crop) independently of straw which furnishes litter, food, and manure.

In those districts, where the properties are compact, (having no outlying fields) the proprietors are gradually changing their system, and never sow two crops of corn in succession, in the same field, but always have a crop of peas, clover, or beet in the intermediate year. The fields are ploughed generally three times for wheat and rye, as also for potatoes and beet, but in a clayish soil, four times.

Where wheat and rye succeed a crop of peas, potatoes, or beet, the soil is only ploughed twice, and if the soil is sufficiently loose, only once.

For barley, oats, and peas, the soil is ploughed twice, viz.: once in autumn and once in spring. Ploughing is of course succeeded by harrowing, and if necessary, by rolling. When sowing barley, oats, and peas, the plough is used; for wheat and rye, the harrow.

On small properties, where only horned cattle are used for draught, the decrease by sale or otherwise, is replaced by breeding calves. Although generally speaking, many horses are bred in the country, particularly in the Duchy of Gotha, many people prefer buying foals which came from a distance, and can be bought at fairs held for the purpose.

The horses when much worked, are fed with oats, chaff, and hay, otherwise only with chaff and hay. Horned cattle are fed with potatoes, beet, and hay. Sheep when not on meadows, or downs, have hay and straw. Pigs are fed with spare milk, swill, groats, peas, and inferior corn.

The proportion of grass lands is one-twentieth to those of tillage.

8. There being no want of labourers, no machinery is employed on small properties. Owners of 25 to 34 acres have seldom servants or labourers: all work, both in the house and the fields, is done by the family. Owners of 35 to 70 acres have one man and one woman in the house, but no labourer. On properties exceeding 70 acres, there are, besides the house servants, labourers for field work and threshing.

Easy work, such as hoeing potatoes and beet, &c., hay-making, collecting corn when cut, digging potatoes, &c., is done by the wives and grown up daughters of the labourers. Where all manual labour in the fields is done by day labourers, one man with wife and grown-up daughter are sufficient for 80 to 100 acres.

Of the labourers who live in the house, and are fed, a man receives annually 35 to 50 dollars, equal 5*l.* 5*s.* to 7*l.* 10*s.*; a woman, 18 to 20 dollars, equal 2*l.* 14*s.* to 3*l.* 15*s.*

There is much difference between the wages of day labourers who have their own houses and the wages of their grown-up children living with them. There are daily wages paid either in money or *in naturâ*. For threshing, for instance, which is all done by hand, the labourer receives one-sixteenth of the corn threshed, which is a great help to a family, who has therefore not only bread, but also wherewith to feed a pig or two.

The rate for harvest work may be stated to be from 2*s.* to 3*s.* per acre for wheat and rye, and 1*s.* 6*d.* to 1*s.* 10*d.* for barley and oats. Some day labourers live with and are fed by the landowners, in which case a man receives 6*d.*, a female from 3*d.* to 4*d.* daily. If not fed by the landowner, a day labourer receives from 11*d.* to 1*s.* 2*d.*, a female from 7*d.* to 9*d.* daily. Generally speaking a day labourer with family is far from well off, if he does not possess a house and sufficient garden, or hired ground to enable him to grow potatoes enough for his family and for feeding a pig. Notwithstanding the pitiful state of such people, it is seldom that we hear them blame or reproach their employers; their only wish is to give up the agricultural life and to find work in some branch of industry. The result of this state of things is already felt in the scarcity of good day labourers in the country, and will naturally soon cause a claim for higher wages.

9. Emigration of such labourers to other countries is but rare, nor does it take place unless they or some of the family cannot find employment.

10. Small landed proprietors live, nearly without exception, on their property.

11. The usual way of life of small landed proprietors is generally plain, homely, and frugal in their wants; their dwellings are small and even if clean by no means comfortable. In most cases the whole family, with serving-people, live in one room on the ground floor. It is only in the houses of persons in better circumstances, that the serving-people have a room to themselves and do not take their meals with their employers.

In the upper story of these houses, the front side of which looks into the farm yard, there is a large room, but which is never used, perhaps for years except on occasions.

The food of such people is almost exclusively confined to those articles, which the property produces. The only meat they consume is salted or pickled.

The clothing of the small landholders is plain but well adapted to their occupations.

The dress of the women remains much more in the old fashion than that of the men. No change has taken place in it, the only appearance of luxury may be that of the stuff, which is, though still of the same colour, of a better quality. Their head-dresses remain the same.

This frugal and economical way of living has done much good, and to it must be ascribed the very evident amelioration of the peasantry. Their debts have been reduced, and many have even saved small fortunes.

12. No statistical information, as regards the average population per acre, and annual rate of increase of the population among small proprietors as compared with urban populations in their own country, and the annual rate of increase in other countries, is to be obtained. It is, however, presumed that there is a decrease in the former. The property of a small landowner may generally be computed at from 45 to 56 English acres.

13. The small proprietors of the middle-class of agriculturists are greatly respected. A number of substantial landowners cannot fail to be a great advantage to a country, where they purchase many articles for their own use and consumption, and thereby further trade and industry. The public revenue is a gainer by them, as the taxes they pay are sure and considerable. They are, altogether, respectable and very industrious people, and not disposed to take any part in acts of opposition.

(B.)—Tenants and Sub-Tenants under Landlords.

Tenure.

1. Generally speaking, there are only tenants on large properties, as little can be gained by the lease of small farms, and a tenant seeks therefore the lease of at least 450 English acres.

2. The duration of a tenure is from twelve to eighteen years. If the tenant dies during this time, and one of the heirs is willing and capable of undertaking the tenure, he is considered to have a claim to it, at least, as long as until the term is expired.

All cattle, implements, &c., are mostly the property of the tenant. He must give security for the punctual observance of the agreement. Sub-tenancies require the consent of the landlord.

3 and 4. Tenancies are created by written agreement. There exists no law as regards the duration of the lease where there is no agreement, neither as to leases being registered.

5. No law or custom exists whereby a tenant is considered as having a right to remain in occupation, so long as he punctually pays the stipulated rent. It is the custom for a landlord to announce publicly that a farm is to be let, and a day is fixed for receiving the different offers. He can by this means become better acquainted with the character and circumstances of each bidder before he makes his choice.

6. Neither law nor custom permit the sale of a lease without the knowledge of the landlord.

Rent.

1. Rent is usually paid in money, with security. It is seldom that security consists *in naturâ*, and even then, as an exception, only as regards a small part of it. A division of the harvest never takes place.

2. Rent is regulated by competition, sometimes by direct intercourse between landlord and tenant. Rent is to be paid quarterly, and punctually.

3. The agreement having been made for a certain time, the landlord has no right to raise the rent before its expiration.

The landlord generally reserves, in the contract, in the following cases, the right to evict a tenant, viz.:—when the rent is not paid within a year; when the tenant becomes a bankrupt; when he is convicted and sentenced to a degrading punishment; when he does not fulfil the conditions of the contract, and thereby deteriorates the farm.

4. There are no legal means by which the respective rights of proprietors and tenants for the recovery of rents and other claims can be enforced, neither does any law confer on the landlord any exceptional privilege over other creditors.

Evictions.

1. The landholder can only evict the tenant from his farm by law, and then only when the suit has terminated in favour of the former.

An agreement cannot be annulled before the term of the lease is expired, unless the tenant neglects to observe some condition stipulated in the lease.

When the lease is out the tenant must go. If a tenant neglects to pay rent for two years, the legal authorities will not permit him to remain in order to redeem.

2. It is seldom that steps are taken by landlords for the removal of tenants.

Improvements.

1 and 2. The terms of agreement on this subject are not the same in all contracts. In some, it is stipulated that the landlord, in some, that the tenant, shall pay for all improvements; in other, that the landlord and tenant together shall undertake them, but with the condition, that the landlord shall take charge of the whole, and receive one-third or one-half of the outlay from the tenant.

The improvements are, however, generally left to the tenant, except in the case of draining, where the landlord alone undertakes the work, on condition, however, that the tenant not only pays him the interest of the outlay, but, further, a yearly stipulated sum for each case of drainage, security being furnished by the tenant.

3 and 4. There is no law respecting the improvements which the tenant has made on the property. It is customary to have it specified in the contract, that the tenant should renounce all claims for improvements. This is the step taken in order to avoid groundless and exaggerated claims and consequent disputes.

5. There exist neither government nor private special companies or banks which advance money to tenants wherewith to make improvements. The tenant must, if he needs money, take the usual steps for procuring it.

Miscellaneous.

1. The relations between landowners and tenants, who always belong to the best class of farmers, are with few exceptions very good and friendly. The tenants are protected by the general laws. Particular laws are unnecessary and do not therefore exist.

2. The tenants, in comparison with the small proprietors, are much better educated in every way. They are also industrious and intelligent. They have generally been bred up in better classes.

3. No statistical information can be procured on this point, nor would it probable be of much interest, as the small proprietors and the tenants in the North and Middle Germany belong, although of the same vocation, to very different classes.

4. Emigration of tenants from one German State to another occurs frequently, as when their leases are expired they often remove to another State, but they seldom or ever leave Germany.

5. It is looked upon as a great advantage when large landholders who have generally no great knowledge of farming, have as neighbours, tenants on large property who can assist them. On the other hand it is to be regretted when small properties are in the hands of tenants, who without capital always deteriorate the land, and who if any misfortune befalls them are reduced to poverty.

6, 7, 8 and 9. The Government has always avoided to interfere in the manner in which the property of large and small landowners is administered, being confident that the owners will always know best what they ought to do, and that they will, *by* mutual discussions, make those alterations which they find most *necessary* and most conducive to *their interests.*

10. *Tenants wishing to become proprietors* of their own or of other holdings receive no pecuniary assistance from the Government. If they have earned sufficient capital they will never fail to find plenty of land which they can purchase.

11. The Government neither favours the accumulation nor the dispersion *of land,* except in the cases mentioned in No. I (A) small proprietors.

Copyhold.

No copyholds exist like those in England. Something similar is, however, known here viz., a copyholder ("Erb Pachter") is bound by contract to render different servic obligations; and he has not only the right to entail the property, but also to condition, however, that the property in case of the extinctio reverts to the lessor, who is equally entitled, in case of sale

The number of such copyholds is very small, nor h for many years.

Mr. Erskine

My Lord,

I HAVE the hono and Customs affecti Mr. Gould, Secretary Consul at the Piræu

As your Lordship desired me, in your Circular despatch of the 26th August last, to send in these Reports with as little delay as possible, I have thought it better to forward them by messenger at once, without waiting for the Reports from Her Majesty's Consul-General at Corfu and Her Majesty's Consul in Cephalonia, which have not yet reached me, but which I hope, ere long, to be able to forward to your Lordship.

I add likewise an interesting letter on this subject from Mr. Finlay, whose opinions on questions relating to this country are always deserving of attention. In alluding to the amount of the tax levied by Government on agricultural produce, which is known as dime or tithe, Mr. Finlay, I observe, speaks of the tax in question as being one-tenth of the crop, in kind. The fact however is, that the dime was reduced after the Revolution of 1862 to 5 per cent., but subsequently again raised to 8 per cent., and at a later period 1 per cent. was added to it, ostensibly for the construction of roads. The tax, therefore, now stands at 9 per cent. of the estimated value of the crop, and is levied, not, as would appear to be supposed by Mr. Finlay, in kind, but in money, like any other tax.

Although I fully agree with Mr. Finlay as to the inconvenience which arises from compelling the cultivator to wait until it may happen to suit the tax-collector to permit the removal of the crop from the ground, I do not see how the cultivator can run any risk from the competition of the collector in the local grain-market, as the tax is now levied, as I have already said, in money.

I fear that Her Majesty's Government will not find in the accompanying Reports any suggestions that could be usefully adopted in the settlement of land tenure in Ireland, but it is possible that in the Reports from Her Majesty's Consuls in the Ionian Islands there may be some point more worthy of attention, as the relative positions of landlord and tenant have always been a source of discontent in the Island of Corfu, and the question has recently, it is hoped, been settled satisfactorily by legislative enactment.

I have, &c.
(Signed) E. M. ERSKINE.

Inclosure 1 in No. 4.

Mr. Gould to Mr. Erskine.

Sir, *Athens, November* 3, 1869.

IN the accompanying Report on the tenure of land in Greece, which I have drawn up in obedience to the instructions conveyed to you in the Earl of Clarendon's Circular despatch of the 26th of August last, I have not, as you will find, attempted the difficult task of describing the conditions on which land is held in the Ionian Islands. The laws and institutions obtaining in these islands are very complex, and in many important respects dissimilar from those of the rest of the Hellenic Kingdom, and I have, therefore, preferred avoiding altogether a subject which Her Majesty's Consular Agents, from their long-continued residence there, and great local knowledge, will be so much better able to treat.

I hope you will kindly bear in mind that the inclosed Report, which is I feel very imperfect, and may possibly be incorrect in some matters of detail, has been drawn up under many and great disadvantages; such, for instance, as the shortness of my stay [illegible]reece, the fact of my being unacquainted with the Greek language, and the great [illegible] to the impossibility, peculiar to this country of obtaining, except by personal [illegible]se and reliable information on any one given point.

[illegible]imitive system of land tenure existing in Greece are, [illegible]ident to justify me in not having thought it necessary

I have, &c.
) G. F. GOULD.

[illegible]reece.

[illegible]hich is estimated at [illegible] taken in 1861, a [illegible]lation to the extent [illegible]nds in the propor-

tion of 24·143 to 153. Owing principally to the excessive mortality among children, the average duration of life is between 27 and 29 years, and consequently the increase of population proceeds at the comparatively slow rate of 0·90 per cent. per annum, notwithstanding that the number of births per marriage is 1·66 higher than in England. In the rural districts the mortality among the children is even greater than in the towns. It is accounted for by the ignorance and poverty of the rural population and the want of proper medical attendance.

Religions.—The vast majority of the population profess the Orthodox Greek religion, but there are a few Roman Catholics principally in the Islands.

Industrial Pursuits.—Greece has a considerable maritime trade, which has greatly increased of late years. Agriculture is, however, the principal resource of her inhabitants, more than half of whom are employed in the cultivation of the soil. Her manufactures are so few and unimportant as not to call for any special notice in the present report.

Land Occupation.

Barely one-seventh of the whole superficies of the kingdom is actually under cultivation, though, notwithstanding its mountainous regions, it is peculiarly adapted for an agricultural country, as it contains large plains, the soil of which is extremely fertile. During the domination of the Turks but few Christians possessed landed property—all the best lands having been appropriated by the ruling race. After the Greeks had achieved their independence, all the Turkish estates in the Morea, and in some other provinces, were confiscated and became the property of the new State; but in Attica, Eubœa, Phthiolis, and in general in the provinces which the Turks were subsequently compelled by Treaty to evacuate, they were permitted to sell to Christians all their private properties. These were bought up at exceedingly low prices, and it thus happens that in the latter provinces there are large landed proprietors, and that the peasants who, during the Ottoman rule, cultivated the lands belonging to Turkish proprietors, are now, if possible, in a worse position that before, for they have merely exchanged wealthy, and generally speaking, liberal for needy and exacting landlords for whom they are obliged to work on precisely the same terms as formerly.

The lands owned by the State occupy nearly three-fourths of the whole extent of territory suitable for cultivation, and at different times has been proposed to portion them out among the peasants. However, in spite of the many evident advantages to be derived by the country from the adoption of such a measure, no attempt has hitherto been made to put it in practice. A law was passed in 1836 conferring on each family of Hellenes the right to purchase from the State at public auction 120 stremas or 30 acres of land. For this purpose the Government was authorized to grant to the head of each family a credit on the Treasury to the amount of 2,000 drachmas (71*l.* 8*s.* 7*d.*). This sum to be reimbursed in 36 years at the rate of 6 per cent. interest and sinking fund. All sums above this amount were to be repaid in 10 years, and to bear 8 per cent. interest if they exceeded 6,000 drachmas (214*l.* 5*s.* 9*d.*). In a financial point of view the measure proved a complete failure—its principal object having been rather to relieve the necessities of the Public Treasury than to increase the class of small landed proprietors.

The lands put up to auction fetched such high prices owing to local causes, and the underhanded proceedings of the authorities, that the purchasers have since been much unwilling to meet their engagements. On the subject being again brought [illegible] in 1855, a new law was passed remitting all arrears due up to that date. This measure seems to have proved as great a failure as the first, and it is highly problematic whether the State will ever recover the large sums owing to it under this head. The original law, known as the Law of Dotation, has long since fallen into disuse. The Government submitted to the Legislature in 1864 a Bill to leave the peasants in possession of their present holdings on the condition of their reimbursing to the State the price of the land at a moderate valuation. Though five years have elapsed since this Bill was first brought forward, no decision has yet been come to upon it.

Out of a total of upwards of 5,600,000 of acres of productive land but 1,800,000 are said to be under cultivation. This is mainly to be attributed to the smallness of the agricultural population, which does not number above 600,000 or 700,000, divided into 150,000 families, each averaging from four to five individuals. About one-third of those families is possessed of land, and, as far as can be ascertained, the proportion between the large and small proprietors may be assumed to be one of the former class to sixteen of the latter. The scarcity of population, the want of capital, and the superabundance of land, all combine to make it impossible for the large proprietors to find tenants in the English acceptation of the term. They are consequently compelled either to cultivate their

properties for their own account with the assistance of hired labourers, or to enter into a kind of partnership with the peasants, from whom they receive a certain fixed share of the produce, which varies according to circumstances. The latter system, known as the system of having "collegas" (colleagues or co-partners), is almost universally resorted to in the ancient provinces of the kingdom, with the exception of Eubœa, Phthiotis, and Attica, where there are very extensive estates which can be more advantageously cultivated by the owners themselves.

The Government lands are farmed in the collega plan, but the position of the peasants settled on them differs in one very essential point from that of the collegas on private properties, for whereas the latter can under no circumstances establish a legal claim to the portion of land they cultivate, the former acquire absolute proprietary rights to any part of their holdings on which they may have made improvements of a permanent nature, such, for instance, as buildings or plantations, with a strange want of foresight, and scarcely to be expected in so sagacious a people; the peasants are expressly forbidden by law from thus enhancing the value of their farms in a country where fully two-thirds of the soil lie waste, and are consequently valueless, although the State is directly benefited, since it receives a considerable share of whatever increase may be obtained in the produce of the land. However, within the last few years all attempts to enforce this law have been abandoned, owing more to the inability of Government to cause it to be observed, than to any rational change of policy on its part.

Small Proprietors.

It is difficult to state with any thing like accuracy the quantity of land usually held by small proprietors, for it is well known to vary very much in different localities, and there is but scanty and often conflicting information to be obtained on this point, as on most others connected with the tenure of land in this country. At a rough calculation small proprietors hold each on an average from 15 to 25 acres, while considerable numbers of peasants in different provinces possess from 40 to 50 acres, and in some exceptional cases even a larger amount; many of the small proprietors in the islands do not own more than 1 or 2 acres, and upwards of a hundred different landowners proved their claims for compensation in the five or six miles of country crossed by the line of railway from Athens to the Piræus, although part of the land required was national property. The greatest inconvenience and frequent lawsuits arise from the manner in which these properties intersect each other. Moreover, none of the usual precautions are adopted to mark the limits of the different properties, which, in the absence of any reliable land survey, are often very vaguely described in the title-deeds. The necessity of legislative interference to remedy this deplorable state of things is urgently felt, for it tends in a marked degree to depreciate the value of land.

Law of Succession.—In cases of intestacy real property on the death of the owner is equally divided among the children or nearest relatives. When there is a will the testator can only reserve for his disposal a share of the estate equivalent to that which, after an equal division, descends by right to each of his direct heirs. No distinction is made between males and females; but generally speaking, when feasible, a female is indemnified for her share of the land by being paid the money value of it, or by holding a mortgage of proportionate value on the whole of the estate.

Sale and Transfer of Land.—The legal method used for the sale, transfer, exchange or division of property is by a distinct conveyance executed before a public notary on stamped paper, and subsequently registered in a special Government office, in which all mortgages have likewise to be recorded. Every time any of the above transactions take place the deed of conveyance must contain a full and accurate description of the title-deeds under which the property was originally held. The usual cost is 2½ drachmas (1*s.* 5¼*d.*) per thousand (35*l.* 18*s.* 9*d.*) up to 100,000 (3,593*l.* 15*s.*); but no further charge is made whatever may be the amount involved in the transaction.

Mortgages.—No special facilities are afforded by Government for raising loans upon landed property. Nevertheless, the National Bank makes advances on mortgages from 8 to 12 per cent. per annum, according to the value of the security given, and the terms of the special agreement entered into with the mortgagees. The returns derived from land in Greece are so small and so precarious that those solely dependent on them can scarcely avoid being involved in pecuniary difficulties, and their properties are, therefore, often very heavily mortgaged. But whatever may be the object for which money is raised in this way there is good reason to fear it is very rarely, if ever, applied to improvements. The present system of levying tithes, and of tenancies on shares, act as a most effectual bar to any improvements landlords might otherwise be willing to make, for, while they alone

would have to bear the whole outlay, more than half the benefits to be expected from such improvements would under the most favourable circumstances fall to the share of the State and the tenants; were the tenants to invest capital in improving their farms they would find themselves at a still greater disadvantage, since not only would any additional profits have to be divided with the State and the landlords, but the tenants would have no legal claim to be indemnified for the improvements thus effected by them. Without going so far as to take into consideration the prevailing insecurity of life and property in the rural districts, and the want of the ordinary means of communication, the defective system in force with regard to the mode of taxation and the tenure of land amply account for the present backward and impoverished condition of the country.

It has been remarked that the properties cultivated by the peasants themselves are generally less encumbered than the rest.

The only formality required to legalize mortgages consists in causing them to be recorded in a register specially kept for the purpose, in the same Government offices where all other transactions connected with land have to be registered. This book is always left open for public inspection, and contains an accurate account of the exact position of each landowner. The expense attending this very simple proceeding only amounts to 1 drachma ($8\frac{5}{8}d.$) per 1,000 drachmas, but 5 drachmas ($3s.\ 7d.$) is the highest charge made on any single transaction.

Mode of Cultivation.—Anything more primitive than the present mode of cultivation in Greece can hardly be conceived to exist in any other part of the world, and as yet there are but few very partial signs of improvement in this respect. The natural fertility of the land is, however, such that it yields abundant crops, although no care whatever is taken in the cultivation. The advantages of manure seem all but unknown, and the rude ploughs in common use barely do more than just turn over the surface of the soil. As in the very earliest ages, the corn is threshed in the open fields by means of oxen or horses dragging after them a triangular platform weighted with men standing upon it.

In certain favoured localities the crops alternate on the same land, Indian corn or maize being planted after the earlier sorts of wheat or barley have been cut; but this plan cannot long be persevered in with advantage, as it is found by experience completely to exhaust the soil. The general practice is to allow the land to lie fallow every second year, and sometimes even to let it remain in that state two years out of three.

Wheat, maize, barley, and rice are produced in considerable quantities, as also tobacco, ma[illegible]er, sesame-seed, opium, and especially cotton, the cultivation of which has extended of late years; but currants form by far the most important and indeed the staple article of Greek commerce. The production of this fruit has recently increased at so rapid a rate as to cause a very marked decline in the prices, which now leave the pro[illegible]r but comparatively small profits. The returns yielded by currants are very uncertain, no precautions being taken to prevent the rain from causing the fruit to ferment while dry[illegible]g in the sun after it has been picked, it often occurs that the crops is partially dam[illegible]d and sometimes even totally lost.

Stock.—The stock owned by small proprietors generally consists of a few sh[illegible]p [illegible] goats. These are allowed to graze in winter on that portion of their properties which may then be lying uncultivated, or on the waste lands belonging to the State or to the community of which they form part. It is as well to notice here that many vill[illegible]

except at harvest time, when females are occasionally found willing to work on condition of being employed in gangs by themselves.

On an average each labourer is supposed to be able to cultivate 60 stremas, 15 acres. This fact alone proves how very backward the state of agriculture must still be in Greece.

The average daily wages of the agricultural labourers vary from 2 to 2½ drachmas (1*s.* 5¼*d.* to 1*s.* 9½*d.*), in addition to food and a liberal allowance of wine. When permanently employed their monthly wages amount to only from 15 to 25 drachmas (10*s.* 9¼*d.* to 17*s.* 11½*d.*), with wine and food included. In the latter case only do they live with their employers, and it is doubtful whether there are many who find themselves in this position. As has already been mentioned, females are very seldom hired, and then their daily wages average 1½ drachmas (1*s.* 1*d.*)

Not only do these labourers not emigrate but they rarely seek for employment out of their own districts.

Condition of the Small Proprietors.—The small proprietors almost invariably live in the villages adjacent to their properties, and, taking into proper consideration the climate and their extremely frugal and parsimonious habits, they may be said to be in general tolerably well-housed and fed. Their style of living is, however, such as would be totally unsuited to the natives of almost any other portion of Europe. Their cottages usually contain but one room and hardly any articles of furniture, especially beds and tables. Their ordinary diet is composed of wine, bread, onions, olives, and fruit, and they seldom eat meat (mutton or goat's flesh) above once or twice a month. When their crops have failed they have been known to subsist for months together on the scanty herbs they were able to pick up. They are both warmly and comfortably clad for the climate, and generally appear to be in comparatively easy circumstances. Whatever may be the amount of money they possess it does not in any way cause them to alter their mode of living; they either bury it for the sake of security or lay it out in the purchase of additional land. Recent instances have occurred of extensive estates having been purchased by the peasants in the adjacent villages without any apparent difficulty on their part in finding the requisite amounts, which have generally been paid off before the stipulated term. Greeks, as a rule, have a decided repugnance for agricultural pursuits, which are looked upon by them as degrading, and only fit for the utterly uneducated. The natural consequence is that, as education becomes more general the rural population tends to decrease, owing to the ever increasing numbers of those who consider themselves able to make their way among the townspeople.

Tenants.

Tenure.

The quantity of land held by each tenant is about 60 stremas, 15 acres.

The agreement entered into between landlords and tenants under the system in force in Greece, the leading incidents of which have already been described, is of the nature of a deed of partnership, liable to be dissolved at any moment by either of the parties to it. In return for usufruct of the land, which the tenant undertakes to cultivate under certain stipulated conditions, the landlord receives a certain fixed share of the produce.

Sub-tenancies do not exist, but could not in any case be assigned by the tenant unless

tenants to enable them to meet the expenses of cultivation receive one-half or two-fifths of the gross produce. When the proprietors of arable lands furnish the seed and the oxen required for ploughing, one-tenth of the produce is first deducted to meet the taxes (the tithe amounts to 8, and the local imposts to 2 per cent.), and they then receive from the tenants one-half of the remainder, besides the quantity they may have supplied as seed. When the proprietors merely provide the land, they receive, according to its quality, from 10 to 20 and sometimes as much as 25 per cent. of the produce, after the amount due as taxes has bee deducted. The average is, however, 15 per cent., which is the amount paid by tenants on all Government lands. At the time the crops are gathered the amount to be deducted therefrom as rent and taxes has to be levied on the spot by the proprietors or their agents before the tenants can dispose of any part of them. Any infraction of this ancient and universally recognized custom exposes the tenants to a heavy penalty.

In the total absence of competition for land it is not the interest of landlords to change their tenants, and the rent is calculated on such a scale that any attempt to raise it would, in most cases, lead to the loss of the tenants.

The duty of enforcing the respective rights of proprietors and tenants, founded to a greater extent on local usage than on law, rests with the regular Courts; but the administration of justice is extremely imperfect, and the decisions of the Courts are often evaded.

The landlords are by law and custom in the position of privileged creditors, the full amount of their claims on the produce of the land having to be satisfied before any part of it can be disposed of for the benefit of other private creditors.

Evictions.

No notice has to be served on tenants, who are at all times liable to be evicted, as previously stated; and in case of resistance the landlords would be justified in at once calling upon the local executive authorities to assist them. Practically such evictions are extremely rare, owing to causes which have already been fully described.

Improvements.

Under the present system of tenure of land improvements, especially buildings, are seldom executed by either landlord or tenant, as there are but few inducements for them to incur any expense not absolutely required.

The landlord, upon resuming possession, has a legal right to the improvements made upon the farm by the tenant. Therefore the latter, unless secured by some special agreement, can have no claim to be indemnified for any improvements he may have executed. However, when trees or vines have been planted on the farm by the tenant, he has, strictly speaking, on giving up possession, the right to destroy any such plantation, unless he can obtain fair compensation either from the landlord or from the incoming tenant.

Miscellaneous.

The relations between landlord and tenant [illegible] possess exclusive tracts of land, and in some exceptional instances even forests, [illegible] constitute the common property of all the villagers. In the summer months [illegible] are driven up into the mountains for pasture, as almost every vestige of vegetation in the plains then disappears under the scorching rays of the sun. In the early spring [illegible] are sometimes allowed to feed on barley before it comes into ear; but there are no grass lands owing to the want of water.

Agricultural Machinery.—As far as can be ascertained only one attempt on a large scale has yet been made to introduce machinery for agricultural purposes, and that has to all appearances hitherto proved a failure, in consequence of the manifold difficulties, which must necessarily at first beset an undertaking of the kind in a country so backward in most respects as Greece. In one or two provinces some foreign improved ploughs are stated to have been successfully brought into use with the assistance of Government.

Agricultural Labourers.—The small proprietors usually cultivate their own land with help of their families, the females doing most of the lighter kinds of field work. At the time of gathering in their crops, when additional labour is often required, families inhabiting the same village mutually assist each other, and thus obviate in general the necessity of having recourse to hired labour. This class of proprietors very seldom employ hired labourers. On the contrary they not unfrequently work for the large proprietors, whenever they can find leisure to do so. Hired female labour is scarcely ever to be obtained,

hardly be said to exist, and in any case it has no weight whatever. The urgent necessity of abolishing the tithes, of modifying the prevailing system with regard to the tenure of land, of putting an end to the present deplorable insecurity of life and property, of improving the administration of justice, of obtaining an accurate cadastral survey of the country, and of making roads, is universally recognized; yet, strange as it may seem, no serious attempt is ever made by succeeding Governments to introduce any of these useful measures.

Copyhold.

The position of the peasants settled on the Government lands may in some measure be compared to the copyholders in England, since they have practically become irremoveable, and moreover acquire proprietary rights to the land on which they may have erected buildings or made plantations.

(Signed) G. F. GOULD.

Inclosure 3 in No. 4.

Report by Consul Merlin respecting the Laws and Customs affecting the Tenure of Land in Greece.

Population.—According to the last census taken in 1861 to 1862, the entire population of the Kingdom of Greece was as follows, viz.:—

	Inhabitants.
Continental Greece	318,535
Peloponnesus	552,414
Island of Eubœa and the Cyclades, &c.	225,861
Ionian Islands	228,669
Making a total of	1,325,479

Of whom 689,737 were males and 635,742 females.

Religion.—The national religion is that of the Greek Orthodox Church. All other religious creeds are tolerated, but proselytism is forbidden by the First Article of the Constitution.

According to a statistical work published in Athens by Mr. A. Mansola in 1867, the population of Greece Proper is divided into the following religious sects, viz.:—

Members of the Greek Church	1,060,900
Christians of other denominations (principally Roman Catholics)	9,358
Other religions	552
	1,096,810

No official statement of the population of the Ionian Islands, as regards its division into religious sects, has been published; but the great majority, in those Islands, belongs also to the Greek Church.

Industrial Pursuits.—The following is an Official Return of the various industrial employments of the inhabitants of Greece Proper; according to the census of 1861:—

Landed proprietors	16,122
Mechanics	32,801
Agriculturists (small proprietors)	147,507
Shepherds [illegible] ..	38,953

the consent of the landlord.

The tenancy is sometimes created by parole, but in most instances by a written agreement passed before a public notary, who retains the original document in his possession and only furnishes the parties concerned with copies of it. When there is no agreement the law, founded on custom, presumes the tenancy to be from year to year, expiring when the crops have all been gathered in; that is to say, in the month of August, unless exceptional circumstances can be adduced by the landlord to justify a departure from the recognized practice, though in theory the tenant is merely a tenant-at-will.

There is no law where under-tenants are entitled to retain possession of their respective holdings merely on regular payment of the stipulated amount of rent.

There is likewise no law where under-tenants are considered as having a right to sell their interest in their farms without the consent of the landlords.

Rent.

In the case of tenancies the payment is made to the proprietor, by a fixed share of the produce. That share varies considerably. The proprietors of currant vineyards, besides being reimbursed the amount of any advances they may have had to make to the

The population of the Ionian Islands is divided as follows; into—

Agriculturists	51,342
Mechanics	8,365
Commercial pursuits	7,282

Adopting the system of M. Legoyt, and arranging the industrial population of Greece under six general divisions, M. Mansola adduces, that, for every hundred male adults, there are—

Large proprietors	4·27
Mechanics	13·87
Agriculturists, including shepherds	49·37
Persons engaged in commerce	8·43
Liberal professions, including students	18·66
Servants of both sexes	5·40
	100

From which it results that by far the most numerous class in Greece is that employed in agriculture, most of whom cultivate their own property.

Land Occupation.

The superficial extent of the Kingdom of Greece (not including the Ionian Islands) consists, it is calculated, of about 45,000,000 to 47,000,000 of stremmata, or 11,500,000 to 12,000,000 of acres, and is divided, in an agricultural point of view, as follows, namely:—

	Acres.
Cultivated lands	1,920,000
Lands capable of cultivation	3,100,000
Mountains and natural pastures	4,700,000
Woods and forests	1,400,000
Lagoons and marshes	215,000
Towns, villages, roads, rivers, &c.	426,000
Say, together	11,761,000

From which it appears that only about a sixth part of the entire extent of the Hellenic Kingdom is at present cultivated, though half of the remaining portion is either susceptible of tillage, or could be rendered so by skill and labour.

Although the War of Independence terminated in 1829, and Greece has been governed by an European form of Monarchy for nearly forty years, no general cadastre has yet been made of the kingdom, nor is the exact proportion and extent of the national lands known.

It is, however, roughly estimated that about one-third of the cultivated, and one-half of the waste districts, are still the property of the State.

On the expulsion of the Ottomans from the Peloponnesus, the greater portion of the land there became national property—while in Continental Greece and the Island of Eubœa, which was ceded by Treaty, the Turkish tenants are said to be in general the most valuable kind.

Owing to the great difficulty experienced in most parts of the country in finding peasants to cultivate the land, the proprietors, as a class, are practically at the mercy of their tenants, for whose protection, therefore, no Legislative interference has hitherto been found necessary.

The position of the small peasant proprietors differs in point of fact so slightly from that of the tenants ("collegas"), that in almost every respect the two classes are similar. The latter, however, as a rule, are naturally in less easy circumstances, since a share of their profits goes to the landlords.

There is no statistical information as to the annual increase in the population among tenants, as compared to small proprietors,

The desire to possess land is very general; but tenants are not assisted in any way in whatever efforts they may be induced to make to become proprietors of their own holdings, or of other land.

The laws in force tend to favour the dispersion of land, as almost every time it changes hands it has to be subdivided among the descendants of the preceding owners.

The attention of public men is so exclusively engrossed by politics that the material interests of the country are shamefully and systematically neglected. Public opinion can

The arrears due to the Government for national lands sold and for taxation, arising principally from the cultivation of the same, now amount, in round numbers, to the sum of 80,000,000 to 100,000,000 of drachmas (2,857,143*l.* to 3,571,428*l.*).

But nearly the entire nation being interested in postponing a settlement of this debt, it is hardly probable that any Chamber of Deputies will be found willing to pass a law enforcing payment of it, or depriving the present possessors of their land; whether acquired by legal purchase from the State, or appropriated without permission.

The opinion, therefore, generally entertained is, that the Government will eventually be obliged to accept the present condition of affairs, and recognize the proprietorship of the actual possessors of the soil, on the payment of the estimated value of the land as it was forty years ago—which, of course, will be nearly nominal.

In consequence of the large proportion of uncultivated land, and the comparatively small number of inhabitants, the system of land occupation in Greece will not bear comparison with that of the more populous countries of Europe.

Agriculture in Greece Proper is chiefly carried on by small peasant proprietors.

Tenants holding under large proprietors and paying cash rent are very rare.

There is no class of skilled agriculturists or farmers in Greece renting farms, or cultivating other persons' property, corresponding to that class in England. Sub-tenants under intermediate tenants holding from proprietors, are unknown.

The proportion of small peasant proprietors to large may be estimated at about thirty of the former to one of the latter.

(A.)—Small Proprietors.

Landed property is divided into very small holdings, especially in the Islands of the Greek Archipelago, where there are proprietors having only two or three acres, and even less. In the plains, proprietors exist holding 15 to 20 acres. Very few, however, possess more than 260 acres.

In the absence of precise statistical information on the subject, it is difficult to ascertain the average quantity of land held by small peasant proprietors in Continental Greece and the Island of Eubœa. It is usually termed a "zevgaria" (that which can be ploughed by a yoke of oxen). This, however, is a vague definition, and may vary from 10 to 50 acres, according to the nature of the soil, district, &c. It rarely happens, however, that this class of proprietors, who are the most numerous in Greece, hold more than 100 acres, of which only a small portion is cultivated each year, and the remainder allowed to lay fallow.

In the Islands of the Greek Archipelago, the small proprietors are frequently divided into separate plots consisting of a quarter to half an acre, and even less, intersected by those belonging to other parties.

The proprietors generally employ one or two beasts of burthen, besides their oxen, either ponies or donkeys, for the purpose of going from one plot of ground to another, and likewise to carry their ploughs and agricultural implements, and this is particularly the case in the neighbourhood of towns.

Across the division of real and personal estate in

Students (female)	377,659

No legacy-duty is charged by the State on property descending in the direct line, namely,—children and grandchildren. Indirect heirs pay according to their degree of consanguinity; the maximum charge being 4 per cent.

3. Free-trade in land may be said to exist in Greece. The legal method used for the sale, transfer, or exchange of landed property is by notarial contract, signed before two witnesses; and this act must be subsequently registered in the Official Registry of the "Demos" or municipality. The notarial charge is $2\frac{1}{2}$ drachmas per 1,000 drachmas; that for registry is 2 drachmas (1*s.* 6*d.*) for the first sheet, and 1 drachma (9*d.*) for the remainder. One-half of the fee belongs to the public notary and the other to the State. There is no other charge on the sale of landed property in this country.

4. There are no agrarian banks in Greece, though several attempts at establishing them have been made. The National Bank is obliged, by its charter, to appropriate two-thirds of its capital for the purpose of assisting landed proprietors with loans and mortgage, and has obtained considerable privileges in return, as regards judicial procedure in the recovery and enforcement of debts, and the sale of real estate, by which that establishment is saved much litigation. This amount having proved, however, insufficient for the requirements of agriculture, on the renewal of the charter of the National Bank in 1861, the Government authorized a further increase of its capital by 2,000,000 of drachmas (71,429*l.*) on the express condition of its being exclusively appropriated to loans to landed proprietors on personal security, without mortgage.

It was, moreover, stipulated that, whenever an agrarian bank is established, the National Bank shall contribute one-third of the capital, and thus will be released from the above obligations.

Complaints are, however made, that the National Bank has, wrongly, contrived to evade, in a great measure, these engagements, and that only the large and influential proprietors have benefited by them.

The truth is, small proprietors have little security to offer, and are consequently obliged to have recourse to money-lenders and usurers, to whom they pay from 12 to 18 per cent. interest per annum, and sometimes, it is said, even much more. This being the case, but few improvements in landed properties can either be made or expected.

5. About three-fourths of the landed property in Greece is mortgaged for its full saleable value. The rate of interest varies from 8 to 12 per cent., the latter being the legal rate of interest in this country.

6. A written application in duplicate has to be made to the *Official* Registrar of Mortgages in the demos or district, who is appointed by the Government. The cost of registry is 1 drachma (9*d.*) per 1,000 drachmas (36*l.*), and 50 lepta ($4\frac{1}{2}d.$) for every additional 500 drachmas (18*l.*), beyond which sum no extra charge is made. The registry is open to public inspection and a certified extract from it can at any time be procured on the payment of 2 drachmas (1*s.* 6*d.*).

7. The crops raised in Continental Greece and the Island of Eubœa consist of wheat, barley, oats, maize, sesame, beans, cotton, flax, tobacco, madder-roots, &c. Where the land can be irrigated and the soil is particularly good, maize or sesame are sometimes planted after the barley has been cut in the month of May. In parts of Western Greece, if the cultivators can procure manure, they have occasionally a second year of wheat, on ground that has long lain fallow, then barley, then oats, which last is considered nearly as good as fallow. But on light soils, such as Attica, the lands are generally allowed to lie [illegible] allowed to dispose of them: these passed principally into the hands of private individuals. Hence it happens, that by far the greater number of the few large landed proprietors existing in Greece are to be found in Attica, Bœotia, Eubœa, Phthiotis, &c.

A law was published in 1836, respecting the Dotation of Hellenic families, by which each had a right to purchase 120 stremmata (30 acres) of national land by public auction, and a credit of 2,000 drachmas (72*l.*) was allowed each family by the State for this purpose, repayable in 36 years by an annual interest and sinking fund of 6 per cent. In the event of the purchase-money exceeding 2,000 drachmas, such surplus was to be repaid within 10 years.

This Ordinance was found, by experience, not to act satisfactorily. The price of national lands was run up at auction, by competition, far beyond their real value, principally in consequence of the long credit allowed by the Government. The payments were not regularly and punctually made, and arrears accumulated to such an extent that finally, in 1855, the Government was obliged to pass an act cancelling all obligations for over-due interest, &c., and retaining only the original value of the land.

Several propositions have since then been made, and various attempts tried to obtain a satisfactory solution of this very difficult question. But hitherto in vain.

The following is an approximative return of the number of oxen employed for tillage in 1865 (since when they have probably not materially increased), namely, in

	Oxen.		Acres.
Attica and Bœotia	13,147 or 1 oxen for every		84
Eubœa	13,529	,,	60
Phthiotis and Phocis	17,552	,,	48
Acarnania and Ætolia	20,287	,,	60
Achaïa and Elis	20,184	,,	48
Arcadia	21,624	,,	40
Laconia	18,488	,,	37
Messenia	17,123	,,	33
Argolis and Corinth	13,603	,,	68
Cyclades	13,390	,,	49
Total	168,927		

As a general rule, very few cattle or sheep are bred either by small or large landed proprietors. This is done by shepherds or graziers, a district nomad race, who raise oxen and sheep for the consumption of the entire country, the largest number of which are bred in Northern Continental Greece.

These cattle are pastured on the lowlands in the winter, and in the mountain districts in summer. Very little is paid for such pastures as are national property, but on private lands in the neighbourhood of towns special agreements have to be entered into.

No pains are taken in improving the breed, and in consequence, the oxen and sheep are very undersized, more particularly the former; the average weight of a Greek ox being only 60 okes, or 169 lbs.

The following is the official Return of the number of cattle paying tax in 1865, namely:—

Sheep	1,778,729	Horses	69,787
Goats	2,289,123	Mules	29,637
Oxen	5,205	Asses	64,051
Buffaloes	711	Swine	55,776
Cows	51,994	Camels or dromedaries	72

Cattle exempt from taxation are not included in the above statement, viz.: Oxen employed in the cultivation of the soil, sheep and pigs belonging to agriculturists and peasants—foals of horses, asses and camels, and calves up to two years old.

It appears that about one-half of the entire extent of Greece Proper may be considered capable of tillage, and the other as adapted for pasturage.

8. Very little agricultural machinery has been hitherto introduced into Greece, with the exception of the winnowing machines employed in cleaning currants in the Peloponnesus; machinery as a substitute for and aid of manual labour in agriculture may be said to be almost unknown, and it is too probable will long continue to be so, for a variety of causes, namely, want of sufficient capital, practical knowledge of the kind of machinery required, and the difficulty of transports without roads.

An attempt was made by Prince Jean Soutzos to introduce steam-ploughs and other agricultural machines on his farm in the Peloponnesus, but the result did not realize the expectations entertained in their favour. Engineers to work and repair the machinery had to be procured, at a great expense, from abroad. The machines themselves proved [illegible] adapted to the soils [illegible] required to perform. The

2. The law makes no distinction between the divisions of property in Greece on the death of the owner.

Should a landed proprietor die intestate, his estate is divided between his sons and unmarried daughters in equal portions, share and share alike. If the widow was poor and brought her husband no dowry, then she is entitled to an equal share with the children. If she had a dowry, as is generally the case, her claim on her deceased husband's estate takes precedence of all other creditors.

The married daughters have a right to participate in the division of the paternal property, on giving up their dowries; but this is a privilege rarely availed of, the marriage portions given to daughters generally greatly exceeding the legal share of their parents' property. Families are not unfrequently impoverished by the large dowries bestowed on the daughters, which is submitted to by the sons without complaint. It is extremely rare for the sons to marry in Greece till their sisters are provided for; and this feeling pervades all classes.

In the event of a married man making a will, should he have four, or less number of children, he can dispose absolutely of two-thirds of his real and personal property as he wishes; the remaining one-third must be equally divided amongst his children. If the family consist of more than four children, one-half of his estate must be divided amongst them, and the other can be left as he sees fit.

Ionian Islands to the mainland, who assist in getting in the crops, and return again to their homes when the harvest is over, be considered so. These latter are generally paid in produce, usually receiving one-tenth.

10. Few proprietors live on their estates, in detached dwellings, in Greece, excepting in the islands. Those near large towns reside in them, and in the country districts they congregate together in villages for mutual protection.

11. The houses of the smaller peasant proprietors in the rural districts of Continental Greece are mostly built of rough stones loosely cemented with mud or clay, instead of mortar. These kind of dwellings are rarely more than one story high. The floors are of earth beaten to a hard consistency. There are no regular fire-places or chimneys, and when necessary, a fire is lighted on a rude hearth in a corner of the apartment, and the smoke is allowed to escape as it best can, either through the open door and windows, or a hole made by removing a tile from the roof. There is generally a raised wooden platform, or kind of low loft, in the interior of the house for sleeping on, on which are arranged the bedding and a gayly painted wooden chest or two for keeping clothes in. The ovens are detached buildings, and in fine weather the little cooking that is required is done in the open air.

In most of the country districts the windows are merely closed by wooden shutters, and glass is an unknown luxury. Habit and the general fineness of the climate, however, in a great measure compensate for these hardships.

The agricultural population of Greece live extremely frugally, particularly in the villages; their food consists principally of coarse brown bread, called "keramedopita" (tile cakes), made of a mixture of barley and corn-flour, or "bobota" (bread made of maize); in addition to which, cheese, salt-fish, olives, grapes, melons, and other fruits when in season, form almost exclusively their nourishment. They rarely eat meat more than ten or twelve times a year—on feast days; but drink a good deal of common home-made country wine, in which resin is dissolved in order to make it keep better.

Notwithstanding this coarse fare the men are strong, robust, sober, and capable of enduring hard labour without fatigue.

They are well clad for the climate, in strong white cotton cloth in summer (usually of home manufacture), and a kind of thick white woollen felt in winter. In addition to which the men wear large shaggy capotes in cold weather, when going or returning from their labour, which frequently serve them for beds also.

The women from early marriage and exposure to field labour are generally coarse and hard featured, but look better in their national costumes in the villages than when clad in thin, gaudily coloured, cheap Manchester cotton gowns, as is frequently now the case near the larger towns.

12. According to the census of 1861, the agricultural population of Greece (not including the Ionian Islands) is divided as follows, namely:—

	Families.		Families.
Attica and Bœotia	10,525	Laconia	17,426
Eubœa	9,723	Messenia	19,585
Phthiotis and Phocis	14,180	Argolis and Corinth	12,143
Acarnania and Ætolia	15,953	Cyclades	12,102
Achaia and Elis	19,555		
Arcadia	16,288	Total	147,507

Calculating each family to consist of four members, the total agricultural population of Greece is 590,028 souls.

The land is generally divided into three portions, one of which is allowed to lie fallow every alternate year, and are then sown with wheat, time after time, no rotation of crops being observed; this is particularly the case in the Plain of Marathon, where, however, the soil is much better than near Athens.

The mode of cultivation is primitive in the extreme. Oxen are generally used in tilling the land, though instances occur of the use of horses in isolated districts. The plough usually still employed is of the same simple construction as in the days of Hesiod, and is too light for any but the poorest soils (often not weighing more than the yoke), the ploughshare merely scratching the earth. There are not wanting, however, practical agriculturists who defend this system of cultivation, and maintain that, if the soil was turned over to a greater depth the result would be less favourable to the farmer from the quantity of nitre contained in the ground.

In some parts of Western Greece, a method, however, exists of preparing the land for wheat, barley, flax, &c., with a sort of hoe as in Sicily, without ploughing, and the produce is said to be more plentiful than when the ordinary course is pursued.

The cattle of small proprietors are pastured on the fallow lands, road-sides and by-paths near the villages. Few peasant proprietors ever lay in a winter stock for their animals.

(B.)—Tenants and Sub-Tenants under Landlords.

Tenure.

1. In Continental Greece the usual quantity of land held by tenants consists of 15 to 50 acres, according to the district and nature of the produce, and is generally farmed by the year.

2. The method in which most of the larger proprietors cultivate their estates is what is called on the metayer system by colleagers, as is done on the Turkish Tzifliks; the landlord furnishing the land and housing the colleagers, or peasants, who till the soil with their own oxen, and bear all other expenses; the proprietor receiving his rent in kind on the threshing-floor. On poor lands this is 15 per cent. of the net produce, after deducting the seed and the payment of all expenses, taxes, &c.

Should one-third of the seed be provided by the landlord in that case he receives one-third of the produce. The conditions, however, vary very considerably according to the quality of the land and nature of crops, &c.

The State permits the cultivation of national lands on the principle of receiving 15 per cent. of the gross produce, in addition to dimes and other taxes (amounting now to about 9 per cent.), all which must, at present, be paid in cash, at the market value of the grain, which latter is determined by assessors.

Sub-tenancies are extremely rare. Should no stipulation to the contrary be inserted in a written contract, the tenant has a legal right to transfer his lease to third parties, and the landlord is obliged to consent to such assignment.

3. By written agreement before public notary, and rarely by parol only, which, in the event of dispute, would have to be proved by witnesses. When there is no agreement the law appoints estimators, and the duration of the lease would be decided according to the nature of the engagement, crop, &c.

4. Written agreements are drawn up before the notary, who retains the original document, giving copies of the same to the parties interested.

5. None whatever—a contract is, however, considered to be renewed for its original term, if the tenant does not leave, nor the proprietor give him notice to quit on the expiration of the lease.

6. If no clause exists in the agreement to the contrary, a tenant may transfer his rights to a third party, by notarial contract.

Rent.

This is rarely paid in money (excepting by cultivators of the national lands) but generally by a share of the produce.

2. The rent is regulated by private agreement between the parties. In the event of disagreement, recourse must be had to the tribunals, which appoint estimators. When the rent is paid by a share of the produce, it is done so yearly, after the harvest has been gathered. What is implied by "a hanging gale" is quite unknown in this country.

3. The landlord has an unlimited power of raising the rent and of eviction in case of ill-adapted to the soil and nature of the work they [illegible] transport of them was difficult and costly, for want of proper roads, and their use has been partly abandoned.

Even threshing-machines are unknown in Attica, and the corn in the neighbourhood of Athens is still trodden out by horses as it was in the most primitive times.

Hired agricultural labourers are much employed in the vicinity of the large towns. Their wages vary according to the season of the year and the district. Male labourers are usually paid from 2*s*. to 3*s*. per diem, besides a quart of wine of the value of about 3*d*. Female labour is also largely made use of in agriculture. The women are generally paid about half what is given to the men, but without wine. In the rural districts they hoe the vineyards, aid their husbands in gathering in the crops of all kinds, and do nearly the same description of field labour as the men. Near the towns they assist in the cultivation of the vine, gathering the vintage, collecting olives, and the lighter kind of field work.

Labourers living with proprietors on estates are remunerated by special agreements. They are generally the epistates or overseers, and receive about the same wages as other day-labourers, with the exception of being boarded and lodged.

9. The emigration of agricultural labourers is merely from district to district, according to the demand for them, but not to foreign parts, unless the passage of labourers from the

Improvements.

1. They are executed (especially building) almost invariably by the landlords.

2. Under written agreement drawn up by public notary, in most cases.

3. If the improvements in an estate are merely what may be termed natural ones, that is, arising from the ordinary course of cultivation, the landlord would be entitled to them.

But not, if they were of an extraordinary nature; for instance, if arable lands had been converted into vineyards and fruit trees, planted, where there were none before, the tenant could demand an indemnity, and the tribunals would recognize his claims. If the improvements were, however, merely ornamental and made solely for the tenant's own gratification, he would not be entitled for compensation.

A tenant can, however, remove the materials of buildings erected by him, on giving up the lease, and the proprietor refusing to indemnity him for them.

4. In case the parties cannot agree between themselves, the tribunal appoints estimators, who ascertain the real value of such improvements; and on the tenant obtaining a sentence in his favour, it is enforced by the law officers.

5. As before mentioned, no Agrarian Banks exist in Greece (see answer to query (A) Small Proprietors, No. 4).

Miscellaneous.

1. The relations between landlord and tenant are generally friendly.

2. The mode of cultivation by the tenants (colleagers) differs but little from that of the small proprietors. Their standard of living, solvency, independence, and general circumstances are nearly the same.

3. In the absence of statistical returns, the annual rate of increase in the population among tenants, as compared with that of small proprietors, may be assumed to be identical.

4. No emigration takes place.

5. The system of cultivation by colleagers has this great disadvantage, that neither the proprietor nor tenant feel much interested in improvements.

6. The Government leaves the proprietors perfectly at liberty to make any arrangement they think proper with their tenants.

7. *There is no such limitation of proprietary rights.*

8. None.

9. The system of allowing peasants to cultivate national lands, on the principle of the Government receiving 15 per cent. of the produce, tends to increase the number of landowners. It is said that a law regulating the disposal of national lands is under consideration, but there is little prospect of any real change being effected at present.

10. There is no assistance given tenants by law or public credit to become proprietors, but there is no doubt that the desire to do so is general, and, owing to the large quantity of waste land, there is but little difficulty in effecting this.

11. The laws at present in force regarding national lands, and the division of landed property tend to the dispersion of it.

ing men, women, and children) is, therefore, only about one for every 20 acres.

In the absence of any statistical Table, separating the increase of the rural population from that of the urban, it may be surmised that there is no great difference between them; the excess of births in the rural districts being quite counterbalanced by a corresponding increase of mortality, from the less care the parents are able to bestow on their offspring.

It is calculated that, at the present rate of increase, Greece requires seventy-seven years to double her population, and, in this respect, she ranks immediately after Spain, but before Italy, the Netherlands, Bavaria and France.

13. The principal complaints of the landed proprietors are, that of being too heavily taxed and the dimes being levied in an oppressive manner, in return for the payment of which they say they derive little or no benefit from the Government, either by the construction of roads to facilitate the transport of produce, or by proper measures being taken for the maintenance of public security and the suppression of brigandage.

To show how greatly the want of roads retards the progress of agriculture in Greece, it may be mentioned that the present cost of the transport of an oke of corn from Livadia, a distance of 60 miles, is 12 lepta, equal to 15*s*. per imperial quarter, and the expense is less to bring cereals from the Black Sea, than from the plains of Marathon, which is only 25 miles from Athens by land.

Inclosure 4 in No. 4.

Report by Consul Ongley respecting the Tenure of Land in Greece.

A STATISTICAL Report on Greece, published in 1867, gives its area and population in 1861 as follows:—

	Acres.	Population.
The Morea	5,567,741	530,590
Continental Greece	5,179,870	287,333
The Islands and Eubœa	976,000	249,093
	11,723,611	1,067,016

Of the inhabitants there were:—

Of the Greek Church	1,086,900
Roman Catholics	9,358
Other religions	522

Of these:—

147,507 families were of the agricultural labouring class.
16,122 ditto landholders.
38,953 ditto shepherds.
32,801 ditto artisans and workmen.
19,592 ditto labourers.

Since then the increase in population has been rather less than one per cent. per annum.

The following division of the land in 1861 differs slightly in quantity from that mentioned above:—

	Acres.
Cultivated lands	1,918,941
Waste lands, capable of cultivation	3,031,741
Mountains and natural pasture lands	4,799,796
Woods and forests	1,398,621
Marshes and lakes	215,083
Cities, towns, roads, and rivers	426,580
	11,790,762

Since then a further quantity of land has been brought under cultivation. The writer has no means of obtaining an exact account of it.

The 38,593 shepherds and their families mentioned above are employed on the natural pasture and waste lands tending the flocks, therefore the agricultural class (147,505 families) would remain to cultivate 1,918,941 acres of cultivated land, and as the women work almost as much as the men, there would be, taking three able-bodied labourers, male or female, to each family, 442,521 labourers for 1,918,941 acres, or one labourer to $4\frac{1}{3}$ of an acre.

The proportion of landholders to the agricultural labouring class is 16 to 147, according to the above statement, but as the small proprietor who works his own land was, in taking the census, called a γεω[illegible]or), and not a κτηματιας (landowner), it follows that no approximate calculat[illegible] made as to the proportion of the agricultural labourers to the landed proprietors.

The woods and forests of Greece belong, as a general rule, to the State, with the exception only of those few which belonged to private individuals before the Revolution, in virtue of written documents given by the Turkish authorities.

These woods and forests, both private and public property, are under the superintendence of two Inspectors, having under their orders 195 employés. The whole expense to the Government is 109,912 drachmas (3,925*l.*) per annum, whilst the revenue derived therefrom in 1866 amounted to 375,000 drachmas (13,393*l.*)

Industries.—The principal are the following:—

Silk-winding establishments, of which there are six. The one at Athens is the largest, and has 236 basins and employs 300 hands, of which 260 are girls.

At Chimi, Calamata, and Hydra, silk stuffs are manufactured, but for want of capital not in large quantities.

Cotton Spinning-Mills.—Of these there are six, and the profits of late have been so great that it is intended to establish others; the numbers of the twist are from four to fourteen.

Woollen Manufactures are carried on at home by women.

Tanneries.—There are nine, of which five are Syra, two of them employ 200 men each, the greatest part of the leather exported is sent to Turkey.

Dyers.—Although Greece has plenty of dyeing materials, yet for want of textile fabrics, this branch of industry is very confined.

Skull Caps and Calemkiars (handkerchiefs for the head-dress of women).—Of these there is a considerable manufacture, and the former are superior even to those of Tunis, as well for the goodness of the colour as for the quality.

Soap-boiling Manufactories.—Some have been established at the Piræus, Syra, and Patras, and although they are not large, they have greatly diminished the quantity of soap annually imported.

Pottery and Brick-making.—This has increased of late, and for some years pottery has been exported to Turkey.

Flour Mills.—Within the last few years machinery has been imported into Greece, and mills have been erected at Athens, the Piræus, and Syra.

The other industries are so trifling as to be hardly worth mentioning.

Land Occupation.

When Greece obtained its Independence in 1829, the lands of the Turks became, with few exceptions, the property of the Greek Government; it also took the lands of those monasteries which were in ruins, or had only six monks remaining, so that it obtained possession of about three-forths of the whole of the country: part of these lands were given away in small lots of the value of about 70*l.* sterling to some of those who had fought during the Revolution. The law directed that lands should be given to all the heads of families, but it appears not to have been faithfully carried out, part were sold, payable by instalments extending over ten years, part are still cultivated by the peasants who pay from 12 to 15 per cent. of the produce to the Government, exclusive of the regular tithes, and consider the land they occupy as their own property, and pa t still belongs to the Government.

The land is held therefore principally by the Government and small proprietors probably more than one-half of the agricultural population are small proprietors.

Tenants under proprietors are not numerous, and sub-tenants can hardly be considered as existing.

(A.)—Small Proprietors.

1. *Of currant-lands they hold in general* from 2½ to 15 acres, and of arable land from 12 to 75 acres, very few persons have as much as 250 acres. In some mountainous districts, and in the islands of the Archipelago, there are landowners having as little as half an acre. The land is often intersected by other properties.

2. On the death of the owner the land is divided equally between the sons and unmarried daughters, and if a married daughter give back her dowry she then shares with the rest, and if the wife have no dowry, and is poor, she takes a share equal to that of one of the children, but in no case exceeding one-third of the real and personal estate.

3. The sale, transfer, exchange, or division of property must be made by an act drawn up by a notary, which is then registered at the Registry of Mortgages. The notary's charge is 2½ drachmas per 1,000, and that for registry is 2 drachmas (1*s.* 5½*d.*) for the first sheet, and 1 drachma (8⅝*d.*) for each subsequent sheet. In the case of the division of property amongst relations the conditions may be drawn up on stamped paper of the value of 10 drachmas (7*s.* 3*d.*) instead of paying 2½ drachmas per 1,000. Of the notary's fees one-half goes to himself and one-half to the Government. There are no other charges whatsoever on the sale or transfer of property.

4. The Greek National Bank, which has branches in many of the principal towns, is obliged, by its Charter, to employ 2,000,000 drachmas (71,428*l.*) of its capital in granting loans to the agricultural class on landed property, or on bills having three signatures, the said obligation to cease when an agricultural bank is established. The Ionian Bank has a branch at Patras, and also grants occasionally loans on property at 8 to 10 per cent. per annum, but the former establishment has the privilege of imprisoning a debtor, or of sequestrating and selling his property without the legal formalities which the latter is obliged to observe; so that the Greek Bank could sell the property of a debtor within a few weeks, whilst any other creditor might legally be delayed many months by a litigious debtor. These loans are raised generally either to pay part of the purchase-money of the lands or to improve and cultivate it.

5. The property, if owned by persons in the towns, is frequently heavily mortgaged, but that owned by peasants is rarely so: the usual rate of interest is from 7 to 10 per

cent. from the banks above-mentioned, but private individuals obtain more; the legal rate of interest is 12 per cent. per annum.

6. A written application in duplicate is made to the Registry Office. One copy is afterwards returned to the applicant. The charge for registry is 1 drachma per 1,000 drachmas, and one ½ drachma for every other 500 drachmas till it reaches 5,000 drachmas, above which sum no extra price is charged. Of the notarial acts and registry above-mentioned the cost is paid by the party most interested: for example, if it be a loan, the borrower pays all, if it be a sale or a lease each party pays half.

7. The crops consist of cereals, cotton, tobacco, onions, sesame, potatoes, linseed, beans, olives, currants, grapes, almonds, palonea, &c. In general only one article is sown in a year, and as there is more land than the hands can cultivate, the field is left fallow the next year, so that no system of rotation of crops is followed. In Livadia, Argos, and Tripolitza the European system is in some degree followed, but in other parts of Greece the system of agriculture is most ancient and rude.

The plough is of the oldest description, and merely scratches the surface of the earth; little manure is employed.

Stock is raised on pasture-lands which are entirely separated from the arable land, and belong mostly to the nation, but sometimes to the municipality, the owner of the stock paying a certain annual sum for the right of pasture.

In the winter the stock remains in the lowlands, and in summer moves up into the mountains, when moving they are allowed to graze on the way without charge, provided they do not stop more than twenty-four hours in one place; no attempt is made to improve the breed.

8. Winnowing machines for currants are in general use, but other machinery is made use of only on one or two farms.

Many hired labourers are employed, and they move about from one district to another to get in the harvest to cultivate the vine, &c.

These labourers are very frequently small proprietors themselves, and go out to work when they have none to do on their own property; the crops on the highlands being gathered later than those on the lowlands, facilitates this.

Many come from the Ionian Islands. and return to their homes when work is scarce. Women and children are largely employed; they sow, they hoe, but do not reap. In the vineyards they carry away the cutting of the vine, take manure to the plants, collect the stones in the vineyards when necessary, break off the tops of the shoots and the leaves to give the fruit more sun, collect it, and in some few places they also dig the vineyards.

Wages are, for males, 1 drachma 60 leptas (1*s.* ½*d.*) to 3 drachmas (2*s.* 1½*d.*) per day, and one quart of wine.

For females 80 leptas (7*d.*) to 2 drachmas (1*s.* 5*d.*) without wine.

The following was the average rate of wages from 1849 to 1858.

	Per Day.		Per Day.
	Drachmas.*		Drachmas.
1849	1·75	1854	2·20
1850	1·76	1855	2·64
1851	1·87	1856	2·90
1852	1·99	1857	3·04
1853	2·05	1858	3·04

* One drachma equal to 8⅝*d.*

During the gathering of cotton, wages have been as high as 5 drachmas (3*s.* 6½*d.*) per day, in places where this plant is grown. In some districts, a few labourers live with those who employ them. At the harvest, the employer feeds the labourers, and then pays about one-fourth less than the above sums as wages.

9. None of them emigrate.

10. The small proprietors live in the towns or villages near their property.

11. They live in the islands in small houses built of stone; in other districts, some of stone, and some of mud bricks dried in the sun, having only one room with a floor of earth; sometimes those better off have also a room above floored with planks; they have their oven, stable, and outhouse for food for horses, &c.

They have bread made of Indian corn or barley, and sometimes of wheat; also cheese, milk, olives, oil, onions, garlic, cabbage, a sort of macaroni, salt-fish, but rarely meat. They drink ordinary wine, costing about 3*d.* to 5*d.* per quart.

The dress of the men consists of a cotton shirt, home-made woollen trousers, jacket, and woollen socks, gaiters, shoes, and sometimes sandals, with a straw hat or red cap on the head.

The fustanelle or kilt is also worn, but is set aside when at work. The ordinary dress of the women consists of cotton under-clothes, a cotton print gown, a long woollen coat, and a cotton handkerchief on the head. On holy-days they dress better. The are very frugal; many of them are in tolerably easy circumstances, according to their own ideas of comfort.

12. There is no means of ascertaining the average population of small proprietors per acre; they are constantly increasing owing to the division of property amongst the children on the death of their parents.

13. There does not appear to be any public opinion on the subject.

The Greeks, as a rule, do not take any interest in agricultural affairs.

Complaints are frequently made about the acts of the Greek Bank. It is considered that they do not give sufficient facilities to those who ask for loans and do not show forbearance to their debtors.

(B.)—Tenants and Sub-Tenants under Landlords.

1. Tenants hold generally from 12 to 75 acres.

2. Tenants under landlords are not numerous; the land is let generally for only one or two years. A tenant cannot sublet without the express permission of the landlord. In a few places landholders have given lands in perpetuity, receiving a fixed amount of produce in kind as yearly rent. This has been done by written contract, and in this case the tenant can sub-let or sell his interest in the holding, subject to the conditions of his contract.

3. The tenancy may be created by a private written agreement on stamped paper; but if one of the parties cannot write it must then be drawn up before a notary, otherwise the Courts will not consider the contract as a legal document, but simply as corroboratory evidence. In case of no written agreement and no witness the Court would administer an oath to one of the parties, in case of dispute as to the conditions of the lease.

No man would cultivate the property of another without an agreement of some sort; if he did so, the Court would probably order him to be paid as a simple daily labourer.

The notarial charge for drawing up a lease is $2\frac{1}{2}$ drachmas per 1,000 drachmas for each year of the lease; so that if the rent were 100*l.* per annum, and the term of the lease ten years, the charge would be 2*l.* 10*s.*, of which one-half would be paid to the Government and one-half be kept by the notary. If the lease were for the whole life, the charge would be 2 per cent.

4. A written agreement remains with the notary, the *parties taking only a certified copy; but if the parties wish to register it,* they can do so at the Registry of Mortgages.

5. Those persons who have obtained lands in perpetuity, subject to the payment of an annual rent, as well as those who hold Government land, for which they pay annually a certain amount of produce, consider they have a right to remain in occupation of their holding so long as they punctually pay the stipulated annual payment.

6. In the case of those holding lands in perpetuity, subject to an annual rent, the holders consider themselves as having the right to sell their interest in the land, with or without the consent of the landlord, upon condition that the purchaser is to pay to the landlord the same annual payment as had hitherto been paid by the seller.

Those who hold national lands consider that they have the same right; but the Government seems to be of a different opinion, for a project was brought forward a short time ago to compel the occupants of these lands to pay one-half the present value of what they had cleared and planted with vines, olive-trees, &c.; nothing was said about arable land. It is evident, therefore, that the Government considered itself entitled to act with regard to these lands in any way it chose.

Rent.

1. In case of tenancies the conditions vary with the province and with the quality of the land, which is divided into plain and upland; the rent is calculated either on the net or the gross produce, or is a fixed sum in money or produce; but in each of these cases the whole is never less than 10 per cent., nor more than 50 per cent. of the gross produce.

The seed is generally provided by the farmer, the Government dues are deducted previous to the division of the produce, or each pays one-half the dues, the gross produce being divided equally between the landholder and the farmer. In Attica the rent is usually paid in money: but if in kind then it is one-half the produce after deducting the Government dues. In Phthiotis, Phocis, and Eubœa, a quantity of produce equal to the seed is given as rent, the landholder giving nothing but the land.

In Acarnania and Ætolia one-half of the net produce or one-fifth of the gross, and sometimes a fixed amount.

In Argolis, a rent in money at 20 to 40 drachmas (14*s.* 3*d.* to 28*s.* 6*d.*) per acre is preferred.

In the Cyclades, half of the produce, after deduction of the Government tythe, which is now 8 per cent.

In Laconia, one-third of the gross produce, and in Messina, from 10 to 30 per cent. of the net produce.

2. The rent is regulated by competition, but of course the custom of the district would be the basis of the contract. In the case of Government lands cultivated by peasants, it is regulated by law, and is 15 per cent. of the gross produce in the case of tillage-lands; double tythe in the case of currant-lands, payable in kind.

The rent, if in money, is paid half-yearly; if in kind, when the crop is gathered.

3. The landlord has an unlimited power of raising the rent and of eviction in case of non-payment.

4. The landlord can sequestrate the produce if the payment be in kind, but if it be a money payment he is then only a simple creditor, and has no privilege over other creditors.

Evictions.

1. The landlord who wishes to evict a tenant applies to the Court, and if the tenant cannot bring forward some plausible excuse, it sends a bailiff and evicts him, if there be no written contract; but if there be a written agreement a litigious tenant would always find some legal pretext for remaining in possession months, and perhaps almost a year, for the action of the Courts of Law in Greece is very, very slow, but, on the other hand, legal charges are very moderate.

2. Evictions are not frequent, tenants are not numerous, and therefore they may be considered as being masters of the situation.

In the case of peasants occupying national lands, they would not be evicted, but the Government would attack them as simple debtors to the State.

Improvements.

1. They are executed by the landlord.

2. If they were executed by the tenant they would be provided for by written contract.

3. The landlord would have a legal right to any improvement unless otherwise provided for by written agreement; but in the case of any building erected by the tenant on the land, the latter would have the right to remove it and sell the materials.

4. This question is already partly answered above; in case of any dispute between landlord and tenant the Court would adjudicate thereon.

5. No tenant would attempt it—in any case the property could offer no security to the lender.

Miscellaneous.

1. The relations between landlord and tenant are friendly, no legislative interference appears to be required by the tenant for his better protection.

2. The mode of cultivation is the same as that by the small proprietors; as to solvency and independence, they are not in general well off in a pecuniary point of view, and therefore much cannot be said as to their solvency. Universal suffrage gives them a certain independence, but they will willingly give their vote for a pecuniary consideration—their position must be considered as rather inferior to that of the small proprietor.

3. It is difficult to state the annual increase in the tenant population as compared with that of small proprietors. The latter increase, but the former, except, perhaps, in the immediate neighbourhood of Patras, cannot be considered as augmenting.

4. Neither tenants nor their children emigrate.

5. As already said, the Greeks pay little attention to these subjects.

6. The creation of freeholds or tenancies by proprietors, or the granting of leases has not been enforced by legislature.

7. The answer to this is included in No. 6.

8. This is also answered by the preceding.

9. No step has been taken by Government beyond its being ready to sell land when a purchaser presents himself.

10. Tenants do desire to become land proprietors, and when they can get together a little money they do purchase. Capitalists have no inducement to purchase lands, and

those who have large properties have every inducement to sell them. When a man cannot go to his estate except at the risk of being carried off by brigands, he of course prefers selling when he can find a purchaser.

11. The law by which property is divided equally amongst the children of course tends to favour the dispersion of land.

Copyhold.

The tenure by which many occupy national lands without having purchased them, or having received them as a free gift from the nation, has already been explained. These bear some resemblance to the copyholds of England, and the longer the Greek Government is in coming to a final decision respecting them the stronger will be the resemblance.

Patras, October 18, 1869.

Inclosure 5 in No. 4.

Extract from a Work on Agriculture in Greece, by M. Apostolopulo.

IN Greece whatever is not laborious and is not considered mean or ignoble, but is lucrative, we all pursue. In Greece agriculture, carried on by the most numerous and lowest class of men, is considered to be one of the meanest occupations, and, therefore, it is abandoned not only by large proprietors and rich Hellenes, but it is hated also by the very sons of the peasants, who have sent them to study. The peasant's son, who has had the advantage of improving himself by study, instead of continuing to do so also as regards agriculture so as to be able to improve his own property, has despised it and has become an educated man and, we see almost all learned men, but no educated agriculturist.

In Greece the Hellene wishes always to imitate his betters, and those [illegible] who gain most; for this reason, we see crowds of learned men who gain [illegible] barely the actual necessaries of life; crowds of employés constantly being dismissed and loitering about; crowds of merchants, small tradesmen, money-lenders, and usurers, and not a single educated and finished agriculturist capable of improving Greek agriculture. In Greece all who come out of the high and low schools, all employ themselves with politics and loiter about to learn the news; not one condescends to hold the plough or to improve scientifically his property, because he considers this is the work of the ignoble peasant or labourer. We all know that the agricultural population in Greece is more numerous and worse off than all the other classes. The Greek peasant has nothing else for his work by which he is to maintain a whole family, than his oxen and one, or at the most, two beasts of burden (we mean the greater part) to carry his agricultural implements and gather in his crops. Let us see now to how many accidents and difficulties he is exposed, and whether in the end he can overcome them without selling even his property; his own lands, from which he and his children expect the first necessary of life, which we call bread.

The first and not unfrequent misfortune to the peasant is the death of one or many of his animals, and immediately, from inevitable necessity, he requires money to replace them.

On account of the non-existence of agricultural banks he goes to the money-lender, who is an inflexible usurer, from whom he gets money at 20 to 50 per cent. on a mortgage of his property, which, after a short time, is put up to auction. This is ruination for him—this is his destruction. This is the reason which forces him to hope nothing from agriculture, to hate it and to neglect it.

Inclosure 6 in No. 4.

Mr. Finlay to Mr. Erskine.

My dear Mr. Erskine, *Athens, October* 30, 1869.

I HAVE read the circular and questions concerning the laws and customs that regulate the tenure of land with much interest, from their giving me a view of queries that civilized society finds it necessary to ask. I do not think that I could answer any of the questions very satisfactorily, but yet I wish to say something about the state of agriculture in Greece. You will obtain direct and authoritative replies from Greek lawyers to all the legal questions, for the laws of Greece on the subject are simple. The legal rights relating

to land are founded on the Roman law which regulates rights of possession and property. The customs which modify the rights of possession and cultivation in accordance with the exigencies of the times, as communities are growing or decaying, are few, and exist chiefly on national lands and in some of the islands of the Archipelago.

I think I shall be best able to supply you with information by stating the result of my own observations on the system of cultivating the land which makes property in land so little desired in Greece by any but peasants. The mode of cultivation pursued by small proprietors, who form the majority of the agricultural population, by the cultivators of national land, who are a considerable body, and by small farmers who till the few large private estates, is precisely the same. The cultivation of cereals occupies more than half the productive industry of the country, and in no other region in Europe is so much labour, capital (though only in rude ploughs and oxen), and land employed in producing so small an amount of wealth. The general size of the small properties and the holdings of the cultivators of national land and private estates is a "zevgari" (from ζεῦγος, a yoke or team), an extent analogous to what was formerly called in Scotland a ploughgate, and which is the land that can be cultivated by the head of a family, who ought to have two pair of oxen to work it properly. It is the almost universal rule that each small proprietor possesses a zevgari, and that each cultivator of national land occupies no more. The mode of cultivating a zevgari is this. The land is ploughed and sown as seems good to the cultivator. But when the crop is ripening, his power over his produce becomes subordinate to that of the agents of Government, who, in virtue of the right to a tenth of the crop, exercise an absolute control over all the agricultural operations of the cultivator. It is said, and if it be true, it proves the existence of a considerable amount of dishonesty and skill in roguery in the agricultural population, that the extraordinary powers conferred on the Government and its agents are necessary in order to prevent the diminution of the land revenue by the frauds of proprietors and cultivators. As it is, proprietors and cultivators must obtain permission from the representative of the Government tenth before they can put a sickle to their crops, and they must then carry their grain to the traditional thresh[illegible]-floors of the village or of the zevgari where custom requires in the interest of Government that the tenth should be measured out. Another permission is required to commence treading out the grain, for in Greece this rude system is still practised, and the proprietor of nine-tenths of the crop cannot carry his property from the threshing-floor to his barn until the farmer of the tenths or the Government agent finds it convenient to have his share measured out.

These arrangements give the command of the grain-market at the season when the price is generally highest to the farmer or agent of the Government tenth. This is the great evil that depresses agriculture in Greece and renders everything relating to the property and cultivation of land dissimilar from what prevails in Great Britain, Ireland, and the British Colonies. As a general rule the small proprietor and cultivator in Greece cannot secure to himself increased profit by additional labour and skill. It is of no avail to raise an early crop of wheat, for the Government tenth will be brought into the market before his produce. The tax-collector has the power to be always first. Nor can the proprietor be sure of deriving more than the price of the average quality of the produce of his district, even if by increased labour and expense he raise produce of superior quality, for the collector of the Government share can always secure to the merchant or the miller the largest part of the supply required; and what may be purchased to complete a cargo or to fill a magazine will be mixed with other produce, and will only obtain a medium price. Experience shows that it is only in exceptional circumstances caused by vicinity to a considerable centre of consumption, or resulting from accidental facilities of transport that the merchant or the miller finds it possible to purchase small parcels of produce of superior quality from the producer. It is not, therefore, surprising that agriculture as far as relates to the cultivation of cereals, is in a stationary condition, that no wealthy Greek merchant purchases land, and that the small proprietors and cultivators when they want money are generally compelled to raise it for short terms and to pay from 2 to 3 per cent. a month. The present obstructive routine offers an insurmountable barrier to the investment of capital in the improvement of agriculture, and even prevents the small proprietor from acquiring habits of industry by rendering additional labour rarely profitable.

There is hardly any difference in the mode of living, cultivation, character, social condition, and system between the Greek and Albanian population of the Hellenic Kingdom engaged in agriculture, nor between the villages composed of small proprietors and those composed of cultivators of national land or private estates. It is natural that the number of small proprietors in comparatively easy circumstances is greater than the number of cultivators of land not their own, for the first pay only one-tenth of their produce and the

second under the most favourable circumstances two-tenths. The cultivators of national lands and private estates of course secure to themselves satisfactory returns for their labour by only cultivating land of superior quality, and leaving in pasture and long fallow, land which would be cultivated with profit by proprietor labour. In the present state of landed property and agriculture in Greece, which is certainly not a state of things that is desirable to perpetuate, there can be no doubt that an increase of the number of small proprietors each possessing a zevgari would augment the agricultural produce of the country. But a great addition to the number of small proprietors can only be made by giving them national lands, since they have neither capital nor credit to purchase them. And there may be a question whether there are not other methods of disposing of the national lands more likely to attract capital and labour to the soil. With the present rude system of cultivation, even if the number of small proprietors were greatly increased there would be no diminution of the obstacles that check the development of the agricultural resources and general welfare of the country.

The result of my experience as a landed proprietor, and for some years a farmer of my own land in Attica, is, that no landlord would drive from his property any cultivator who possessed even a single pair of oxen, and who desired to stay and work the land. There is always a difficulty in finding cultivators on private estates.

From what I have said it appears to me that the difference between the state of property and agriculture in Greece and in Ireland is so great that I doubt whether any practical application can be drawn from the comparison or contrast of things so dissimilar, unless it be that both stand greatly in need of improvement.

Excuse me for writing so very long a letter merely to say that I can give no satisfactory answer to the questions you were so kind as to allow me to read.

Yours, &c.
(Signed) GEORGE FINLAY.

No. 5.

Mr. Erskine to the Earl of Clarendon.—(Received November 27.)

My Lord, *Athens, November 17, 1869.*

I HAVE the honour to transmit to your Lordship herewith the Report on Land Tenure *in the Island of Cephalonia, which* has been addressed to me by Mr. Consul Sebright.

The whole of the Reports on this subject from Greece have now been forwarded to your Lordship.

I am, &c.
(Signed) E. M. ERSKINE.

Inclosure in No. 5.

Report by Consul Sir C. Sebright on the Tenure of Land in the Island of Cephalonia.

Name of Country.—Island of Cephalonia.
Population.—78,000.
Religion.—Orthodox Greek Church.
Industrial Pursuits.—Agriculture and Commerce.

LAND OCCUPATION.

1. By large proprietors, originally feudal, with investitures dating from a period anterior to the Venetian Dominion, or afterwards conferred by the Venetian Senate.
2. Middle-class proprietors, offshoots from the preceding, holding their estates under the law of entail.
3. Small proprietors originally created by the Venetian Senate.
4. Tenants holding lands in emphyteusis in perpetuity, or for limited periods.
5. Tenants holding by colonical tenure in perpetuity, or for a limited period.
6. Free tenants holding on leases of from two to six years, or only from year to year.

The last class is the least numerous. The other classes, as to their relative numbers, may be considered as standing in the inverse ratio of the order as above set down.

(A.)—SMALL PROPRIETORS.

1. From 5 to 25 acres seldom in a continuous body, but cut up into patches and intersected by other properties.

2. On the death of a proprietor his estate is divisible in equal portions among the males of the family, burdened, however, as the case may be, with dowries to daughters.

3. Property can only be transferred by deed drawn up by a notary, to be afterwards copied into a Register kept for the purpose in the Office of Hypothecs. The Notarial Act must be drawn up in the presence of witnesses, who are bound to affix their signatures, and on stamped paper of the value of 1½ drachmas per 1,000 of the estimated value of the property transferred.

4. The raising of loans on property is facilitated by the privilege accorded by law to the lender, by which such loans are constituted preferable claims on the estate to the exclusion of all others.

The transaction, however, must be evidenced by an authentic document to be registered in the Office of Hypothecs.

When loans are raised for the improvement of landed property, security is taken that the money will be expended for the alleged purpose; but such loans are rarely applied for.

The rate of interest varies from 5 to 10 per cent., according to the reputed solvency of the borrower.

5. Properties in general are heavily mortgaged. The common rate of interest is 6 per cent., when the capital is secured by special Hypothec, and not under 10 per cent. without Hypothec.

6. The creditor presents at the office of Hypothecs two identical notes, indicating the names of creditor and debtor, the description of the property to be hypothecated, and the amount of the loan. One of the notes in question is deposited in the Office of Hypothecs, the other is returned to the creditor with a certificate of inscription endorsed. The expense of this formality does not exceed 5 drachmas (3*s.* 7*d.*)

7. Currants, wine, oil, and grain. The richest soils are allotted to the vine and olive, the culture of which admits of no system of rotation.

Grain is raised on the poorer soils. After one year's crop the land remains for the next year in fallow. In the third year, should the first year's crop have consisted of barley or oats, it is sown with lentils, beans, or vetches.

The plough used is of the most primitive construction, drawn by two oxen, and making a furrow of about four inches in depth. Inequalities are smoothed over by means of the mattock, which the peasantry are accustomed to ply with great vigour and dexterity.

Sheep-goats and a few mountain ponies are the only animals reared; but no pains whatever are taken to improve the breeds.

During the summer the flocks are pastured on the high grounds, where there are but few cultivated spots that require watching. In autumn and winter they are pastured in the vineyards and among the low grounds, where they often cause incalculable damage, which gives rise to endless litigation and not unfrequently to bloodshed.

The surface cultivation of the Island may be estimated at one-third of its extent, the other two-thirds are available for pasturage. Grass lands there are none, in the accepted sense of that term.

8. No machinery of any kind is employed as a substitute for, or in aid of, manual field labour.

Hired labour is only employed by such of the large proprietors as cultivate portions of their property on their own account, the extent of which is comparatively insignificant. Ten hands will turn over with the mattock an acre of vineyard per day.

As every householder in the Island is an owner of property in one sense or another, the females of the family assist in the lighter labours of cultivation, but to no oppressive extent. Their peculiar task is to spin cotton, flax, and wool into thread, which they afterwards weave into cloth for family use on looms, the model of which, from its simplicity, may have been copied from that of Penelope.

It is only during the season of grape and olive gathering that they are to be seen in any numbers working for hire, and then principally in the vicinity of the towns, where they have their domicile.

The wages of agricultural labourers ranges from 1*s.* to 1*s.* 6*d.* and even 2*s.* per day, according as they receive rations, or not.

Women employed in olive and grape gathering earn from 6*d.* to 8*d.* per diem, in addition to their rations.

9. There is no distinct class of agricultural labourers as in England and most other countries of Europe.

As the soil of Cephalonia is naturally dry and the vineyards are situated mostly chiefly on the lower slopes of the mountains, the peasantry are enabled to finish their home cultivation early in the season and in time to enable them to proceed to the continent before the deeper soils of the Morea-Macedonia and the Danubian Provinces are sufficiently dry to be worked. Availing themselves of this circumstance they proceed to those countries in large numbers in quest of work, as many as 7,000 annually. They save up on an average about 20 Spanish dollars each, with which they return to their homes in the autumn in time for their own vintage. Cephaloniat emigrants, for longer periods, but equally mindful of their families in the Island, are to be found in large numbers all over the Levant.

10. The more considerable proprietors have houses both in town and in the country. The smaller and peasant landholders live in the villages nearest to their property.

11. Speaking in general terms, the landowners of all grades are lodged, fed, and clad in a style equal, if not superior, to that of their respective classes in any country of Europe. But since the cession of the Islands to Greece there is a considerable decline in the prices of local produce, which tells sensibly on the disposable means of all classes.

12. There are no reliable statistical data attainable from which this query could be answered in detail. It may, however, be assumed as a fact that the population of the Island is increasing in a ratio equal to that of the neighbouring countries of Austria and Italy.

The superficial extent of the island may be taken at 256·31 square miles, which would give a population of over 303 souls for each square mile.

13. The prevailing system of land tenure has contributed so signally to the prosperity of the island that few, I believe, would desire a change.

(B.)—Tenants and Sub-Tenants.

Tenure.

N.B.—As the prevailing modes of tenure in this island are the colonical and emphyteutic, the class of tenants, in the English sense, is the most limited of *all*; but, as far as they do exist, their holding is regulated by the same laws which apply to the two above-mentioned *classes to whom the observations* under this and the following head must be considered equally to apply.

1. From 2 to 10 acres each.

2. Colonical, or emphyteutic, generally, in perpetuity, but also for a limited number of years. The minimum course of the tenure in emphyteusis is fixed at twenty years, probably because the vine loses its productive vigour, and requires to be renewed after that period. As under both these kinds of tenure the tenant or holder is absolutely invested with the *dominium utile* of the lands, he is in all essentials a co-proprietor. Sub-tenancies are unknown. They are contrary to the disposition of law, a wise provision considering the limited extent of the holdings. In the case of the colonical tenure alone, the tenant possesses a legal right to assign part of his land in dowry to a daughter.

3. Tenancy must invariably be constituted by an agreement in the form of a notarial act, and authenticated by the signatures of two witnesses. Failing a regular contract, the right of possession ceases with the gathering in of the currant crop, and any dispute between occupant and landlord regarding rent would fall to be settled according to local use and wont. Instances of this nature are very rare indeed, and for obvious reasons.

4. There is a special register kept for this purpose in the Office of Hypothecs.

5. The annual canon in the case of lettings in emphyteusis, and the portion of produce payable to the landlord in the case of colonical, must appear on the face of the contract under the alternative of nullity. Failure to pay the stipulated rent for three consecutive years, subjects the tenant to the penalty of eviction. As free tenants invariably pay in kind, the landlord has always the means of securing his dues at the gathering in of the crop, of which the tenant is bound to give him timely notice.

6. Both by law and custom the tenant has a right to dispose of his interest in his holding; but only on due intimation of his intentions to his landlord, who by law enjoys the right of pre-emption. When the landlord assents to the transfer of the tenants'

rights to a new occupant, the outgoing and incoming tenants may be rendered responsible, conjunctly and severally, for the payment of the rent, as stipulated in the original compact.

Rent.

1. In the case of emphyteutic leases, the rent, according to the terms of agreement, may be made payable in money or in kind. In colonical and other leases, the rent is payable by share of the produce.

2. As has been already stated the law requires that the amount payable as rent must be clearly specified in the contract. It is settled by private bargain between the proprietor, or his land agent, and the tenant. But as regards the olive crop, the approximate quantity of oil which it may be expected to yield is estimated by a sworn valuator at the selection of the proprietor. Tenants holding by colonical tenure in perpetuity have the right to take exception to the first estimate, as they may see fit, and may call a second expert. These two experts, in case of disagreement, have the power to nominate a third to decide their differences, and whose decision is binding on all parties concerned. Other than colonical tenants have no right to call in a second valuator to decide between them and the proprietor, but they may throw the crop on the proprietor's hands by refusing to accept the proposed estimate of its amount. Rents in money are payable annually. Those in kind at the season of gathering in the crops of which, according to law, the landlord is to receive timely notice, so that he may be present in person, or by representative, to look after his own interests.

3. A landlord has no power of raising his rent, except on a renewal of the lease. Eviction for non-payment of rent, or breach of contract, can only be effected as the result of a judiciary sentence, and after the tenant has exhausted his means of defence. In the case of holdings in emphyteusis, the non-payment of rent for three years in succession involves eviction *de jure* and by summary process.

4. By common law the landlord has a claim on the produce of the holding for the payment of arrears of rent in preference to every other creditor of the tenant. This is the landlord's only resource, unless by an express clause in the contract it is stipulated that the non-payment of rent may be enforced by summary process and personal arrest. Failing such clause, he can only recover by the ordinary routine of summons and adjudication as established by the Code of Civil procedure.

Evictions.

1. The landlord raises an action before the Civil Tribunal by petition, wherein the legal grounds of procedure are to be set forth, with the relative proofs; a copy of this petition is then served on the defaulter by order of the Court, together with a summons to appear in Court within twelve days from the date thereof to answer the allegations contained in the petition. Failing to appear, sentence is pronounced in favour of the plaintiff within other twelve days from the day fixed for the hearing. Within a month, in the ordinary course of law, the case ought to be wound up and terminated. But where there is vexatious opposition on the side of the defendant by expedients well known to all practitioners before the Courts, the proceedings may be spun out to an indefinite length. The landlord's best protection lays in the saving clause in the contract as above referred to. No time is by law allowed to the debtor to redeem.

2. Evictions are not of frequent occurrence.

Improvements.

1. Farm steadings, properly so called, there are none in this island. The tenants inhabit houses belonging to themselves in the villages, or by sufferance houses belonging to their landlords, for the safe keeping of which they are responsible.

In the case of holdings in emphyteusis for a limited period of years, at the end of the prescribed term, as also on eviction for non-fulfilment of the conditions of lease, the tenant is entitled to full remuneration for all improvements effected during his occupancy. But it is optional to the landlord to pay down the amount in money, or to convert the capital into an annuity redeemable at the rate of 6 per cent.

The same rule applies to urban property held in fee, the only species of property which, according to law, can now be held by that tenure.

In the case of colonical holdings, the landlord is bound to contribute half the outlay on all extraordinary expense incurred for improvements, on their being effected.

On the termination of his lease, or on being evicted for sufficient motives, by a judiciary sentence, the colonical tenant has no claim for compensation of any kind.

Miscellaneous.

1. Ostensibly, at least, friendly. As all classes are equal in the eye of the law, the rights of all are equally guaranteed, or ought to be.

2. For modes of cultivation, and style of living, see Answers to Queries 7 and 11, under the head of "Small Proprietors." Where every householder is in some sense a proprietor, the chief distinction between one man and another, lays in the superior or inferior degree of education. All ranks are thoroughly penetrated with a sense of the advantages attendant on a good education, and strain after it with amazing eagerness. Great industry is the leading characteristic of the rural population. Their habits are those of the strictest economy. Poverty, in the general acceptation of that term, is rare among them, and a state of absolute destitution rarer still. Hence, they find little difficulty in raising loans in proportion to the value of their property, and their reputation for honesty, industry, and sobriety. The institution of the Ionian Bank has, in this respect, been productive of incalculable benefits to the industrial classes of this island.

3. No comparative difference has ever been remarked in this respect.

4. See Answer to Query 9, under the head "Small Proprietors."

5. See Answer to Query 13, *id.*

6. Not in modern times, at least. When the Venetians established military colonies in the island, after the expulsion of the Turks, A.D. 1502, they rounded out the holdings of their military tenants by the appropriation of waste lands belonging to the large feudal proprietors. This arbitrary measure, to which the present class of "small proprietors" owes its origin, the Senate condescended to justify by reasons set forth with so much *naïveté*, that they provoke a smile. Had any measure of this sort been attempted in more recent times, it would have been resisted to the death, as a violation of the great and essential principle of justice, according to the definition of the greatest of Roman legislators :—

"Justitia est constans et perpetua; voluntas jus suum cuique tribuendi."

7. No case of the kind has ever occurred to my knowledge.

8. See Answer to Query 6.

9. None.

10. There is no provision for furnishing loans in furtherance of any such object, either by law or otherwise. A strong desire prevails among the class of colonical tenants, and those holdings in emphyteusis to become, by purchase, the absolute proprietors of their holdings. With this view they are disposed, at all times, to make any sacrifice, often contracting loans of money at ruinous rates of interest.

11. From the mode in which land occupation. as heretofore described, is regulated, and the abolition of feudal tenures, and the law of entail,* it becomes manifest that the direct tendency of the laws on property is to discourage the accumulation, and favour the dispersion of land.

Copyhold.

Tenures strictly resembling the copyholds of England are unknown in this island. Leases may be granted in perpetuity, in the cases of colonical holdings, or in emphyteusis. But formal leases for a limited term, whatever the nature of the tenure, are only held valid in law for a period of thirty years, to which they are always reducible; any stipulation by contract to the contrary notwithstanding.

The laws on tenant right, however, provide for a lessee continuing to occupy after the regular expiry of his lease, by tacit reconduction ("tacita riconduzione"), for an undefined period; and should this species of occupancy be allowed to run on beyond thirty years, the tenant acquires a prescriptive right of possession, and becomes irremoveable.

No. 6.

Consul-General Saunders to the Earl of Clarendon.—(Received November 15.)

My Lord, *Corfu, November 9, 1869.*

I HAVE the honour to transmit herewith, for your Lordship's information, copy of a despatch which I have addressed to Her Majesty's Minister at Athens, together with the accompanying duplicate of a Report forwarded therewith, on Land Tenure in this island.

I have, &c.
(Signed) SIDNEY SMITH SAUNDERS.

Inclosure 1 in No. 6.

Consul-General Saunders to Mr. Erskine.

Sir, *Corfu, November 4, 1869.*

WITH reference to your Excellency's despatch of the 17th September last, inclosing copy of a despatch, together with its inclosures, from Her Majesty's Principal Secretary of State for Foreign Affairs, requiring the fullest information in regard to the laws and customs affecting the tenure of land in this island, I have the honour to submit the accompanying Report and Replies to the several queries on the points therein referred to.

I must, at the same time, beg to apologize, not only for the detention which has occurred in the transmission of this Report, but also for the unavoidable length to which its details have extended, as well as for occasional repetitions arising from the intimate relations of some of the matters adverted to.

It will, however, be observable that the complications derived from ancient systems of tenure of a peculiar character, recognized and enforced by Ionian Laws, partially abrogated in the sequel by Hellenic legislation, giving rise to a series of perturbations, and further perplexed by a new rural system grafted on the former, together with subsequent modifications thereof, constitute in the whole an intricate labyrinth of associations difficult to penetrate, more difficult to define.

I have, however, ventured to assume that, under these circumstances, undue brevity would be less venial than prolixity—precipitation more compromising than delay.

I have, &c.
(Signed) SIDNEY SMITH SAUNDERS.

Inclosure 2 in No. 6.

Report on the Laws affecting the Tenure of Land in the Ionian Islands.

Population of Corfu.

Urban	17,114
Suburbs	8,197
Islets	1,717
Rural	46,165
Total	73,193

The foregoing results were obtained from the last census of 1864, which forms the basis of the present electoral lists as regards the population of the respective provinces of the Hellenic Kingdom.

Area and ratio. The total area of this island being 227 square miles, this would be in the ratio of abont 315 to the square mile, deducting the population of the islets as above.

Movement slow. The tendency to increase has been slow and inconstant, having been at the rate of less than three-quarters per cent. on an average of twenty years from 1844 to 1864; the official returns for the first-mentioned year giving a total of 64,676.

Decrease, 1836 to 1844. The statistics of the previous census in 1836 give the population at that period as amounting to 65,107, thus exhibiting a decrease during the intervening eight years as follows:—

Years.	Town.	Suburbs and Islets.	Rural.	Total.
1836	16,043	8,596	40,468	65,107
1844	15,864	8,246	40,566	64,566

It will be observed that the rural element remained nearly stationary during this period; the decrement having occurred in the town and suburbs.

The population of the whole of the Ionian Islands, according to the census of 1844 and 1864 was as follows:— Returns for a. Ionian Islands.

Is ands.	Area in Square Miles.	Population.		Average Increase per Annum.	Annual Increase per Cent.	Population to Square Mile in 1864.
		1844.	1864.			
Corfu	227	64,676	73,193	425·85	0·66	322
Paxo	26	5,017	5,321	15·20	0·30	205
Santa Maura	180	18,676	21,019	117·15	0·63	117
Ithaca	44	10,821	11,950	56·45	0·52	272
Cephalonia	348	69,984	80,979	549·75	0·79	233
Zante	156	38,929	44,760	291·55	0·75	287
Cerigo	116	11,694	14,490	139·80	1·20	125
Totals	1,097	219,797	251,712	1,595·75	0·72	229

According to the official returns for the four following years it would appear that in the three principal islands the following results have been obtained:— Births and Death

Island.	1864. Excess of—		1865. Excess of—		1866. Excess of—		1867. Excess of—	
	Births.	Deaths.	Births.	Deaths.	Births.	Deaths.	Births.	Deaths.
Corfu	619	..	63	..	..	41	..	131
Cephalonia	509	..	703	..	494	..	298	..
Zante	461	..	..	529	..	136	..	74

The large increase of deaths over births in Zante during the year 1865 may possibly be attributable, in the absence of any special endemic causes, to the number of reapers who are accustomed to proceed to the Morea for the harvest, and who frequently return in a sickly condition; a greater temptation, however, being presented the first season after the union with Greece.

The number of marriages contracted during the corresponding period. and their ratio to the population as given in the official Returns, have been as fallows:—

MARRIAGES.

Years.	Corfu.		Cephalonia.		Zante.	
	Total.	Ratio.	Total.	Ratio.	Total.	Ratio.
		1 in		1 in		1 in
1864	401	187·86	475	154·88	363	149·47
1865	676	133·27	483	192·39	308	145·32
1866	472	190·87	420	221·26	259	172·81
1867	733	123	358	236	245	161

As compared with other parts of the Hellenic kingdom it has been observed, that the ratio of marriages to the population of the respective provinces in the year 1867, has been the highest at Corfu and the lowest at Cephalonia. This may possibly be ascribed, on the one hand, to the large olive crop at Corfu in the winter of 1866-67; and, on the other, to the losses occasioned by the earthquake at Cephalonia in February 1867.

It would, however, appear that marriages are less frequent in these islands and Continental Greece than in other European countries; which circumstance has been considered attributable in some respects to the precarious resources of the population; the per-centage rate being nearly the same in both cases, on an average of three years up to 1864, namely:— Comparative rati with other countries.

Marriages in 100 inhabitants—

Ionian Islands	0·62
Continental Greece	0·6066

As compared with the alleged ratio of—

England	0·80
France	0·82
Italy	0·82

Religions.—Of the total population of this island the entire rural, and about two-thirds of the urban, belong to the Greek Church, the residue consisting of Roman Catholics and Hebrews in nearly equal proportions, namely from 4,000 to 5,000 of each denomination. The few Protestants are exclusively foreigners.

These results are represented in round numbers in the following summary:—

POPULATION OF CORFU.

Greek Church—	
Rural	46,000
Urban, suburban, &c.	18,000
	64,000
Roman Catholics—	
Rural, urban, suburban, &c.	4,500
Hebrews—	
Rural, urban, suburban, &c.	4,500
Total	73,000

Staple products.

Industrial Pursuits.—The staple products of Corfu are oil and wine; a small quantity of corn, principally maize and barley, being raised for home consumption.

Cultivable area. Olive groves.

Of the total area, equal to about 145,000 acres, from 120,000 to 125,000 may be considered as available land, where of three-fifths at least (say 72,000 acres) are dedicated to olive plantations, which, at a low average of six tries to the acre, would give a total of about 432,000. But considering their dense and injurious proximity in many localities, with some occasional tracts not in bearing at the same period, whereas the oil exported through the Custom-house in favourable seasons has amounted to upwards of 250,000 barrels (of 16 gallons each), while allowing some 50,000 barrels for home consumption, and reckoning each tree as giving, one with another, an average rate of about half a barrel of oil, the total number of olive trees in this island must considerably exceed 500,000

Olive crops.

Such a crop, indeed, is of rare occurrence, perhaps about once in ten years, not more than half this quantity being produced under ordinary circumstances every alternate year, though subject to frequent vicissitudes, whereby a large proportion of the produce is often irretrievably lost.

Neglected state of olive groves.

These olive groves, as a general rule, in this island, with some rare exceptions on the part of individual proprietors, are left wholly uncultivated and neglected until the period of collecting the fruit, which is allowed to fall of itself, no care being bestowed upon the trees, and agricultural labour being therefore restricted to the vineyards and arable lands.

Agricultural labour restricted to 50,000 acres out of 120,000.

Assuming these taken conjointly to constitute about 50,000 acres (in the proportion of about 4 of the former to 1 of the latter), the population addicted to their culture would be thus increased in the proportion of about 12 to 5 (say about 600 to the square mile), whereas it would otherwise scarcely average 250 to the square mile.

Wine.

The wine made here is of inferior quality, selling at low prices, and scarcely keeping beyond the year, being almost entirely used for home consumption. This result can only be attributable to bad management, though the culture is carefully attended to and the produce good.

Distribution of area.

The following summary exhibits the total distribution of the land according to the foregoing computations:—

COMPARATIVE SCALE of Cultivated and Uncultivated Land at Corfu in 1836 and 1869.

Distribution.	Square Acres in 1836.	Square Acres in 1869.
Olive groves	74,036	72,000
Vineyards	34,684	40,000
Arable	11,967	10,000
Pasture	12,273	11,000
Uncultivable	12,320	12,280
Totals	145,280	145,280

LAND OCCUPATION.

System of tenure.

The system of tenure in the Island of Corfu is mainly derived from ancestral titles and customs established under the Venetian rule. It essentially differs from any prevailing in the other Ionian islands or Continental Greece, and has given rise to much dissension of late between landlords and tenants. No material changes therein may be deemed to have taken place under the British Protectorate, the old Venetian laws and customs having

served to regulate all such matters until the year 1841, when the Ionian Civil Code and certain special enactments for the purpose of regulating forms of procedure, were brought into operation; the original contract stipulations between the parties being respected by the Ionian Legislature.

No sooner, however, were these islands annexed to the Kingdom of Greece, than the rural element, whose extravagant expectations were the natural result of designing agitation, began clamouring for the abolition of proprietary rights, with the view of exempting tenant-holders from all conditions and liabilities affecting their position as such, while retaining the property in their own hands. Rural agitation.

The nature of the several tenures is as follows:— Tenures.

1. Portion-tenure in co-partnership with the landlord in varying proportions for a term of years or in perpetuity, and applicable to the great majority of cases.

2. Leaseholds for any specified period.

3. Long-leaseholds (for a period in no case less than twenty years as enjoined by law); and assignments in perpetuity, differing only from the former in duration, and in both cases at a fixed rent. (See Tenure.)

These three descriptions of tenure, though constituting different titles in law, are indispensably founded in all cases on written engagements, and the rents payable either in money or in produce according to the respective agreements. Notarial contracts.

This system originated in colonists of Venetian origin, who, having obtained tracts of land (for the most part encumbered and waste) which they were unable to cultivate themselves, made these over to others for this purpose, on conditions recognized and provided for by law, and codified by the Ionian Legislature in 1841 for the security of all parties concerned. Origin of portion-tenure here.

Thus the occupant remained undisturbed in his holding for the stipulated period so long as he conformed to the terms of his contract, the landlord having the power of eviction in certain cases for breach of covenant.

But in cases of portion-tenure, this continuing title of occupancy was not associated, as a necessary consequence, with actual payments in produce, or their pecuniary equivalent; such proportionate rent being in most cases determined by appraisement of the crops at prescribed periods, as established upon fixed principles laid down by law, regulating and defining such fluctuating tendencies. Continuing title. Fluctuating rent.

Whensoever the property reverted to the landlord, whether by expiration of agreement or by eviction from the tenant's default, the latter was entitled to compensation for all improvements, according to the system defined by law for the several descriptions of tenure; *the value of such improvements*, whether consisting in buildings or cultivation, to be determined by appraisement. (See Improvements.) Compensation for improvements.

The circumstances which have caused a revision of the laws affecting this system are thus described in a Memorial addressed to the King by the landed proprietors of Corfu in January 1866, with the view of inducing His Majesty to withhold the Royal assent to a Bill which had then recently passed the Legislative Chamber at Athens, seriously affecting their territorial rights:— Alteration of laws affecting tenure.

"The rural property at Corfu rests upon a peculiar basis. The owners of such property, for the most part transferred their possessions to agriculturists, either for a limited time or in perpetuity, for the purpose of being cultivated, on payment to the proprietor either of a clear proportion of the produce, according to the particular agreement, or of a fixed annual or biennial contribution in kind or in money. As the cultivators might abusively appropriate all the proceeds, neglecting to pay the owners the portion due, or the stipulated rent, the Ionian laws, from the remotest periods, provided securities for the rights of the owners the most potent of which was that of personal arrest; and finally the right of the latter to recover his property when the holder either neglects to cultivate or to pay his proper contributions for three years. Landlords' grievances.

"The Legislativ Aassembly has not only suppressed personal arrest, which was the landlord's best guarantee, but has proceeded to the incredible extent of suspending for an indefinite period the exercise of his right to recover his property in order to dispose thereof according to his own will and pleasure."

By the enactment to which the Memorialists refer, the ostensible object of which was to assimitate the laws and ordinances of the United Kingdom of Greece, it was at the same time specifically provided that "The prescriptions of the Ionian law (of 1841) respecting the appraisement of the olive crop, are abolished from the introduction of the Hellenic Judicial system ($\frac{1st}{13th}$ July, 1866), and those of Hellenic law, as regards personal arrest, are equally applicable to the Ionian Islands from the publication of the present law ($\frac{20th\ January}{1st\ February}$, 1866). R.N. Law (No. 150), January 20, 1866. Appraisement of olive crops abolished. Power of arrest annulled.

"The provisions of the Ionian Code respecting the reintegration of territorial rights, Reversions suspended *sine die*.

are suspended from the publication of the present law until the emanation of the Hellenic Civil Code.

Debtors liberated.

"Any persons who, contrary to the provisions of Hellenic Judicature, may now be detained in the prisons of the Ionian Islands, are to be forthwith liberated."

No basis left for rent.

Upon these points, whereby the whole system of tenure was subverted, and predial engagements rendered nugatory, the Memorialists comment as follows :—

Landlords' grievances continued.

"From this it is manifest that the property title left is purely nominal; because, while it becomes impossible for the landlord to collect his rent, he cannot even dispose of his land or administer it in his own way, it being *de facto* transferred to the holder, who has the right to retain it whether he cultivates or not, withholding with impunity the landlord's dues.

"The arbitrary character of the new law is brought to a climax by altering the stipulations which, founded upon existing contracts, secured to the landlord, without detriment to the tenant, and indeed with his assent, the means of ascertaining the produce of olive trees, in order to determine the portion due to the tenant; while, in lieu of agreements entered into by the contracting parties, a law has been substituted in no wise applicable to the appraisements of fruit ready to fall, and tending to injure the proprietor by exposing him to the arbitrary discretion of interested parties."

In spite however of these remonstrances on the part of the landed proprietors, the Bill in question received the Royal Assent shortly afterwards.

Dismay of landed proprietors.

Such a result naturally spread consternation and dismay among the landed proprietors, whose interests become seriously compromised thereby; their territorial rights being made to depend, not upon covenanted conditions and reciprocal obligations, but upon some remote contingencies of future legislation.

Elatement of rural element.

When moreover the period had arrived for making the usual appraisements of the olive crop under portion-tenure, the rural classes assumed to themselves a virtual transfer of the property to them, and refused to recognize any longer those conditions of tenure under which they had acquired certain vested interests, but subordinate to specific liabilities, and subject to pains and penalties for non-fulfilment, abolished in like manner.

Prefect's Proclamation.

A Proclamation* was then issued here, with the view of inducing the tenantry to come to some amicable arrangement with the respective proprietors, as regards appraisements of the produce, on the basis of which alone could the portion due to either party be determined.

But the tenant-holders, strong in their convictions and abetted by their Representatives in the Chamber, strenuously persisted in resisting such pretensions; and the landlords had therefore to submit to the forfeiture of all share in the olive crop of that year, such being, in most cases, their principal source of income.

This usurpation successfully accomplished, the tenants considered themselves emancipated from all predial obligations, and independent of proprietary rights; while the evicted landlords could only hope to repair by subsequent legislation the palpable spoliation perpetrated in this respect.

New Rural Property Law. (No. 244.)

In the following session therefore, the Government, seeking to palliate this injustice, introduced another measure of a complicated character which became law in 1867, the tendency of which was, to enable either party to such portion-contracts to exercise the option of terminating their co-partnership; the property in such case passing into the hands of greater shareholder (usually the tenant), it being open to the minor party in the social compact (or specifically to the landlord if equally divided), to claim his corresponding *quota* of the property itself. Otherwise the farmer is to indemnify the latter by commuted payments in ten annual instalments (bearing 6 per cent. interest, as subsequently provided); the relative value of the respective portions being determined by appraisement, and comprising, on the tenant's behalf, "the value of all buildings appertaining to agriculture." Also others when the landlord sues. (See Improvements.)

Article 53.
Article 54.
Article 59.
Buildings.
Article 56.

Cultivation.

Should the tenant, however, have no title under contract to any share in the land (as always comprised anterior to 1841), he is also to receive, on the dissolution of the co-partnership, the extra value accruing to the estate from his cultivation; while reserving to the tenant, in the latter case, the right of attachment. (See B. 2.)

Compensation on eviction.

In long leaseholds and assignments, the holder became entitled, in either case, to purchase the freehold, on the basis of his capitalized rent at six per cent., with the like facility as to liquidation in ten annual instalments. But in the event of termination of agreement, or eviction from the tenant's default, such holders are entitled to compensation for all improvements, whether in buildings or cultivation, as existing on the premises at the time of restitution, as provided by the Ionian Civil Code, Article 1680; the basis of

* Parliamentary Papers, 1867. Despatches respecting the Ionian Islands, page 40.

appraisement differing only in some respects according to the circumstances of reversion, by default or otherwise. (See Improvements.)

Finally, all outstanding agricultural debts, of whatsoever nature, anterior to this Law, are made payable in similar instalments. Rural debts.

The reintegration of the landlord in his territorial rights was also provided as formerly, in the event of non-payment of his dues for three successive years or two biennial olive crops. Reversions to landlord.

Such are the most essential provisions of the new Law.

A separate law was at the same time passed, regulating upon new principles the appraisement of olive crops. New appraisement of olive crops.

It was soon observed that these provisions were in many points defective and objectionable, and that even the text of some of the Clauses had been tampered with, by the omission of interest, which gave rise to further discussion in the ensuing Session; the result being that two supplementary laws, modifying the former, were subsequently passed, facilitating the mode of appraisement aforesaid, and extending the period for effecting the same to the advantage of the rural classes, while providing for the payment of interest at 6 per cent. on all protracted instalments. Subsequent modifications.

Furthermore, in lieu of any other effective means of enforcing payment of rents, it has been provided that, if not recoverable within two months after falling due, the tenant shall be provisionally evicted from the property (on which, however, he is not usually accustomed to reside) until such payment is made, the administration thereby falling into the hands of the landlord, while, however, reserving to the tenant his rights over the property and produce. (See Evictions.) Provisional eviction.

The arrears due for the last two years are likewise recoverable, in accordance with certain other provisions of Hellenic Law. Arrears payable.

Such is the present system of land occupation in this island, originating several centuries ago, maintained unimpaired until a recent period, subverted by subsequent legislation, and more or less readjusted in the sequel as already explained.

The prevalent public opinion thereon will be adverted to under Query No. 13 A.

(Signed) SIDNEY SMITH SAUNDERS.

Corfu, November 4, 1869.

Annex.

(A.)—Small Proprietors.

1. The quantity of land usually held by each is very variable and often widely dispersed, having been frequently divided and subdivided by dowry allotments and inheritance, until, in many cases, the portions appertaining to a single individual have become infinitesimally small, and often so intersected and blended with other properties, as to be only definable by local tradition. Division of land.

This is more especially the case in regard to the olive groves, where it not unfrequently happens that one or more trees belonging to some other petty proprietor, may be completely surrounded by those of another proprietor, involving detrimental passage rights; and several individuals may even have a joint title upon a single tree.

Professor Ansted, in his work on the Ionian Islands, published in 1863, observes—"It is a remarkable fact in Corfu, that almost every grown male in the island has some land, or some rights over land. These consist partly in olive groves and partly in cultivable lands, which again are either covered with old vines or are arable. There are, however, no divisions of land whatever in the olive groves, and the oldest inhabitant has to be referred to in the case of any doubt as to the proprietorship of particular trees" (p. 455).

2. The Ionian Civil Code, still in force here, makes no distinction between real and personal estate. The right of inheritance on the father's side is vested in the male line, per capita or per stirpes as the case may be (Article 606), but, failing this, in the female (Article 632), with right of participation to daughters in the second degree where any of the sons may have died without male issue (Article 630); or, otherwise, daughters and their descendants are entitled to receive a proportionate dowry from the estate, whether married or single (Article 631); but sons and daughters and their descendants inherit equally per capita or per stirpes on the mother's side (Article 633). Testators can dispose absolutely of one-quarter to one-half. Law of inheritance

3. The legal method used for the sale, transfer, exchange, or division of such Notarial sales, &

properties, is by notarial act, the original deed being signed by the parties in the notarial register, and certified copies thereof, when required, being delivered to the parties themselves on stamped paper of the prescribed valuation.

The cost of such transactions is comparatively insignificant.

Loans. 4. No special facilities have ever been afforded by the Government for raising loans upon such properties, although an Agrarian Bank has often been advocated for this purpose.

The Anglo-Ionian Bank has been in the habit of making such advances on approved personal security, not so much for the purpose of buying off family charges, or for improvement of the property, as to enable parties to meet other engagements from such loans.

The terms for these advances are 7 to 8 per cent. interest, payable in advance; the legal interest being 10 per cent.

Mortgages. 5. Small proprietors connected with the rural classes are scarcely in a position to offer adequate securities to any responsible banking establishment for such advances.

Consequently such parties can only have recourse to private capitalists for this purpose, the rate of interest required on such occasions being in proportion to the nature of the security and the necessities of the individual. As a general rule the rural classes may be considered as encumbered with debt, which, however, they generally seek to meet by selling produce in advance at a ruinous sacrifice, with increased liabilities should that produce fail.

Fictitious sales have often been resorted to in security for such advances, the property being leased in return to the nominal vendors at a stipulated rent, with corresponding declarations of nullity in the event of such rent being duly paid; but these transactions have been strictly prohibited by the new law under heavy penalties.

Legal interest. The recognized legal interest in all matters connected with land is 6 per cent.

Registration of mortgages. 6. Mortgage and other privileged claims upon such properties, are henceforth, under the new Greek law, available only from the time of such titles being duly recorded in the respective local registry office, and in a special book dedicated to this purpose according to the French system; such liabilities, until formally cancelled, following the property into whatsoever hands it may subsequently pass.

For the registration of existing titles of this nature four years have been allowed, under pain of nullity at the expiration of that period.

The expenses connected therewith are trivial; consisting of a small per-centage, or tariff dues for particular deeds not subject to valuation; and of stamped paper for copies deposited or certificates issued.

Agriculture. 7. The crudest notions of agricultural principles prevail here, nor in any systematic rotation of crops habitually practised by the farmers, who, according to the position and quality of the soil, have been accustomed, from generation to generation, to tax its productive powers in whatever manner, time, and circumstances may have permitted.

It is, indeed, a well known fact, that tradition is held in extreme veneration in Eastern climes; not only influencing all the relations of social life, but constituting a guiding principle in all familiar habits; from which it would be deemed little less than sacrilege to deviate, under the promptings of schismatic doctrines or heterodox innovations of any kind, contrary to ancestral precepts, to which the uneducated classes are intensely bigoted.

Thus, the only system recognized and applied here, is that of a capricious and exhaustive process; having no means of artificial irrigation; no manuring, unless in exceptional cases; no leguminous alternations; nothing of a recruiting tendency beyond semi-annual periods of following relief.

The mode of tillage is also of the most primitive description; the antiquated ploughs and other implements employed for this purpose, scarcely differing in any essential degree from those which may have been handed down from the time of Hesiod.

The Corcyræans, in fact, do not appear to have inherited any agricultural predilections from their Homeric ancestors beyond a devotional attachment to their implements of husbandry; and indeed, as Professor Ansted remarks (loc. cit., p. 455), "there is really comparatively little done in the way of agriculture."

Pasturage. A general right of pasturage prevails over all waste lands and olive groves, excepting when the produce of the latter is about to fall, when such right is suspended, with liability to fines for transgression.

The proportion between tillage and grass lands may be considered nearly co-equal, as already explained under the heading of "Industrial Pursuits."

Woods and forests. This island is entirely destitute of woods and forests.

Machinery. 8. No machinery is used in aid of manual labour.

Hired labourers are employed at particular seasons as occasion may require, more especially for the pruning, digging, and re-levelling of the vineyards, as well as for the gathering of the produce, whether grapes or olives, and ordinary tillage; but during the dry summer months they remain for the most part without employment, which serves to impart a listless character to the whole rural population. Hired labourers.

The average number of hired labourers to the acre, distinguished from others of their class, cannot be defined, as from time to time nearly the whole able-bodied population, including females, are indiscriminately engaged in the most laborious occupations for themselves or others, under the pressure of simultaneous requirements. Female labour.

Agricultural labourers are not accustomed to live upon the property of their employers, nor indeed to have any permanent engagements of the kind: their daily wages, according to the nature of the work to be performed, and the exigencies of supply and demand, varying from about 1*s.* 6*d.* to 2*s.* per diem for men, and generally 1*s.* for women. Wages.

9. There is no emigration from hence of agricultural labourers, the rural population being already too scanty, and requiring an influx of Christian families from the adjacent Turkish territory to co-operate on all occasions of a favourable olive crop. Emigration.

10. Small proprietors, and others of rural origin, usually reside in their native villages; the upper classes, with very few exceptions, residing in town, though possessing country-houses on some of their estates. which are generally closed during the greater part of the year, but to which they chiefly resort for the vintage alone. When, however, their property is free from tenant-holdings, they usually farm out the land, or the pending produce in oil, for one season at a time, to some of the neighbouring villagers, receiving a stipulated portion of the produce free of all expenses, while, however, making their own wine and attending to the vintage themselves. Where residing.

Under such circumstances, the great bulk of the gentry are regarded and criticized as *quasi* absentees, such characteristic being rather applied as a landlord's penalty than a tenant's infliction, the property being abandoned in the main to the sub-proprietor's discretion as a shareholder, and the agent's duty being chiefly confined to the collecting of the landlord's dues and the keeping of accounts. Absentees.

11. The village houses are usually built of stone, sufficiently commodious, according to the circumstances of the family, and mostly appertaining to the occupants themselves. Village houses.

The food of the peasantry is rather of a low standard, blended with a plentiful admixture of herbage and oil, together with native wine, and occasional meat, but few cultivated vegetables, for which they chiefly resort to the town, which is plentifully supplied by Maltese settlers. Food.

The clothing of the tenantry is substantially good, and on their not unfrequent festivals the men are smartly clad, and the women profusely decorated with golden ornaments, which, however, are often deposited at intervals in the Government Pawn Establishment or Monte di Pietà, to be redeemed as occasion may permit; the gradation and extent of such display serving as a kind of metrical index of rural prosperity. Clothing.

Their general circumstances however are necessitous, living from hand to mouth, and much involved in debt; recklessly improvident on all occasions, and accustomed to look to their patrons for pecuniary advances in seasons of distress, which the latter, under the altered circumstances of penury and distrust, are no longer either able or willing to supply. General condition.

12. The average population of the rural classes, per acre, is very nearly equal to the actual cultivated area, exclusive of that occupied by olive plantations as aforesaid, namely, 46,165 souls (in 1864) to 50,000 acres of vineyards and arable land—the annual increase in the whole population of this island, on an average of twenty years (1844 to 1864) having been at the rate of 1 in 151·87 or about 0·66 per cent., whence the population would become doubled in the space of 105 years, as compared with the whole of Greece (according to the latest statistics) in 77 years, Italy in 83, &c. Ratio of rural population to cultivated area. Rate of increase.

As a medium of comparison between the respective classes it may be added, that the increase of the urban and suburban population, on the average of the aforesaid period, has been at the rate of 145·90 per annum, being 1 in 165·25, or 0.60 per cent., while that of the rural population was at the rate of 279·95 per annum, being 1 in 149·90, or 0·69 per cent. Comparison with urban population.

13. The prevalent public opinion as to the advantages or disadvantages of any part of the above system, may be divided under two heads, as contemplated from the landlord's or the tenant's point of view. Public opinion.

The landlord considered the power formerly conferred under the Ionian Law, of arresting his tenant for non-payment of rent, as a vital principle, that of distraining instead being altogether illusory; to which, however, has now been superadded provisional eviction Provisional eviction.

after the lapse of one year and two months, which may be deemed so far advantageous as serving to exercise some minor degree of coercion.

ıb-letting. He would also have wished to retain the power he formerly possessed, of giving or withholding his assent to sub-letting, more especially in co-partnership tenure, and the preference of pre-emption on the sale of assignments, for he can otherwise have no security against any kind of tenant or associate who may be foisted upon him.

Above all he complains of the encouragement given in the first instance to projects of rapine and usurpation, by hastily and inconsiderately subjecting him for a time to a virtual spoliation of his proprietary rights, by the so-called "assimilation law" of January 1866; whereby not only was the power of arrest for nonpayment of rent superseded as aforesaid, but also the statutory provisions for the apprizement of olive crops (under the Ionian Law of 1841) recklessly abrogated without a substitute, while his title to the reversion of his property in the event of non-payment of rent for three years was in like manner indefinitely left in abeyance until some eventual codification of Hellenic Law, thereby depriving him, in the former case, of any basis for the recovery of produce under portion-tenure, and at the same time holding out a palpable encouragement to the extravagant pretensions entertained by the rural classes to consider themselves as the rightful and irresponsible possessors of the soil.

Although these legitimate grievances on his part have been more or less recognized and redressed, being allowed to recover by attachment of produce his arrears for the last two years, his former reversionary title having also been restored (not reckoning the said suspensory period however), and a new system for the appraisement of crops having also been instituted upon more advantageous principles, be it said, as affecting the portion-tenants; yet the evil impressions inspired in the interim by such crude legislation cannot be so readily suppressed, nor their noxious influences during nearly two years' growth (till November 1867) promptly eradicated.

Tenants, on the other hand, can only have cause to rejoice in the several concessions made in their favour; although starting with a fixed idea of appropriation, and disappointed therefore in their original anticipations of becoming altogether independent of proprietary interference, while reducing their landlords to the position of mere titular incumbents on sufferance.

It cannot, however, be questionable, that the efforts made to reconcile these contending interests have been so far successful of late, that such hostile manifestations have to some extent subsided; but the test of time can alone suffice to determine how far the eventual results may be found to correspond with an equitable adjustment of proprietary and tenant rights, and to appreciate the practical application of these remedial measures.

(B.)—Tenants and Sub-Tenants under Landlords.

Tenure.

ending of classes. 1. The tenants and small proprietors among the rural classes are so intimately blended together as to offer no adequate means of discriminating between the two positions referred to. They frequently partake of both characters in different holdings; and in fact it is a manifest convenience to all parties, for small proprietors or portion-tenants in perpetuity (constituting to all intents and purposes a small proprietary title, with an eventual claim in many cases to a definite quota of the land itself), to rent adjacent property belonging to some distant owner whose lands may be widely dispersed.

The same imperceptible gradations in the social scale characterize the rural classes as a whole from proprietor to peasant, so that while differences of tenure may be open to definition the only intelligible distinction between different classes of the community is that of the line which is commonly drawn between the rural and the urban, or suburban population.

It is not customary here, as a general rule, to find small cottiers living on the land they cultivate and exclusively dependent upon this; consequently no measure of quantity can be assumed as a usual standard of comparison in such exceptional cases.

fferent tenures. 2. The tenure of rural property, as laid down by the Ionian Civil Code of 1841, may be classified under the following titles, namely:—

1st. Tenancy in copartnership between landlord and tenant, for a term of years or in perpetuity, each party being entitled to a specific portion of the produce, and the latter having an eventual title to a determinate quota of the property in a corresponding ratio if anterior to 1841, or if expressly set forth in subsequent contracts, failing which no such right is conferred in the latter case.

2nd. Simple leaseholds at a fixed rent for a stipulated period.

3rd. Long leaseholds to be held for a term of years, or as assignments in perpetuity, at a quit-rent payable in money or in produce as defined by contract, the property reverting to the landlord entire in certain cases of default or contravention, with a legal title on the part of the lessee in all cases to compensation for improvements, to be settled by appraisement. (See Improvements.)

It is further provided that such leases, if of temporary duration, shall in case be limited to less than twenty years ("non potranno essere mai minori di anni venti"). Article 1,653.

There is also a fourth description of tenure associated with ex-feudal property, more particularly adverted to under Query B 5.

In the foregoing tenures, all subject to written agreements, the parties may covenant upon any terms and conditions they please, in so far as not otherwise prescribed by law. But in the absence of express stipulations on particular points the following regulations are laid down as to subletting and other matters adverted to in the following Queries:—

In cases of co-partnership in portion-tenure, the tenant could in no wise transfer his rights and obligations to another individual without the landlord's express consent in writing. Sub-letting.

In simple leaseholds the tenant was always empowered to sublet unless expressly prohibited by the terms of the contract.

In long leaseholds and assignments the tenant was bound, under pain of nullity and forfeiture, to give due intimation to the landlord of the precise terms and conditions under which such beneficial interest was to be transferred; the latter being allowed one month to reply, with the option of claiming the preference upon the same identical terms, subject to appraisement of improvements in case of fraud, his assent being implied by silence. Should he decline to avail himself of such option, while dissenting from the transfer, the tenant, though not restricted from effecting the same, became responsible in common with all other interested parties, for the payment of the landlord's dues by the new tenant.

By the new rural law, however (of 1868), specially applicable to this island, it was provided that in all cases the portion-tenant, or long lease-holder, or assignee, can alienate his subordinate rights without personal responsibility by delivering to the landlord or lessor through a competent channel, a copy of the agreement within one month of completion for his information and guidance under pain of nullity, without any restrictions being available to the landlord on such occasions. Article 68.

3. The general rules laid down by the Ionian Civil Code (still in force here in such matters) prescribe that all agreements for letting houses or rural property ("case e beni rustici") must be made in writing, with the exception of a transitory tenure which, in the absence of written agreement, the law recognizes as limited, in the case of houses, to three months; and in the case of rural property, to such period only as may enable the holder to collect the crops ("si riputeramo stabilite per quel solo tempo ch'è necessario affinchè il locatario raccolga tutti i frutti del fondo locato"). Agreements in writing. Limitation of paro agreements. Article 1,572.

The same rule applies to lapsed leases and other provisional occupation of rural property. Thus, in arable land, such transitory holding would terminate in June or September, according to the nature of the crops; vineyards in October, olive groves when denuded of fruit, in the spring, and the like.

4. Such written agreements are drawn and registered by every notary public, according to the system described under Article 3. Notarial contracts.

5. With the exception of the tenures already adverted to as resting upon specific agreements, the only cases to which any law or custom applies, "whereunder a tenant is considered as having a right to remain in occupation of his holding so long as he punctually pays the stipulated rent, or a rent to be determined from time to time by some local tribunal or by agreement, subject to arbitration are the tenant rights associated with considerable ex-feudal property allodialized in 1825 by an Act of the Ionian Legislature (Act No. 36 of the 2nd Parliament). Ex-feudal tenancies.

The occupants of these manorial domains have been accustomed from time immemorial to enjoy an uninterrupted title of possession so long as they paid the stipulated rent, in money or in produce, to the ex-feudatory proprietor.

By a subsequent Act of the same Parliament (No. 67 of the 24th March, 1827) it was provided that such payments in kind should be commutable to a money value at any time whensoever the "Contributors" might deem fitting upon the basis of a computation involving certain deductions for dues formerly payable to the local Government by the then feudatories and renounced in their favour.

In the absence of ancient contracts to define the commuted rent, recourse was to be had to other contemporary contracts of a like nature, or to the ancient anagraphs, or to feudatory receipts of the earliest period, or to the prices of produce when first covenanted,

at the option of the Contributors, subject to judicial examination and control in case of dispute.

Provisions to a similar effect have been incorporated also in the new Hellenic Law.

It was further enacted by the aforesaid Ionian Law (Article 10) that such commuted rents should be perpetually redeemable at the option of the Contributors, on payment of the capitalized equivalent at 5 per cent., which now, subject to some further rebate on commutation, has been fixed at 6 per cent. (See copyhold.)

'enant can sell ithout consent.

6. The tenant can now sell his interest in any holding, under whatsoever tenure, as already explained in treating of sub-tenancies, by simple intimation thereof to the landlord and irrespective of his consent. (See B. 2.)

Rent.

low paid.

1. Payment is made to the landlord, either by a fixed amount in money or in kind, or more frequently by share of the produce, according to the respective agreements.

low regulated.

2. Rents are regulated only by mutual convenience, without direct legal restrictions, although indirectly influenced by the several considerations adverted to under the following query; the customary agreements in other corresponding cases serving as a standard of comparison and dictating an approximate assimilation of terms.

/hen payable.

Rent is usually payable at produce-periods (whether in money or in kind), according to the nature of the property, as expressly defined in the several contracts, that is to say, July or September for cereals, October for grapes, January for oil, and so for other products, but not in casual instalments.

aising rent.

3. The landlord's power of raising the rent is counteracted,—

Firstly, by long leases at a fixed or proportionate rent;

Secondly, by the absence of active competition, the property being otherwise left on his hands; his recourse to eviction for non-payment of rent, breach of covenant, or other legal infraction involving such penalty, being restrained by the liability (afterwards explained) to pay for all improvements on the premises, and available only in cases of the grossest default. (See Evictions).

ecovery of rent.

4. The Ionian Law, irrespective of eventual eviction after three years, allowed the landlord to exercise the power of arrest for the recovery of rent; but that power having new been superseded, as inconsistent with Hellenic principles unless specially stipulated between the contracting parties (for which the law itself hitherto provided); provisional eviction, after the expiration of one year and two months' grace, has been substituted in lieu thereof; as more particularly set forth under the heading of "Evictions."

No cases, however, have yet occurred in illustration of this procedure, the law conceding this power having only been operative during the last twelve months.

The tenant, on the other hand, can experience no difficulty in enforcing, by due process of law, the payment of any compensation claims to which he may be entitled (see Improvements); and the vacating of the premises would doubtless be made contingent on such payment being effected.

Evictions.

ocedure.

1. The legal means of procedure by which a landlord can evict a contumacious tenant is by simple notice to quit, intimated to him through a Sheriff's Officer, which the tenant can oppose within three days by application to the Court of Primary Instance, subject to adjudication within eight days.

Should no such opposition be raised, or should the case be decided against the defendant, an order of eviction follows at the instance of the plaintiff, who is thereupon put in possession by the action of the Court.

The tenant has a right of appeal to the same Court if condemned in absence, and in such case the suit is inserted on the list to take its turn with others, unless precedence be conceded.

hen incurred.

In rural tenancies this liability is not incurred, save on the expiration of agreement, or non-payment of rent for three years; and in cases of provisional eviction under the new Hellenic Law (Article annexed)* the tenant is still allowed a considerable time to redeem, until the expiration of the full term as aforesaid (See Rent 4). It is also provided

ne allowed to eem.

* (Translation.)—Art. 80. If the portion-tenant, or lessee, or long leaseholder, or assignee, do not pay his annual or biennial portion, rent, or contribution, when due, after the expiration of two months, he is evicted from the occupation of the property until he pay his debt, or it be paid off; reserving to him his rights upon the property and produce.

The case is adjudicated in a summary way before the competent Primary Court, in accordance with the rules of civil procedure.

by another clause (Article 71) that the tenant may still redeem his holding up to the execution of the final judicial sentence, by paying to the plaintiff all arrears, with interest, together with the recognised legal expenses.

2. Evictions from rural property have seldom occurred here, the case being scarcely likely to arise while the earlier remedy of arrest was open to the landlord, who was held responsible for the maintenance of an indigent debtor on such occasions. Of rare occurrence

The raising of rent is not a proximate cause of eviction here, and can only be available on expiration of lease or after long continued default on the part of the tenant. But fixity of tenure has always been considered as the landlord's bane, involving interminable complications. Fixity of tenure.

Improvements.

1. All improvements, more especially in buildings, when held on short leases (parol agreements being limited to a term of three months), are usually executed by the landlord. In short leases.

In long leases, the duration of which can never be less than twenty years (B. 2), such improvements are executed by the tenant, with the right to compensation for the same in every case, as more fully explained under Query 4. A like title to compensation, under similar circumstances, is also applicable to improvements in cultivation, comprised by the law under the same category as the aforesaid. In long leases. Tenant's compensation.

2, 3. The tenant's security in this respect is founded upon the provisions of the law, which entitles him to recover in the ordinary way, with power to attach the property for increased value derived from cultivation (Article annexed).* His security.

4. The compensation due in such cases is defined and ascertained by appraisement, according to the following provisions of the new rural property law as aforesaid. How defined.

(Art. 56) The indemnities prescribed by Articles 53 and 54 (on separation of holdings, as already referred to in the accompanying general Report), consist in the appraised valuation of that portion of the recipient's property, appertaining, according to local usage, to the party to be indemnified. For the appraisement of the property, regard is to be had to its value at the time of appraisement, comprising also on the tenant's behalf the value of all requisite buildings erected by him connected with agriculture.

"Furthermore, those which are not requisite for this purpose in case the determination of the tenancy be sought by the landlord. On the other hand, the value of all contributions for which the property may be liable to him, is to be awarded on the landlord's behalf."

5. Tenants have no other means of obtaining loans for the improvement of their holdings than by having recourse to their landlords or private individuals on any terms, conditions, and security which may be mutually accepted; as adverted to under Queries 5 and 11. Tenants' loans.

Miscellaneous.

1. The relations between landlords and tenants were formerly of a friendly character. Relations between landlords and tenants.

The landlords were accustomed to a hearty reception in the rural districts, though usually residing in the town as habitual absentees from their property.

They were disposed to assist their tenants with pecuniary advances in seasons of distress, which the precarious resources of olive crops rendered of vital importance to many, as well as the requirements of agriculture.

Principles of conciliation and good faith were universally observed in all transactions between landlords and tenants; their prospects being intimately blended, more especially under the prevailing system of portion-tenure.

More recently, however, circumstances have changed, the tenant considering his landlord as an intolerable incubus which he would seek to shake off, and whose property he would aspire to usurp as a rightful inheritance or legitimate spoliation.

The landlord, on the other hand, could only regard his tenant in the light of an unscrupulous invader, a designing adversary actuated by lawless propensities, and setting at defiance all congenial influences under the inspiration of communism and social equality.

Many points of similarity and divergence may be detected here between these local dissensions and the several phases of the land question in Ireland to which contrast has

* (Translation.) On reversion the landlord returns to the long leaseholder, portion-tenant, or assignee, the increased value of the property derived from cultivation, reserving to the tenant the right of attaching the property.

been invited, "especially when the land is occupied by a tenant in consideration of such tenant paying a certain stipulated rent to the landlord," in order "to ascertain how far the laws and customs affecting such tenures in other countries differ from those existing in Ireland."

It may, therefore, be convenient to recapitulate here some of the salient points, even at the risk of tautology.

Notarial contracts. Here, instead of the vast majority of the occupiers of land holding by verbal agreement from year to year, the prevailing system is to hold by long leases, or perpetual assignments, or co-partnership, all under-written engagements as enjoined by law. (See Tenure, B, 2, 3.)

Evictions. Here, instead of liability to eviction being incurred on the expiration of annual periods, the law expressly provides that in all continuing tenures final eviction shall be postponed for three years; and although under the Ionian law the tenant was subject to arrest for non-payment of rent after the expiration of one year, this power having now been abrogated, provisional eviction only is incurred in such cases, after the lapse of one year and two months' grace, the tenant retaining the right to redeem within the three years aforesaid. (See Evictions.)

Improvements. Here, instead of tenants being "evicted without any compensation for their improvements," the law declares that on all such occasions, and under whatsoever circumstances the tenancy may determine, the increased value of the property, whether arising from buildings or cultivation, shall be duly appraised and compensated. (See Improvements.)

Rents. As regards "rents raised at the discretion of the landlord," various counteracting agencies have been already adverted to, whereby, independently of a long term of lease at a stipulated rent, the customary usage in such cases, although not specifically enjoined, constitutes the guiding principle on such occasions. (See Rent, 2.)

It should be added that amid all the differences which have occurred here, the amount of rent has never been brought under discussion, but only the means of recovery.

Agrarianism. Nor should some mention be omitted of another point of contrast here, agrarian crime being absolutely unknown in the one case while rampant in the other.

(Q. 2. What is the mode of cultivation by these tenants; and in what respect, as regards cultivation of their farms, employment of labour, mode and standard of living, solvency, independence, and general circumstances, and character, are they inferior or superior to the small proprietors?)—See reply B, 1.

(Q. 3. What is the annual rate of increase in the population among tenants as compared with that of small proprietors?)—See reply A, 12.

(Q. 4. Do these tenants or their children emigrate? If so, to what extent; and to what cause is such emigration attributed?)—There is no emigration of the agricultural classes from hence. (See A, 9.)

Public opinion. 5. The prevalent public opinion as to any of the special points adverted to under Class B, may be sectionally divided in conformity with the respective headings.

As to Tenure.

(1.) The perpetual sub-division of tenant-holdings, though retained under on management, is often very objectionable.

(2.) The nature of the tenure is of a complicated character, convenient to the non-resident landlord, but detrimental to him in other respects.

(3.) The system of notarial agreements is equitable and satisfactory. On the other hand the limitation of period in the case of parol agreements and lapsed leases, has a tendency to prevent continuing tenancies at will, as not available from year to year.

4. Registration being thus simultaneously effected, further trouble and expense are thereby avoided.

(5.) The tenant's right to remain in occupation of his holding for the space of three years without liability to eviction for non-payment of rent was only tolerable under the alternative pressure of arrest in the interim. The present substitute of provisional eviction has been adopted under proprietary suggestion as a palliative, and may be considered to have the desired effect of impressing the defaulter with the consequences of non-payment, and of thus vindicating the authority of the law, which he could only be tempted to despise from protracted delay, to the serious detriment of the landlord, and the encouragement of such default.

(6.) The right now conferred upon all tenants to alienate their interest in the holding without restrictions must prove highly detrimental to the landlord, and a fertile source of annoyance.

As to Rent.

(1.) No difficulties are experienced on either side as to the mode of payment in money or kind.

(2.) The terms are subject to no control beyond local usage, but the returns are calculated to afford a fair average profit to the holder; who, in long leases, is sufficiently guaranteed against occasional losses; and in portion tenure, only suffers proportionally, if at all, in common with the landlord. The payment of rent at produce periods is mutually convenient to landlord and tenant.

(3.) Although the landlord's unlimited power of raising the rent is only indirectly counteracted, no inconvenience has arisen therefrom. Moreover, any tenant dissatisfied with his agreement can throw it up whenever he pleases, by abstaining from paying the stipulated rent. On the other hand, the landlord's power of eviction is restricted to extreme cases.

(4.) Any legal means of procedure for the recovery of rent would be considered objectionable to tenants; but provisional eviction has been deemed less obnoxious to them than the previous power of arrest, which the landlords, however, considered more efficacious.

As to Evictions.

(1.) The legal means of eviction offers a reasonable opportunity to the tenant to substantiate his rights. The power to redeem, if provisionally evicted, is also in his favour.

(2.) Such evictions having been of rare occurrence, and limited to gross infractions, have not been stigmatized by public censure.

As to Improvements.

(1.) The tenant's means of executing improvements are small, and he has no facility for raising loans on advantageous terms.

(2.) The tenant's security for any such investments is amply provided for.

(3.) The landlord's responsibility for the same, when available to his benefit, has been recognized by Ionian and Hellenic Law as strictly equitable, under whatever circumstances the property may revert to the former, and has never been questioned here.

(4.) The legal definitions in this respect are precise and positive.

(5.) An Agrarian Bank has been considered a desideratum, as enabling tenants to avail themselves of the facilities conferred by law for purchase and redemption.

(6.) The creation of freeholds has been encouraged to some extent under the new rural property law, as already shown in the introductory Report upon land occupation; being rendered compulsory upon the landlord at the option of the tenant, or *vice versâ*. Creation of freeholds.

Encouragements of a similar tendency were also held out by the Ionian Legislature to the tenant-holders of ex-feudal property, by conditions of enfranchisemant available at any time to the latter at their discretion, as more fully explained under "copyhold."

The granting of leases in all tenancies has been expressly enjoined by the Ionian Civil Code (Articles 1521, 1630, and 1654), as applicable to the several descriptions of tenure already averted to. (See Tenure, 3.) Leases.

(7.) Hellenic Legislation has not deemed it essential to inquire very closely into the effects of such limitation of proprietary rights, in any of those measures wherein it has seen fit to exercise its prerogative. No compensation to proprietors.

This is aptly illustrated by the manner in which the Chamber, with the power concentrated in its own grasp, recklessly yielded to the instigation of the rural element, by cutting at the root of these proprietary titles, under circumstances of precipitation precluding the possibility of correctly appreciating the tendency of such crafty impetuosity.*

* These circumstances are thus narrated by Sir George Marcoran, then one of the Urban Representatives of Corfu:—

"J'étais présent à ces deux lectures et j'essayai en vain d'obtenir une prolongation du terme. Je quittai alors Athènes, car nous touchions à la fin de la Session, et je ne voyais dans l'adoption du Bill que les inconvénients déjà signalés, bien graves sans doute, mais pas insurmontables. Cependant, le lendemain, *à la troisième lecture*, on y inséra trois clauses nouvelles, convenues entre nos Députés de la campagne, quittant les rangs de l'Opposition pour se faire Ministériels. Par ces clauses, 1, on abolit, sans y rien substituer, les lois Ioniennes, sur l'estimation du fruit des oliviers, toute particulière à notre île; 2, on borna, avec effet rétroactif, la contrainte par corps aux cas prévus par la procédure Hellénique, qui exige le consentement contractuel du débiteur,—ce qui rendait dérisoire la limitation pour nos îles, où le moyen coërcitif était admis *de jure*, sans besoin de Convention spéciale; 3, on suspendit, jusqu'à la promulgation du nouveau Code Civil, qui est encore en état de conception, les lois Ioniennes relatives à la devolution des immeubles. Et à ces clauses, présentant des sujets tout-à-fait indépendants du projet originaire, on donna la qualification *d'additions*, pour voiler, si c'était possible, la flagrante

Public opinion to such concessions.

(8.) Public opinion as to the creation of freeholds at the option of the holders by the redemption of quit-rents, as now provided, can only be so far unfavourable, inasmuch as applicable to long leases (originally for a term of twenty years) where no such power existed before; or to perpetual assignments wherein an express condition to the contrary may have been inserted, as contemplated by the Ionian Civil Code; which otherwise conceded this privilege to the holders.* (Article annexed.)

The granting of leases however, as enjoined by law, applies to all tenancies of long or short duration.

Limited application.

(9.) The new system now in force here has an obvious tendency to increase the number of owners and freeholders; but is hardly likely to prove of extensive application, from the difficulty of raising funds for this purpose, notwithstanding the facilities of effecting such payments by instalments extending over a series of years.

No public aid.

(10.) No other assistance is provided in this respect; nor have the holders, established on allodialized fiefs, frequently exhibited the desire of endeavouring to become proprietors in their own right, during the long period which has elapsed since this privilege was conceded to them in 1827.

Dispersion of land.

(11.) The laws of descent and division in the Ionian Islands manifestly tend to favour the dispersion of land *ad infinitum*, which result has already been sufficiently exemplified under the first heading. (Article 1.)

Copyhold.

The duly tenure which may be considered as bearing an affinity of copyhold, is that connected with certain feudal baronies allodialized in 1825 (as already adverted to under the heading of Tenure, B, 5.); coupled with the condition that, in consideration of the benefits accruing to the feudatories from such unrestricted title of enfranchisement, as well as the renunciation of all Government tribute therefrom, the villeins of those fiefs should become entitled to special privileges and immunities as "contributors" of a rent-charge on the property, free from all reversionary penalties in the case of default or contravention of ancestral usage; not liable to arrest for non-payment of their quit rent or portion rent; nor subject to forfeiture or heriot by death or otherwise; the quondam feudatories having to look to the land alone for their customary dues. (Act No. 67 of 2nd Ionian Parliament, Article 14.)

By other Clauses of the same Act (Articles 10 to 13) the option of redeeming such rent-charge at any future period by freehold purchase on certain specified conditions, was also conferred, as already stated.

Thus such "concessionists" have acquired an indefeasible title of occupancy, which has been gradually approximating to a kind of copyhold tenure and which they can at any time convert into a freehold title.

The new rural property law is specially indulgent towards such ex-feudal contributors, the redeemable value as aforesaid being subject to further deductions† at the charge of the municipality, with the additional facility of effecting payment of such redemptions in ten annual instalments bearing 6 per cent. interest.

Had these tenants the means, as well as the advantage and encouragement they now possess, of purchasing on such easy terms the freehold title of their respective holdings, it would seem scarcely reasonable to doubt that, in the absence of other counteracting

violation de la Charte, d'après laquelle on aurait dû présenter des projets *ad hoc*, les faire imprimer, distribuer, insérer dans l'ordre du jour, et soumettre à la triple discussion. Mais le temps pressait, et la Chambre, écartant toute remarque et protestation contraire, admit d'emblée le projet, qui fut converti en loi.

"Si la simple énonciation ne suffisait à rendre évidents les iniques effets de ces trois clauses, sous le rapport de la garantie de la propriété, on pourrait noter qu'en 1867 on trouva indispensable de faire passer deux lois pour régler, quoique imparfaitement, l'estimation du fruit des oliviers, et l'exercice du droit de dévolution, qui était même admis en Grèce avant l'annexion. Ainsi, quant au sujet de ces deux lois, l'Ile de Corfou a été mise pendant deux années hors la loi."

* 1677. "Nella enfiteusi e nel livello di perpetua durata sarà permisso all'enfiteusa ed al livellario di affrancare il canone o la pensione, pagandone al padrone diretto il capitale corrispondente, che verrà calcolata alla ragione del sei per cento sul canone o sulla pensione, tranne il caso di una speciale convenzione in contrario."

(Translation) "In perpetual leases of rural or urban property, the lessee is at liberty to redeem the quit-rent by paying to the landlord the corresponding capital computed at the rate of 6 per cent. or such quit-rent, unless in the case of special convention to the contrary."

† Cependant la loi ΣΜΑ', après avoir adopté la conversion en valeurs numéraires des seules prestations féodales, ou cens, établies originairement en denrées, abrogeant sommairement toutes les redevances également légitimes; après avoir établi que cette conversion se ferait, avec la déduction (1) d'un quart sur le capital de la prestation ou du cens,—(2) des deux tiers de la taxe que le feudataire payait au Trésor, met à la charge du Gouvernement local, qui a déjà renoncé au droit d'hommage et à la taxe, l'indémnité qu'on trouve juste d'accorder, pour ces deux déductions, aux anciens feudataires. Enfin, les déductions faites, et la rente fixée en numéraire, cette rente peut être rachetée par le contributaire, s'il s'engage à en payer le capital calculé à 6 pour cent au propriétaire respectif, et cela en dix quoteparts annuelles.

influences, a large proportion of the ex-feudal copyholders would become proprietors in their own right, and conflicting tendencies thus bend to the authority of established facts.

But such a solution has hitherto been impeded by the conscious persuasion that, if other property were open to legalized expropriation, so much the more must these titles, considered as emanating from ancient usurpations and encroachments, be the first to be swept away by the invading torrent.

(Signed) SIDNEY SMITH SAUNDERS.

No. 7.

Mr. West to the Earl of Clarendon.—(*Received November* 20.)

My Lord, *Paris, November* 19, 1869.

IN obedience to the instructions contained in your Lordship's Circular despatch of the 26th of August last to Lord Lyons, and conveyed to me by his Excellency, I have the honour to transmit to your Lordship herewith a Report containing information in regard to the laws and customs affecting the tenure of land in France, embodied in answers to the paper of questions inclosed in that despatch.

I have, at the same time, the honour to inclose a list of the books, the purchase of which was necessary for the compilation of this Report, and which was authorized by your Lordship's despatch of the 6th September, and to state that these books will be forwarded by the first opportunity according to the instructions therein contained.

I have, &c.

(Signed) L. S. SACKVILLE WEST.

Inclosure 1 in No. 7.

Report on Tenure of Land in France.

Name of Country.—France.

Population.—France, according to the last census, contains a population of 38,067,094.

Religion.—The Roman Catholic religion is the recognized religion of the State, but the Protestant and Jewish forms of worship also receive State support.

There are 36,300,664 Roman Catholics, 1,591,250 Protestants, and 158,994 Jews. All other sects are tolerated.

LAND OCCUPATION.

(A.) The land is chiefly occupied by small proprietors, who form the great majority throughout the country.*

Property is generally divided into three classes:—

1. Properties averaging 600 acres, numbering about 50,000.
2. Properties of 60 acres, numbering about 2,500,000.
3. Properties of 6 acres, numbering about 5,000,000.

With some rare exceptions, all the great properties have been gradually broken up, and even the first and second classes are now fast merging into the third. To such an extent is this the case, that even at the present moment 75 per cent. of the agricultural labourers in many Departments are proprietors. The parcels of land held by them are oftentimes not more than a rood in extent, intersected by other holdings, and very often separated by considerable distances. This parcelling out of the land, although increasing every day, is to be found prevailing more especially in the Departments of the Côte d'Or, Haute Marne, and Haute Saône.

(B.) The land is also occupied by tenants holding from proprietors, and by "métayers," the nature of which occupation will be explained. But the tenants and metayers are, in many instances, small proprietors themselves, so that it may be said that small properties universally obtain.

(A.)—SMALL PROPRIETORS.

1. In order to give an idea of the distribution of property in the different Departments, I propose to state it as regards each separately:—

Dordogne.—Population, 502,673; area, 1,836,512 acres; cultivated land, 869,906

* See Tables 1 and 2.

acres; grass land, 147,930 acres. Properties of the 1st class, over 248 acres; of the 2nd class, 38 to 248 acres; of the 3rd class, under 38 acres. The first represent one-tenth; the second, four-tenths; and the third, five-tenths of the whole landed property.

Lot et Garonne.—Population, 327,962; area, 1,070,792 acres; cultivated land, 587,270 acres; grass land, 80,524 acres. Properties of the 1st class, over 124 acres; of the 2nd class, over 38 acres; of the 3rd class, under 38 acres. The first represent two-tenths; the second and third, eight-tenths of the whole landed property.

Gironde.—Population, 701,855; area, 1,860,876 acres (wood not included); cultivated land, 1,261,974 acres; grass land, 156,652 acres. Properties of the 1st class, 268 acres; of the 2nd class, 20 to 80 acres; of the third class, over 6 acres.

Orne.—Population, 414,618; area, 1,220,138 acres; cultivated land, 675,666 acres; grass land, 261,704 acres. Properties of the 1st class, 3 per cent.; of the 2nd class, 25 per cent.; of the 3rd class, 72 per cent. of the whole landed property.

Mayenne.—Population, 367,855; area, 1,034,114 acres; cultivated land, 708,160 acres; grass land, 145,970 acres. Properties of the 1st class, 240 acres; of the 2nd class, 40 acres; of the 3rd class, under 40 acres.

Sarthe.—Population, 463,619; area, 1,241,186 acres; cultivated land, 810,972 acres; grass land, 126,992 acres. Properties of the 1st class, 60 to 100 acres, form 2 per cent. of the whole; of the 2nd class, 30 to 60 acres, form 48 per cent. of the whole; of the 3rd class, under 30 acres, form 50 per cent. of the whole.

Maine et Loire.—Population, 532,325; area, 1,437,624 acres; cultivated land, 791,080 acres; grass land, 215,640 acres. Properties of the 1st class, 100 to 200 acres, form 2 per cent. of the whole; of the 2nd class, 40 to 100 acres, form 17 per cent. of the whole; of the 3rd class, under 10 acres, form 81 per cent. of the whole.

La Manche.—Population, 573,899; area, 1,187,552 acres; cultivated land, 760,830 acres; grass land, 188,112 acres. Properties of the 1st class, 80 acres; of the 2nd class, 24 to 80 acres; of the 3rd class, under 24 acres.

Calvados.—Population, 474,909; area, 1,104,144 acres; cultivated land, 626,276 acres; grass land, 240,626 acres. Properties of the 1st class, 100 acres; of the 2nd class, 40 to 100 acres; of the 3rd class, under 40 acres.

Eure.—Population, 394,467; area, 1,193,054 acres; cultivated land, 754,986 acres; grass land, 52,632 acres. Properties of the 1st class, 200 acres; of the 2nd class, 60 to 100 acres; of the 3rd class, under 60 acres.

Cher.—Population, 336,613; area, 1,365,418 acres; cultivated land, 818,078 acres; grass land, 148,626 acres. Properties of the 1st class, 160 acres; of the 2nd class, 40 to 160 acres; of the 3rd class, under 40 acres.

Indre et Loire.—Population, 325,193; area, 1,222,740 acres; cultivated land, one-fourth corn, one-fourth other grain, one-fourth grass land. Properties of the 1st class, 600 acres; of the 2nd class, 60 to 200 acres; of the 3rd class, 40 to 60 acres. There are in this Department small plots of two acres.

Loir et Cher.—Population, 275,757; area, 1,270,184 acres. Properties of the 1st class, 160 acres; of the 2nd class, 30 to 160 acres; of the 3rd class, under 30 acres.

Eure et Loir.—Population, 290,753; area, 1,174,860 acres; cultivated land, 953,910 acres; grass land, 35,206 acres. Properties of the 1st class, 200 acres; of the 2nd class, 40 to 200 acres; of the 3rd class, under 40 acres, respectively 3 per cent., 17 per cent., and 80 per cent. of the whole land.

Seine et Marne.—Population, 354,400; area, 1,140,000 acres; cultivated land, 818,750 acres; grass land, 62,198 acres. Properties of the 1st class, 200 acres; of the 2nd class, 40 to 200 acres; of the 3rd class, under 40 acres.

Seine et Oise.—Population, 533,727; area, 1,120,674 acres; cultivated land, 431,870 acres; grass meadows (natural), 38,008 acres; ditto (artificial), 116,798 acres. Properties of the 1st class, 300 acres; of the 2nd class, 160 acres; of the 3rd class, 40 acres.

Seine.—Population, 2,150,916; area, 95,100 acres; cultivated land, 58,564 acres; grass land, 3,086 acres. Properties of the 1st class, 100 acres; of the 2nd class, 20 to 100 acres; of the 3rd class, 2 to 20 acres.

Basses Alpes.—Population, 143,008; area, 1,390,838 acres. In this rocky and unproductive Department the holdings are generally from 30 to 40 acres.

Var and Alpes Maritimes.—Population (Var), 308,550; area (Var), 1,445,220 acres. Population (Alpes Maritimes), 198,818. Properties of the 1st class, 40 to 100 acres (properties of this class are rare); of the 2nd class, 10 to 40 acres; of the 3rd class, under 10 acres. The first two classes form four-tenths, and the third six-tenths of the whole land.

Doubs.—Population, 298,072; area, 1,045,510 acres; land cultivated, 200,448 acres,

of which 40 per cent. is grass. Properties of the 1st class, ½ per cent. of the whole land; of the 2nd class, 40 to 60 acres; of the 3rd class, 2 to 20 acres, forming seven-tenths of the whole.

Vosges.—Population, 418,998; area, 1,215,992 acres; cultivated land, 108,126 acres. Properties of the 1st class, 20 acres; of the 2nd class, 4 to 20 acres; of the 3rd class, under 1 acre, forming 73 per cent. of the whole landed property.

Haute Saône.—Population, 317,706; area, 1,067,984 acres; cultivated land, 323,618 acres, one-ninth of which is grass land. In the Arrondissement of Lure properties of the 1st class form ½ per cent., of the 2nd class 39 per cent., and of the 3rd class 60 per cent. of the whole landed property.

Basses Pyrénées.—Population, 435,486; area, 1,524,532 acres. Properties of the 1st class, 100 acres; of the 2nd class, 20 to 100 acres; of the 3rd class, under 20 acres.

Hautes Pyrénées.—Population, 240,252; area, 830,000 acres, of which one-fourth is arable land and one-ninth pasture. Properties of the 1st class, 80 acres; of the 2nd class, 20 to 80 acres; of the 3rd class, under 20 acres. The last class forms 94 per cent. of the whole landed property.

Landes.—Population, 306,693; area, 1,866,000 acres; cultivated land, 410,000 acres. Properties of the 1st class, 200 acres; of the 2nd class, 80 to 200 acres; of the 3rd class, under 80 acres.

Aisne.—Population, 565,025; area, 1,467,488 acres; cultivated land, 585,368 acres; grass land, 114,804. Properties of the 1st class, over 200 acres; of the 2nd class, 40 to 200 acres; of the 3rd class, under 40 acres.

Pas de Calais.—Population, 749,777; area, 1,321,126 acres; cultivated land, 711,707 acres; grass land, 206,012 acres. Properties of the 1st class, over 200 acres; of the 2nd class, 40 to 200 acres; of the 3rd class, under 40 acres.

Nord.—Population, 1,392,041; area, 1,136,074 acres; cultivated land, 625,034 acres; grass land, 180,808 acres.

Arrondissement of Lille.—Properties of the 1st class, over 20 acres; of the 2nd class, 6 to 20 acres; of the 3rd class, under 6 acres.

Arrondissement of Dunquerque.—Properties of the 1st class, over 100 acres; of the 2nd class, 26 to 100 acres; of the 3rd class, under 24 acres.

Arrondissement of Hazebrouck.—Properties of the 1st class, over 160 acres; of the 2nd class, 20 to 80 acres; of the 3rd class, under 20 acres.

Arrondissement of Avesnes.—Properties of the 1st class, over 100 acres; of the 2nd class, 40 to 100 acres; of the 3rd class, 10 to 40 acres.

Arrondissement of Cambrai.—Properties of the 1st class, over 200 acres; of the 2nd class, 160 to 200 acres; of the 3rd class, over 80 acres.

Arrondissement of Valenciennes.—Properties of the 1st class, over 200 acres; of the 2nd class, 30 to 200 acres; of the 3rd class, under 30 acres.

Somme.—Population, 572,640; area, 1,190,874 acres; cultivated land, 287,800 acres, (in the Arrondissement of Amiens). Properties of the 1st class, over 120 acres; of the 2nd class, 20 to 30 acres; of the 3rd class, under 20 acres.

Oise.—Population, 401,274; area, 1,058,984 acres; cultivated land, 824,700 acres; grass land, 56,414 acres. Properties of the 1st class, over 200 acres; of the 2nd class, 60 to 200 acres; of the 3rd class, under 60 acres.

Seine Inférieure.—Population, 792,768; area, 1,121,236 acres; cultivated land, 754,030 acres; grass land, 229,276 acres. Properties of the 1st class, over 100 acres; of the 2nd class, 20 to 100 acres; of the 3rd class, under 20 acres.

Morbihan. — Population, 501,084; area, 1,375,562 acres; cultivated land, 493,382 acres; grass land, 127,178 acres. Properties of the three classes vary considerably in this Department. The 3rd class prevails generally, and consists of from 2 to 40 acres.

Finistère.—Population, 662,845; area, 1,334,000 acres; cultivated land and grass-land, 1,000,000 acres. Properties vary in extent also in this Department. The average of the extent of the 1st class is, however, over 100 acres, and that of the 3rd class from 1 to 30 acres.

Côtes du Nord.—Population, 641,210; area, 1,375,200; cultivated land, 910,000 acres; grass land, 114,000 acres. Properties of the 1st class, 80 to 150 acres; of the 2nd class; 30 to 80 acres; of the 3rd class, 12 to 30 acres. This is the highest average.

Ille et Villaine.—Population, 592,609; area, 1,345,472 acres; cultivated land, 792,408 acres; grass land, 145,800 acres. Properties of the 1st class, over 200 acres; of the 2nd, 50 to 60 acres; of the 3rd class, 10 to 30 acres. This is the highest average.

Haute Marne.—Population, 259.096; area, 1,243,936 acres; cultivated land, nine-

tenths; grass land, one-tenth. Properties of the 1st class, over 60 acres; of the 2nd class, 20 to 60 acres; of the 3rd class, over 10 acres.

Côte d'Or.—Population, 382,762; area (total), 1,752,239 acres. Arrondissement of Dijon:—Cultivated land, about one-sixth; grass land, about one-third. Properties of the 1st class, 200 acres; of the 2nd class, 40 to 200 acres; of the 3rd class, under 40 acres. The other Arrondissements show much the same conditions of property.

Saône et Loire.—Population, 600,006; area, 1,712,000 acres. Arrondissement of Macon:—Cultivated land under crops, about 60 per cent.; grass land, 14 per cent. Properties of the 1st class, 40 acres; of the 2nd class, 10 to 20 acres; of the 3rd class, under 10 acres. The last class comprises 90 per cent. of the whole landed property. Arrondisement of Charolles:—In this Arrondissement properties may be found of from 300 acres and upwards.

Bas Rhin and Haut Rhin.—Population (Bas Rhin), 588,970; (Haut Rhin), 530,285; area (Bas Rhin), 910,690 acres; (Haut Rhin), 821,542 acres; cultivated land, 62·95 per cent. of the area of the Bas Rhin, and 64 per cent. of the area of the Haut Rhin.

There are in the Haut Rhin from 36,000 to 40,000 acres of pasturage. The arable culture and grass land form half the area of the two Departments—57 per cent. of the Bas Rhin, and 54·69 of the Haut Rhin. Properties of from 6 to 80 acres form a fifth of the area of the Haut Rhin. The remaining portion consists of properties of between 8 and 14 acres. In the Bas Rhin, property is also much divided. Properties of 8 acres form 70 per cent. of the whole area.

Meuse.—Population, 301,653. The statistical information respecting this Department is not so complete as that respecting others. Property, however, appears to be even more divided. Small properties are frequently under one acre in extent, and few exceed 10 acres.

Ardennes.—Population, 326,864; area, 1,046,578 acres; cultivated land (grass included), 1,032,210 acres; meadow land forms a sixth part of the land under culture. Properties of the 1st class, 100 acres; of the 2nd class, 40 to 100 acres; of the 3rd class, under 40 acres.

Moselle.—Population, 452,157; area, 940,724 acres; cultivated land, 612,036 acres; grass land, 94,404 acres. Properties of the 1st class, 120 acres; of the 2nd class, 30 to 120 acres; of the 3rd class, under 30 acres.

Meurthe.—Population, 428,387; area, 1,218,008 acres; cultivated corn land, 33 per cent.; grass land, 8 per cent. Properties of the 1st class, 140 acres; of the 2nd class, 30 to 140 acres; of the 3rd class, under 15 acres.

Loiret.—Population, 357,110; area, 1,354,238 acres.

Aude.—Population, 261,951; area, 1,200,278 acres.

Marne.—Population, 390,809; area, 1,636,088 acres.

Yonne.—Population, 372,589; area, 1,485,608 acres. Small properties prevail in each of the four last-named Departments. Detailed information is confused.

Indre.—Population, 277,864; area, 1,359,060 acres. In this Department large properties of several thousand are not uncommon.

Creuse.—Population, 274,057; area, 1,113,660 acres. Small properties form seven-tenths of the whole landed property.

Vienne.—Population, 324,527; area, 1,394,074 acres. Properties of the 1st class, under 800 acres; of the 2nd class, under 100 acres; of the 3rd class, under 20 acres; the last forming five-twentieths of the whole.

Allier.—Population, 376,164; area, 1,461,674 acres; arable land, 872,762 acres; grass land, 95,242 acres. Small properties under 4 acres prevail.

Puy de Dôme.—Population, 571,690; area, 1,590,102 acres; arable land, 754,460 acres; grass land, 391,356 acres. Property is very much divided. In the plains there are thousands of properties under an acre in extent.

Nièvre.—Population, 342,773; area, 1,363,312 acres; arable land, 641,814 acres; grass land. 182,180. Large properties prevail.

Hautes Alpes.—Population, 122,117; area, 1,117,922 acres; arable land, 194,000 acres; grass land, 480,000 acres. Properties of the 1st class, under 50 acres; of the 2nd class, 20 to 50 acres; of the 3rd class, under 10 acres.

Haute Savoie.—Area, 857,674 acres; corn land forms two-thirds of the land under cultivation; grass land, one-third, and natural pastures, one-sixth. Properties of the 1st class, under 80 acres; of the 2nd class, 16 to 80 acres; of the 3rd class, under 16 acres.

Savoie.—Population, 271,663; area, 1,182,000 acres; corn land, 122,600 acres; grass land, 40,000 acres. Properties of the 1st class, under 40 acres; of the 2nd class, 20 to 40 acres; of the 3rd class, under 20 acres.

Isère.—Population, 581,386 ; area, 1,657,868 acres; corn land, 443,400 acres; grass land, 130,000 acres. Population of the 1st class, under 60 acres; of the 2nd class, under 30 acres; of the 3rd class, under 10 acres.

Vaucluse.—Population, 266,091; area, 709,542 acres; corn land, 144,318 acres; grass land, 10 per cent. of the arable land. Properties of the 1st class, under 80 acres; of the 2nd class, from 6 to 80 acres; of the 3rd class, under 6 acres.

Drôme.—Population, 324,231 ; area, 1,304,310 acres. Small properties prevail.

Ardêche.—Population, 387,174; area, 1,105,330 acres. Properties of the 1st class are found chiefly in the high lands, and are from 30 to 40 acres in extent. Small properties prevail.

Gard.—Population, 429,747; area, 1,167,112 acres; arable land, 283,210 acres; grass land, 25,328 acres. Properties of the 1st class, under 100 acres; of the 2nd class, 10 to 50 acres; of the 3rd class, under 10 acres.

Hérault.—Population, 427,245; area, 1,239,600 acres; cultivated land, 602,594 acres; grass land, 73,546 acres. Small properties prevail.

Bouches du Rhône.—Population, 547,903; area, 1,020,974 acres; corn land, 222,996 acres; grass land, 17,144 acres. Properties of the 1st class, 200 acres; of the 2nd class, over 60 acres; of the 3rd class, under 60 acres.

Cantal.—Population, 237,994; area, 1,148,294 acres.

Haute Loire.—Population, 312,661; area, 992,450 acres.

Lozère.—Population, 137,263; area, 1,033,946 acres.

Corrèze.—Population, 310,843 ; area, 1,173,218 acres. In the four last named Departments the small proprietors prevail, but precise details are wanting.

Lot.—Population, 288,919; area, 1,042,348 acres. Properties of the 1st class, 30 to 120 acres; of the 2nd class, uncertain ; of the 3rd class, generally very small.

Aveyron.—Population, 400,070 ; area, 1,748,666 acres. Properties of the 1st class, under 180 acres; of the 2nd class, 50 to 180 acres; of the 3rd class, under 50 acres; or three-sixths of the whole landed property.

Tarn.—Population, 355,513 ; area, 1,148,432 acres. The 1st, 2nd, and 3rd classes bear the respective proportions of 10, 40, and 50 per cent. of the whole landed property.

There remain sixteen Departments, the distribution of property in which has not been ascertained. There is no reason, however, to suppose that, on an avarage, it varies much from the foregoing classification.

As a general rule, the smaller the properties the more liable they are to be intersected ; and where small plots of land prevail this is almost invariably the case.

2. *Articles 718 to 892 of the "Code Napoléon"* regulate the descent and division of landed property upon the death of the owner. As it would occupy too much space to give a full translation of these Articles in this place, I shall merely give a short analysis of the principal provisions of the law :—

Article 745 provides for the equal distribution of the property of the deceased among his children without distinction of age or sex. In default of children, the succession reverts to the brothers, sisters, and their children in portions defined by the law ; and in default of the collateral branches, to relations as far as the twelfth degree, where the law of succession stops (Article 748). Article 756 provides for natural children, and Article 767 for the wife (in case of no succession), and for the rights of the State.

A testator is not, however, obliged to leave his successors the whole of his fortune. He can, if he so wishes, bequeath to whomsoever he may appoint one-fourth if he has three children, one-third if he has two children or their descendants, and one-half if he has only one child. If he has relations on both the father's and the mother's side he cannot alienate more than one-third ; if on one side only, he can dispose of three-fourths (Articles 913, 919). An heir is at liberty to accept or decline a succession. This is determined in the case of acceptance or renunciation by Articles 774 to 792. Property is divided according to the provisions made by the law among all those claiming the right of succession (Articles 815 to 892). In fact these provisions, in all the details appertaining to succession, are so precise that a translation of each Article would be found necessary to explain minor points. I presume, however, that it is sought to obtain by these queries at once an idea of the law regulating the descent of the landed property, and it will be seen from the above that it starts upon the principle of its equal distribution, and it maintains this principle in all its provisions.

3. When the succession is established, the Notary (Notaire) proceeds to draw up all necessary acts. In the case of sale or exchange such acts must be duly witnessed, after having been signed by the contracting parties. In such cases a simple registration is not sufficient. The acts must be "authentiqués et notariés," and the originals must be deposited with the Notary. The succession duty varies according to degree from 1 to 9 per cent., and the legal charges average 1 per cent.

In cases of simple purchase the Notary prepares the necessary deeds, which are duly signed and attested by the parties interested. The registration fees amount to 5 per cent., and the legal charges to 1 to 2 per cent.; and they are paid by the purchaser unless it is stated otherwise in the contract of sale. The process is simple and expeditious, but, as may be imagined, the expenses are considerable, and doubtless very much impede the sale and transfer of land.

4. The facilities afforded for raising loans for purposes of agricultural improvements are not as great as are required. The "Crédit Agricole" is the only establishment which carries on operations of this kind to any extent. Since 1866 it has discounted to the amount of 40,000,000*l.*, and has advanced 2,480,000*l.* on agricultural produce and real property. Its commission varies from $\frac{1}{2}$ to 1 per cent., but the rate of interest depends upon the risk and uncertainty of the guarantees. It averages, however, from 5 to 6 per cent. But owing to the nature of these transactions, which are not as regular as commercial ones, the Bank of France, though not refusing, does not facilitate what is termed "papier agricole." There are banks and societies in some Departments, more or less in connection with the "Crédit Agricole," which carry on operations on a smaller scale, and from which the small proprietors derive great benefit.

Loans are raised generally for the purpose of purchasing contiguous plots of land. In some cases for the paying off in money the value of the portion of land accruing to co-heirs in order to avoid its division.

5. There is no very recent information respecting the amount to which rural property is mortgaged in France, but I find it is estimated that there is an annual average charge upon it of 6,000,000*l.*, or 10 per cent. on its net revenue, calculating the usual rate of interest at 6 per cent. What is termed the "régime hypothécaire" does not appear calculated to inspire confidence. The guarantees are not sufficient to induce mortgages on landed property. The small proprietor, therefore, has recourse to raising loans from local bankers on effects, which are discounted at 10 and even 15 per cent. The division of property, and the existence of a large number of small proprietors, are not conditions favourable to the system of mortgage prevailing in England and other countries, where large hereditary estates exist. On the subject of the mortgage debt M. de Lavergne says, "The last documents published set the amount of the registered debt at about 560,000,000*l.*, but this sum is reduced to 320,000,000*l.* pour tenir compte des doubles emplois." "Property ('propriétés foncières') being valued by the Finance Department at 3,200,000,000*l.* (80,000,000,000 francs) there would be an average debt of 10 per cent. This proportion," says M. Lavergne, "is less than in England, and it loses, moreover, some of its importance, since it is distributed over town and country property. The Department of the Seine is alone burdened with a tenth of the registered debt, and five-tenths at least must be put to other towns. Upon 1,200,000,000*l.* (30,000,000,000 francs) house property, the debt appears to amount to 220,000,000*l.* (5,500,000,000 francs), or 18 per cent.; and upon 2,000,000,000*l.* (or 50,000,000,000 francs) landed property, to 100,000,000*l.* or 2,500,000,000 francs, or 5 per cent.

6. The legal method of registering mortgages is very simple. In every Arrondissement a register is kept, in which all mortgages must be entered with full particulars. A Government functionary called "Conservateur des Hypothèques," superintends all matters relating to the registry. The register is public, and the "Conservateur" is obliged to furnish extracts, when required ("notices écrites"), to any one. The cost of registration for a mortgage averages from 25*s.* to 35*s.*, and a charge of 10*d.* a page is made for extracts. The "Conservateurs" are responsible for the correctness of extracts given.

7. Agricultural produce is classed as follows:*—1st, cereals and other alimentary produce: 2nd, industrial cultivation ("cultures industrielles"); 3rd, vines; 4th, fruit; 5th, pasture and cattle. Under the heads cereals and industrial cultivation are comprised every species of grain and vegetable crop, hemp, flax, hops, madder, beet-root, and other roots, tobacco, and the silk produce. It is only in the Departments where what is termed the "grande culture" exists, that any fixed rotation of cropping is adhered to. In such cases the system termed "assolement alterne" is generally followed, and is the most approved, but the biennial and triennial prevail in many districts. A succession of straw crops is of frequent occurrence. The small proprietor will, however, cultivate according to the locality, climate, and circumstances of his land occupation; and as these vary in almost every Department, no general rule can be laid down. Again, as regards the breeding and raising of stock, on small properties no precise information can be given, as their extent does not admit of it. Except on large farms, which are an exception, stock would rather embarrass than benefit the proprietor. He purchases, as occasion offers, what he requires from the cattle-breeding districts, and what his plot of land can support. On the other hand, in the Departments composed almost exclusively of pasture land, 1,500 cows may be

* See Tables 3, 4, and 5.

found upon 2,000 acres. A want of stock in proportion to the land under cultivation naturally prevails, therefore, in many districts, although the number of cattle has increased and is increasing.

8. The Agricultural Associations do all in their power to promote the employment of machinery in the cultivation of the land, and it appears that its use is becoming daily more common.* Threshing-machines are the most general. In 1856 there were 51,000; and since that period the number has greatly increased. Mowing- and reaping-machines are less common. In the Southern Departments machinery is little used. The nature of the cultivation does not admit of its employment. Great extension would be given to its general use if the duties were lowered or abolished. What is termed the hired labourer in England corresponds in France to the "valet de ferme," or farm servant. They live under the same roof, and eat with the master, and, in fact, form part of his family. They are, however, comparatively few in number. Their wages now average from 10*l.* to 12*l.* a-year for men, and from 5*l.* to 7*l.* for women, lodged and fed at a cost of about 10*l.* a-year per head. The day-labourer ("journalier") receives from 1*s.* to 2*s.* per day, and women from 6*d.* to 1*s.* They are fed at a cost of about 8*d.* a head per day. Female labour is much employed, more especially in the Northern Departments, and this would seem to be a natural consequence of small holdings. On an average, the wages of the female labourer are one-half those of the male. It is quite impossible to state the average number of labourers to an acre, but it is quite certain that agricultural labour is generally deficient throughout France. The migration of the country population to the great towns is daily increasing. This deficiency and the vast municipal improvements undertaken of late years have produced a rise of wages the towns which attracts the peasant, and thus increases the evil so far as land is concerned. The wages of the agricultural labourer, as distinguished from the farm servant, have, in consequence of this migration to the towns, increased considerably; and he can now earn on an average 2*s.* 6*d.* and 3*s.* per day—in some districts much more. It may be said that the wages of the day labourer have increased one-third, and those of the farm servants one-half within the last thirty years; the rate of increase varies considerably, but I should suppose that, on an average, it may be taken at one-half for the whole country.

9. The French agricultural labourer, or, it may be, small proprietor, does not emigrate to foreign countries. If he is a small proprietor, he will seldom move even from his native place. The agricultural population, as has been stated above, migrate to the great towns for the reasons assigned, but there is no tendency to emigration from France.

10. They will generally be found living on and cultivating their properties. Where the excessive division of the land is common, they will be found in villages or in habitations contiguous to one another.

11. Their condition of life depends very much, of course, upon the local circumstances of their tenure of land, the facility of communication, and consequent price of provisions.

It will be found as a general rule that the small proprietor accommodates himself to the circumstances of the locality which he inhabits, and that his standard of living is generally such as to show that he is, if not always contented, at least comfortable.

12. The average population of small proprietors to the acre can scarcely be fixed.†

There are, according to M. Lavergne, 500,000 farmers, 500,000 métayers, and 2,000,000 day-labourers and servants, most of them small proprietors, besides 2,000,000 of independent proprietors. He calculates that scarcely one-sixth are not proprietors. This population may be said to cultivate or live upon 50,000,000 acres of land. Its density must, however, vary to such extent that it is impossible to draw any conclusions from it. The annual average rate of increase of the population in France has been less than in any other State of Europe. Official statistics show that during a period of twenty-five years, 1836-61, the rural population has undergone a diminution of 1·18 per cent., while that of the towns has contantly increased. In 1846 the proportion of the rural population was 75·78 per cent. and that of the urban 24·22 per cent. In 1861 the proportion was, rural 71·14, and urban 28·26 per cent., and this ratio has not greatly varied since. The decrease in the number of children in the families of the peasantry is a fact fully established by the "Enquête Agricole," and it is generally remarked by those to whom questions on this subject were put, that there is a progressive tendency to diminution of fecundity in the families of the agricultural population. The labourer who has become a proprietor fears that his plot of land would be too much divided if he had a numerous family. He calculates, also, more than formerly the expenses which he must incur in bringing up his children, and the uncertainty (should he have them) of their

* See Table 6.

† See Table 7.

remaining with him when grown up, to assist him. Where families of seven or eight children were commonly to be met with in France, they now consist of two or three, or, perhaps, only one child. As compared with other countries, therefore, it may be said that the rural population of France is diminishing; for it is only when taken together with the urban population, that even a general rate of increase can at all be established.

13. The prevalent public opinion as to the advantages or disadvantages of the tenure of land by small proprietors is decidedly that it has been advantageous to the production of the soil, and has tended to the improvement of the material condition of the agricultural population. In the Report which accompanies the "Enquête Agricole," it is stated that "au point de vue de la production il est hors de doute que la diffusion de la propriété a été favorable. Le cultivateur qui cultive pour lui-même cultive mieux que le salarié pour celui qui le paye, et des soins plus assidus assurent des produits plus abondants;" and with respect to the condition of the cultivator, "Il résulte des recherches faites par les Commissions d'Enquête qu'aucun signe extérieur n'accuse de gêne plus grande que jadis chez les cultivateurs. Loin de là l'immense majorité des déposants a reconnu que toutes les conditions de la vie du cultivateur s'étaient améliorées universellement et dans une proportion notable. Logement, nourriture, vêtements, tout dans ses habitudes démontre un bien-être inconnu il y a trente ans." Again, M. de Lavergne says, "Les provinces même en 1788 les plus divisées étaient comme aujourd'hui les mieux cultivées, . . . et on peut dire en règle générale qu'avant comme après 1789, le progrès agricole a marché en France avec la division; pourvu," he adds, "qu'elle fût naturelle et volontaire:" for, he says (speaking of the forcible division), "elle serait plus sure d'elle-même, plus entreprenante, si elle n'avait pas subi un pareil choc."

There is another advantage attributed to the division of property and to the existence in a country of a number of small proprietors. It is said that such a condition of property conduces to political as well as social order, because the greater the number of proprietors, the greater is the guarantee for the respect of property, and the less likely are the masses to nourish revolutionary and subversive designs. The Report says on this subject, "On ne peut que se féliciter de ce resultat" (speaking of the increase of small proprietors); "c'est à la fois la preuve d'un immense bien-être, et un gage de sécurité pour la société." I have heard this argument strongly insisted upon.

On the other hand, it is distinctly stated in the Report as the opinion of nearly all those examined on the subject, that the tendency which seems everywhere manifest to an increasing division of the land is attended with decided disadvantages:—

"De l'excès du morcellement résultent des pertes de temps et de forces, des entraves au choix de l'assolement et à la liberté des cultures, des procès fréquents entre propriétaires contigus. Ce mal est très vivement senti, et cependant le morcellement, loin de s'arrêter, augmente chaque jour." Further, M. de Lavergne, in speaking of the increasing division in the Department of Lozère, says, "On est là bien près de l'idéal des philosophes égalitaires; les communistes eux-mêmes pourraient trouver la satisfaction de leurs théories, puisqu'un cinquième environ du sol est possédé en commun. Qu'en est-il résulté? Une indigence universelle." He is, however, not in favour of any change in the law of succession, which has undoubtedly led to the evil he complains of; for he says, "L'inconvénient réel dans la loi de succession est dans la division indéfinie des petites propriétés. Ici une modification de la loi est à peine nécessaire. Il suffit de l'usage, de la jurisprudence, et du bon sens pour atténuer beaucoup le mal." The conclusion, therefore, to be arrived at is, that the division of the land has been attended with great benefit, both as regards the production of the soil and the condition of the rural population; but that at the same time an unlimited partition of the small properties as they already exist would destroy this benefit, and be productive of serious evil.

(B.)—Tenants and Sub-Tenants under Landlords.

Tenure.

1. It is impossible to fix an average of the number of acres which a tenant, properly speaking, farms. In many cases he will be found to be a proprietor himself, who, having amassed a certain amount of capital, undertakes to farm ("exploiter") an adjoining property.

Generally speaking, the division of property naturally does not admit of large farms except in some of the purely agricultural departments, and then they partake more of the character of experimental farms. M. Chateauvieux (vol. i, p. 128), writing in 1846, estimates the number of acres farmed by tenant farmers at 16,940,000, against 70,000,000 cultivated by proprietors and "métayers."

2. The nature of the lease is laid down by Articles 1,763 to 1,788 of the Code Civil.

The extent of the lease varies from one year to thirty years, according to the quantity of land, the mode of cultivation, and the custom of the Department. The tenant has a right to sub-let his farm, unless the terms of his lease forbid it. (Article 1,717, Code Civil.) In the case of sub-letting the original tenant is responsible.

3. A lease can be made either by writing or by verbal agreement. (Article 1,714.) If there is no written contract the duration of the lease depends upon custom. If a dispute arises as to rent, arbitration is resorted to, and the tribunals decide. (Articles 1715, 1716.)

4. A written lease may be registered, but its registration is not compulsory. If the lease be not registered the tribunals will not take cognizance of it until it is registered in case of any dispute. The registration fee varies from $\frac{1}{4}$ to 1 per cent., and is calculated on the net amount accruing from the duration of the lease.

5. So long as the tenant pays his rent and fulfils the conditions of his lease the landlord cannot interfere with him. No law or custom can alter the contract. In the case, however, of what is termed "dommages par cas fortuits ou force majeure," he has the right to demand a reduction of rent. (Article 1769.)

6. The tenant has the right to sell his interest in his farm unless his lease forbids his so doing. Almost every lease, however, stipulates that he shall neither sub-let his farm or sell his interest in it without the consent of the landlord. (Article 1717.)

7. This kind of tenure is unknown in France. The Revolution of 1789 liberated the land by numerous enactments which abolished every species of tenure bearing such a character. With the exception of the "Impôt Foncier," which is voted annually in the Budget, there is no charge upon land, and fixed rents or services, which by custom might render a tenant irremovable are unknown.

Article 530 of the Code Civil provides even against fixed charges upon landed property arising from sale under certain conditions.

Rent.

1. Payment is made generally by a fixed amount in money. Payment in kind prevails in some Departments; this system is gradually disappearing. Payment by share of the produce constitutes what is called the "métairie" system. In the "Code Civil" the "métayer" is called "colon partiaire." He is a tenant who pays no rent in money, but gives to his proprietors a certain portion of the produce of the land which he farms. Formerly it was one half. In fact it is a system by which the proprietor gives his land, and the "métayer" his labour and the cultivation, for which, if either fail him, he can claim no compensation. The system is becoming less and less resorted to, and now obtains in only a few departments.

2. The amount of rent is entirely a matter of arrangement between the landlord and tenant. A farm may, however, be put up to competition as regards rent and the sale of produce. There is no law, custom or valuation, which regulates such transactions. The periods of the payment of rent vary according to custom and locality, but are generally agreed upon in the lease.

3. The landlord cannot break a lease nor alter the amount of rent as long as it is in force. The tribunals alone can order an eviction, or annul a lease on account of the non-fulfilment of its conditions. (Articles 1763 to 1778).

4. There is no special law which regulates the respective rights of landlords and tenants. They depend upon the "Droit Commun." If the tenant does not pay his rent the landlord can seize his effects, and the Tribunal annuls the lease. The landlord has privilege over all property belonging to the tenant in such case. (Article 2102.)

Evictions.

1. In the case of evictions there is no special procedure. The "Droit Commun" alone regulates the proceedings of the proprietor in such circumstances. When the tenant does not pay his rent, he is summoned by the proper authority to do so within twenty-four hours. If upon this payment is not made, the proprietor, if the lease is a verbal one, obtains an order from the Judge for the seizure of all the effects of the tenant, which are on as well as off the farm. If the lease is a written one, and in order, he can do this by virtue of it alone. The tenant can take advantage of any irregularities in the proceedings to gain time. Article 1244 empowers the Judge to use indulgence towards tenants whom he may consider to have been hardly dealt with, and to grant them time for the payment of their rent.

2. Evictions are rare. It is generally the interest of the landlord to be on good terms with his tenant, and there are in consequence very few lawsuits respecting leases. It is a constant practice among proprietors to advance money to their tenants.

Improvements.

1. The proprietor generally constructs all buildings, and must maintain the farm "clos et couvert." (Article 1719.)

2. If the tenant builds, he does so at his risk and peril. At the end of his lease he can remove such buildings, as he is only obliged to leave on the farm what he found on it.

3. The proprietor has no right to the buildings and improvements made by the tenant, who, in his turn, is bound to deliver up the farm in the same condition as he found it on entry. The relations between landlord and tenant are laid down by Articles 1763 to 1778. In practice, however, there is generally an understanding between them respecting improvements. For example, if the tenant wishes to drain, the landlord advances a certain sum, and the tenant pays 3 per cent. interest. The same system is adopted if new buildings are required.

4. It will thus be seen that there is scarcely question of enforcing or defining rights on either side, and the consequence is they very rarely become matter of contention. The simple reason for such a happy state of things is, that two-thirds of the land are cultivated by the proprietors themselves, and not by tenants.

Miscellaneous.

1. As will have been seen from the preceding answers the relations between landlord and tenant are generally amicable, and that legislative interference is seldom required between them.

The "Code Civil," in the matters of leases and rights of landlords and tenants, is so clear and distinct that no serious disputes can arise respecting them.

2. It must be borne in mind that the "tenant holdings," properly speaking, bear a small proportion to other tenures, and that the tenant farmer, as before said, is oftentimes himself a proprietor. The mode of cultivation, standard of living, and employment of labour, therefore, will not be found to differ much as a general rule. The tenant farmer may be said to possess this advantage over the small proprietor (but this is by no means always the case) namely, that he is assisted by the capital of his landlord if he is an intelligent and enterprising man.

3. As has been before said, the rural population generally is decreasing.

4. There is little or no emigration to foreign countries, but the great towns absorb the labouring population; and this, as regards agricultural labour, has the same effect.

5. The advantage of the tenant holding over the "metayer" system is universally acknowledged, and the one is gradually supplanting the other. The advantage to the soil and to the general condition of the agriculturist arising from small proprietorship has already been indicated. There are, however, disadvantages attendant upon it which ought not to be overlooked, but which are, perhaps, more the result of external circumstances than inherent in the system itself.

The small proprietor is ever anxious to increase his property. He is not content, however, to invest his savings exclusively in improvements and agricultural operations, but has recourse to investments in enterprises, which hold out the prospect of a speedy fortune. It is stated with regard to the Department of Calvados, that those who two or three years ago invested their savings in improving their properties, now seek to realize the 8 or 10 per cent. held out to them by the promoters of such enterprises. In one arrondissement alone, for example, there are held no less than 2,000 shares in the Seville and Cadiz Railway.

The possession of landed property even on a small scale, therefore, would seem to engender, under the present condition of the country, a desire for speculation on the part of the holder, which not only turns his savings from their legitimate employment, but in many cases produces embarrassment, and even ruin. Neither the small proprietor, the tenant, or even the day-labourer are free from this disastrous mania.

6. Except by the purchase of property there can be no creation of freeholds; and the creation of tenancies is the result of mutual understanding. There is no law or legislative enactment to enforce the granting of leases.

7. There is no limitation in the above sense to proprietary rights, which are clearly laid down in the Code Civil (Article 544), under definite conditions.

8. The division of the land which has been the result of the system now in force, as has before been remarked, is generally regarded as having been beneficial. It is not sought

to introduce any legislation which would apply to Questions Nos. 6 and 7. The system of equality in these matters is absolute.

9. The same remarks apply as regards this question. The Code Civil regulates the descent of landed property, and the Government take no measures either to encourage or discourage the application of its provisions to any particular cases or circumstances of tenure.

10. Tenants receive no assistance by law in their endeavours to become proprietors. They become proprietors almost from the nature of the system, which tends to the division of the land.

11. The Code Civil, as will have been seen, tends on principle to the dispersion of land; and not only to its dispersion but to the still further parcelling out of the already prevailing small properties.

(Signed) L. S. SACKVILLE WEST.

(No. 1.)—TABLE showing the Number of Proprietors, Farmers, Farm-servants, and Labourers.

Proprietors who farm their estates	56,639
Proprietors cultivating their own land	1,754,934
Proprietors cultivating their own land, and working on adjoining estates	1,987,186
Farmers (also proprietors)	648,836
Métayers (ditto)	293,860
Day labourers (ditto)	1,134,490
Non-proprietors:—	
Farmers	386,533
Métayers	201,527
Day labourers	869,254
Total	7,333,259*

* This number gives one agricultural labourer to every 14 acres.

(No. 2.)—TABLE showing the Per-centage of Proprietors not Cultivating their own Land, Proprietors Cultivating their own Land, and Cultivators not Proprietors.

	Per-centage.
Proprietors not cultivating	0·8
Proprietors cultivating	71·4
Cultivators not proprietors	27·7

(No. 3.)—TABLE showing the Number of Acres under Grain Crops, Total Value, and Proportion. (Statistics 1862.)

Crops.	No. of Acres.	Value.	Proportion.	
			Area.	Value.
		£		
Wheat	14,913,862	116,685,889	47·74	59·74
Oats	6,647,750	31,506,642	21·28	16·14
Rye	3,856,596	18,883,422	12·34	9·78
Barley	2,173,982	10,599,013	6·96	5·34
Maize, &c.	3,649,452	17,328,640	11·68	5·95
Total	31,241,642	195,003,600	100	96·95

(No. 4.)—TABLE showing the Extent, Value, and Proportion of the Potato and Chestnut Crops. (Statistics 1862.)

Crop.	Extent of Acres.	Value.	Proportion.
		£	
Potatoes	2,469,634	19,532,000	92
Chestnuts	1,073,402	1,772,000	80

The production of potatoes has increased 48 per cent. between the years 1840 and 1862.

(No. 5.)—TABLE showing the Division of the Soil. (Statistics 1855.)

Nature of Division.	Acres.	Proportion.
Arable land	51,256,626	48·5
Vineyards	4,203,392	3·7
Meadows	10,321,560	9·7
Pastures	18,418,138	17·8
Forests	17,971,940	16·8
Roads, rivers, &c.	3,886,132	3·5
Total	106,037,788*	100

* To this number of acres must be added the area of Savoy and the Department of the Maritime Alps, which comprises 2,423,576 acres.

TABLE showing the Number of Acres and Value of the State, Crown, and Communal Forests, 1866.

Designation.	No. of Acres.	Produce.
		£
State forests	1,982,124	1,600,456
Crown forests	134,664	119,896
Communal and private woods ..	15,953,964	8,580,000
Total	18,070,752	10,300,352

The extent of the forests of Savoy and the Maritime Alps is 388,000 acres. Forest land, therefore, occupies 17 per cent., or the sixteenth part of the area of France.

(No. 6.)—TABLE showing the Number of Agricultural Implements and Machines in France existing in the Year 1862.

Agricultural implements and machines:—	No.
Common ploughs	2,411,785
Other ploughs (not steam)	794,736
Scarifying implements	9,855
Cleansing ditto	37,884
Digging ditto	6,330
Hoes (horse)	25,846
Harrows	1,002,302
Sifting machines	35,939
Sowing ditto	10,853
Root-cutting ditto	27,958
Winnowing ditto	5,649
Mowing ditto	9,442
Reaping ditto	8,907
Threshing (steam) ditto	2,849
Common threshing ditto	97,884

It is calculated that upon an average, there are 64 winnowing machines and 106 mowing machines in each Department. The last are chiefly to be found in the Bas Rhin, Haute Savoie, Sâone et Loire, Hautes Pyrénées, Pas de Calais and Drôme. If the number of reaping machines were equally divided there would be 100 to each Department. The Bas Rhin possesses 3,760 Savoie, 1,078, and Aude, 8,918.

(No. 7.)—TABLE showing the Per-centage of the Agricultural Population for the Years 1851, 1856, and 1866.

Years.	Population.	Per-centage.
1851	21,922,000	0·62
1856	19,064,000	0·53
1861	19,873,000	0·53
1866	19,598,000	0·51

(A)—TABLE showing the Proportion of Live Stock to the Acreage under Cultivation and Number of Inhabitants.

Species.	Number of Head.	Number to Acreage.	Number to Inhabitants.
Cattle	12,733,188	23 to 200 acres	30 to 100 inhabitants.
Sheep	30,386,223	Not given	800 to 1,000 ditto.
Pigs	5,789,624	Not given	155 to 1,000 ditto.

Total number of horses, 3,312,232, of which 1,500,000 are employed in agriculture.

(B.)—Table showing the Amount of Live Stock in each Department of France.

Departments.	Cattle.	Sheep.	Goats.	Pigs.	Total.

As this Table is taken from M. Schnitzler's work "On the General Statistics of France," published in 1846, it cannot be taken as showing the exact quantity of live stock at present; but the variation has been inconsiderable, and as it is the most correct tabular form I have met with, I have adopted it, as giving the best general idea of its amounts.

Observations.

The general character of the information sought to be obtained by Her Majesty's Government with respect to land tenure in France, will be found set forth in the answers to the questions proposed on this subject. The system by which the tenure of land is regulated may be said, since its introduction, to have affected the character and social condition of the population more than it has been itself affected by them. It has been in fact the cause, and certainly the arbitrary cause of the change, for it sprang up, as it were, upon the ruins of a previous State, and was moulded into a system by military supremacy. It has formed the present social condition of the people by embodying all that was good and practical in the chaos of ideas which resulted from the great revolution, and by re-uniting the bonds of social life which had been torn assunder by this terrible collision of classes. Society was thus re-constituted. The old relations between landlord and tenant, and the remains of feudalism, were swept away. New relations had to be established; the land was suddenly emancipated, and henceforth, so to speak, the State constituted itself the landlord.

Purchase, lease, and inheritance, under these circumstances soon found a regulating power in the Executive Government, which based all its operations upon the principle of absolute equality in proprietorship, the great predominating idea of 1789. The tenure of land thus became its absolute possession,—possession acquired under fixed laws and conditions. No right but that of proprietorship was recognized. The effect of such legislation applied to land already declared free, was seen in an almost immediate re-distribution of property, a large portion of which necessarily fell into the hands of those to whom proprietorship had been hitherto unknown.

The effect also of the law of succession was soon apparent in the gradual division of the properties newly acquired, and a large class of small proprietors was thus created; a class to which may be attributed the agricultural progress of France so remarkable between the years 1815 and 1847,

The present relations between landlord and tenant in France, resemble those which exist in Ireland, in so far as they are founded on the express or implied contract of the parties, and not upon tenure or service; the verbal agreement from year to year exists, as well as the written contract, the conditions being established by law, and upon the strict fulfilment of which entirely depends the tenancy.

Eviction can be operated upon any contravention of the lease, and compensation for improvements depends upon agreement, and constitutes no legal claim upon the landlord.

From what has been said, therefore, it would almost seem that the Irish and French systems of land tenure were identic, and what has caused, in the one case, discontent and agrarian outrage, has, in the other, been productive of social order and general contentment.

But it must be borne in mind that 75 per cent. of the agricultural population in France are proprietors, and that the number of proprietors is still increasing. In this fact consists the difference,—a difference depending upon the ownership of the land by the masses, as opposed to the ownership of the land by minority.

Tenant right and fixity of tenure arising from land occupation are phrases scarcely heard in France in connection with landed property, for the simple reason that there can be no such right or fixity of tenure which does not result from free and undisputed possession, and as such possession appertains in the majority of cases more or less to the

tenant and labourer as well as to the landlord, the disputed questions which occupy attention as regards the Irish land question can scarcely ever arise in France.

Proprietary rights can never be called in question.

Whether a property consists of one acre or one hundred acres, the owner is absolute in all matters relating to possession. The Legislature cannot interfere between him and the tenant in questions respecting compensation for improvements or indemnities. The positive law of succession cannot be altered or modified by custom or usage, and the tribunals will only recognize such in cases of written agreement between the parties, and where the usage or custom does not contravene the Code. The only limitation, therefore, to proprietary rights consists in the law of succession, which prevents the owner of a property from disposing of it as he may choose; but so long as in actual possession and in the enjoyment of its proceeds, there is no law, custom, or usage which can constitute any claim or right on the part of a tenant or "métayer" holding under him.

The small proprietor is seen under more advantageous circumstances in France than in any other country in Europe, for he has, in fact, been the creation of a system which, whatever may be urged against it, has reconstituted the rural economy of the nation, and more than doubled the produce of the soil. His mode of life presents a striking and instructive illustration of the system, for it is based upon the proceeds of the land in which he has a direct personal interest, and he lives, therefore, as an independent member of society rising according to his means in the social scale.

The amount of capital expended by the small proprietor upon his land is proportionately small, but it must be borne in mind that the general fertility of the soil, the variety of its produce, and the little industries created by the "cultures industrielles," make up, in a great measure, for deficiencies in the mode of cultivation.

The condition, however, of the small proprietors varies very much in different Departments, as also does the mode of cultivation, but they will generally be found in easy circumstances, and living always in the hope of bettering them; and it is this hope which absolute possession engenders, that stimulates them to fresh exertions beneficial not only to themselves, but to the community in general.

I have already alluded to the disadvantages arising from the excessive "morcellement" of the land to which the present system of proprietorship in France is leading in many districts. All persons coversant with the subject appear to be unanimous as to its evil results, and it is becoming an important question as to how far it may be possible to preserve a system which has been productive of such undoubted benefit to the nation, and at the same time prevent its undue development from becoming the cause of ruin and misery.

(Signed) L. S. SACKVILLE WEST.

LIST of Books, the purchase of which was authorized by Lord Clarendon's No. 842 of September 6, 1869.

1. "Enquête Agricole," 28 vols.
2. "Economie Rurale de la France" (Lavergne), 1 vol.
3. "Statistique Générale de la France" (J. H. Schnitzler), 4 vols., 1846.
4. "Population de l'Empire" (pamphlet).

No. 8.

Mr. Gordon to the Earl of Clarendon.—(Received November 30.)

My Lord, *Stuttgardt, November* 20, 1869.

IN compliance with your Lordship's Circular despatch of August 26 (received August 30), I did not delay to instruct Mr. Baillie, First Secretary to this Legation, and resident as Chargé d'Affaires at Carlsruhe, and Mr. Phipps, Second Secretary to the same and acting as First Secretary at Stuttgardt, to occupy themselves immediately with the study of the various points bearing on the subject of land tenure as regards this kingdom and the Grand Duchy of Baden respectively, which are adverted to in your Lordship's despatch, and to report upon the series of questions included therein, of both which documents I furnished those gentlemen with copies as instructed by your Lordship.

I have now the honour to transmit herewith a letter and report which have been drawn up by Mr. Phipps on the above subjects as regards the Kingdom of Wurtemberg, and in doing so, I feel called upon to express my opinion of the diligence and ability evinced by him in composing the latter, which is full of interesting information on the points in question, with reference to their different aspects in this country in very laudably strict adherence to the line of inquiry indicated in your Lordship's despatch and its inclosure; although it may, perhaps, be objected that he has scarcely paid sufficient attention to the contrast which it is apparently desired by your Lordship should, in these Reports be drawn between Wurtemberg and Irish Institutions, customs and systems on the matter in hand. To this, however, it may, I venture to submit, be very fairly replied that such a contrast presupposes a considerable practical knowledge of Ireland and the land tenure system there which is not possessed by every one and which, as Mr. Phipps has not lived in that country, he cannot be expected to have.

I beg leave to advert likewise to another difficulty in drawing up such Reports as are desired by your Lordship if they are to be furnished within a short space of time. Many of the Queries (as, for instance, Query 13, Division A, and Queries 5 and 8 Division B, heading "Miscellaneous") relate to the directions of public opinion on the existing practice or system in foreign countries, respecting which information is sought for. Now it may be comparatively easy to obtain such information as to the actual facts referred to within a limited time, whereas it would manifestly require a much longer interval and much more extended opportunities of studying the subject, probably quite new to the reporter when proposed to his attention, in order to give any reliable and well-digested information as to the state of public opinion in the country in question respecting that system. I take the liberty of appealing to the latter consideration especially in requesting your Lordship's indulgence for the delay which must still take place before Mr. Baillie is prepared to send in his Report as to the Grand Duchy of Baden. He is, I know, engaged diligently in making the necessary studies for it, but finds it, as he informs me, very difficult to obtain the information (of which, however, he has received the promise) which he requires in order to reply intelligently to several of the questions proposed in the inclosure to your Lordship's despatch.

Lastly, I beg to remark that, in consequence of the very exceptional cases, both in Wurtemberg and Baden, of the land being in possession of large proprietors and by them farmed out to tenants, very few of the Queries and considerations proposed under Division B in the inclosure of your Lordship's despatch are applicable to these countries, and cannot, therefore, be answered so as to afford much information of the description required by Her Majesty's Government.

As regards myself, and the expression of the gratification it would afford to Her Majesty's Government to receive any additional information which may be supplied by the Chiefs of Her Majesty's Embassies and Legations abroad on the subject in hand, I cannot pretend to have paid the attention to it which would qualify me to add much to the information furnished by Mr. Phipps. But I have, of course, not neglected the subject, and in the few remarks I take the liberty of offering, such as they are, it may be convenient to follow the order adopted in Mr. Phipp's Report, on certain parts of which I am induced to make either supplementary remarks, or even partial restrictions.

1. Under the preliminary heading "Land Occupation," Mr. Phipp's Report gives a theory for the existence and number of the small proprietors in this country which will, I venture to think, be entirely new, but which, Mr. Phipps informs me, he has derived from conversation with, and positive information furnished by Dr. Becker, an eminent legal practitioner and Member of the Chamber of Deputies, of the popular or anti-Prussian party, and Member, in 1848, of the German Regency for Wurtemberg.

Mr. Phipps, following Dr. Becker's inspiration, argues that the soil was originally in the actual ownership of the so-called peasant (*Germanice*, "Bauer," literally, cultivator or inhabitant), although his proprietorship was variously and tyrannically restricted by the interference and violence of the feudal Lords; whereas the almost universal theory is, I presume, that the land belonged actually to the Sovereign, whoever he might be, powerful or not, and whatever might be the extent of his territory, for portions of which his greater feudatories did him homage and service of various descriptions; whilst they, on their part, made over or let out portions of their districts to inferior Lords or Barons, who similarly each assigned portions to inferiors on like conditions, and so on till the mere labourer received his plot of ground for rent, whether in kind, service, or money, as I can recollect was frequently the case in Aberdeenshire so recently as some forty or fifty years ago.

The question is interesting, and I am not in a position to solve it.

2. In much that Mr. Phipps says in reply to Query 9 under Division A, heading, "Small Properties," with regard to emigration, your Lordship will perceive, that the

information which he has independently gathered, tallies with what I had the honour to write to your Lordship in my despatch of the 31st August, as to the new Military Regulations since 1866, producing increased emigration of young people in order to escape their operation. Baron Varnbüler has likewise since quite incidentally confirmed this opinion and, I may add here (as connected with the subject, and because I have received an application from certain Liverpool emigration agents, to obtain the support of the Wurtemberg Government to their firm), that his Excellency is himself personally (and he informed me that it was likewise the policy of this Government), determined to oppose emigration, in so far as to offer no facilities for it, and on the contrary, to throw in its way all the difficulties in their power. I beg to add that I replied to the above application, that without instructions from your Lordship I could not comply with its request, nor interfere in any way in the matter.

3. In answer to Query 10, Mr. Phipps states, that the small proprietors of this country almost invariably live in villages or small towns, a custom which occasions considerable inconvenience.

I should be inclined to say that the practice is quite invariable, and I can, from the able testimony of Herr von Steinbeis, President of the Board of Trade, fully confirm the above opinion of the inconvenience of the practice. It is, of course, impossible that the whole of the plots of ground belonging to the inhabitants of a village or town, and these communities number variously from 400 or 500 to 1,000 or 2,000 or more inhabitants, should lie near the place itself, so that the time occupied in going the distance between the dwelling-house and the field and the necessity of carrying or driving thither or thence all tools, seed, manure, &c., is often a very serious waste of time, inconvenience, and injury, besides preventing frequently the cultivation of tender or valuable crops, from the impossibility of properly watching them, or of sufficiently guarding them against depredation. But the system is ancient, having been adopted in troubled epochs for the sake of mutual protection, and having been and still being fostered by the Government for bureaucratic and police purposes,—as Herr von Steinbies argues—very erroneously and vexatiously.

4. With regard to Mr. Phipps' interesting reply to Query 13, I am inclined to differ with him as to the beneficial effects, in view of the subdivision of property, which he attributes to the restrictive marriage laws hitherto enforced by the communal system and general law of Wurtemberg, as well as, I may add, of Baden and other German States.

The hardship and impolicy of these laws has latterly been understood in both the States just named; and, whilst in the latter, a law for the compulsory introduction of civil-marriages, including much simplification and alleviation of the present Marriage Laws is at this time passing through the Legislature (respecting which Mr. Baillie will report when it becomes law) in this country, a similar measure has been, for some time, under the consideration of the Government, and will be submitted to the Chambers at their next Session, with every probability of receiving their sanction.

5. With regard to the state of public opinion, as to the advantages or disadvantages of small proprietorships, I am inclined, from such inquiries as I have made, to agree with Mr. Phipps, that the former are generally considered as prevailing over the latter. As one influential authority in this direction, I may instance Baron Varnbüler, who is himself a considerable landed proprietor for this country; but who justifies his opinions on the point (which he also printed in 1846), by saying, that admitting the system of subdivision of property to occasion increased expense in cultivation, it renders, notwithstanding, the land absolutely more productive, inasmuch as the small proprietor works his piece of ground more with a will than he would do as a tenant or labourer, tends it more carefully, works early and late at hours he would never do under another system; and finally takes a higher and better position as a member of society, and feels himself, as owner of his acre or two of land, or less, a more important individual,—as weighing more in the body politic,—than he would do for instance as holding to his name in the savings bank several hundred or more of florins that he might otherwise have laid by from hired labour or industrial pursuits.

I think it may prove interesting to add the following translation of the passage by which Baron Varnbüler sums up his remarks on this subject in the pamphlet to which I have referred:—

"Any one who has had opportunities of intercourse with the people, will recollect how, among the poorer classes, industry, good faith, economy, moral behaviour, are accustomed to attach themselves to the acquisition of a small property; how the house servant, or farm labourer, or small mechanic, usually doubles all his efforts, from the moment when he has obtained the right of calling a small plot of land his own; as also how he seems to place all his happiness in maintaining, extending, and tending this

possession, and how incredibly large are the returns which, in addition to his other labour, he is enabled to extract therefrom. Let it not be forgotten either, that all these small proprietors are bound to the course of order by this, it is true, absolutely small but relatively large pledge. Finally, let those parts of Wurtemberg, where the subdivision of land is greatest, be examined on the spot, in order to convince the inquirer of the high degree of productiveness to which the ground is brought in those quarters, and for what a mass of wants it is made there to suffice before he even thinks of disturbing this source of industry."

With all this, however, Baron Varnbüler guards himself carefully against being supposed to advocate the subdivision of property abstractedly, or to condemn large properties. His pamphlet, from which the above is extracted, is on the necessity of further legislation for the furtherance of industry in general; and he would be understood only to contend that the subdivision and power of further and continued subdivision of property is even, with its acknowledged disadvantages, at present the smaller, and indeed a necessary evil; at all events a less one than their legal restriction would be, and that the natural corrective for it lies in the development of industrial activity.

"There," he concludes, "where large properties are sanctioned by custom and peculiar conditions of private law ('privat rechtlich') I would by no means interfere with it. There lies in every ancient custom some truth, and therefore do I consider it as a bounden duty in legislature to oppose the many abuses by which the same may in any possible manner be attacked."

6. I beg, in conclusion, to advert shortly to the very large proportion of forest land, amounting, as it would appear from the Appendix to Mr. Phipps' Report, to nearly one-third of the whole productive area of this kingdom. Of the 2,000,000, speaking roughly, of Wurtemberg "morgen" or acres of forest land in the country, one-third is in the hands of the Government, one-third in possession of private proprietors, and the remaining third in the occupation of foundations for pious and useful purposes, and of corporations, communal or oppidan. Again, of the above third possessed by private persons, one-half is in the hands of large proprietors, and the other of small proprietors. Of these the latter portion is diminishing yearly by sale, the greater part being purchased by Government, which, from economical and prudential motives, constantly seeks to increase the forest land belonging to the State. The chief of these motives are, that as coal is not found in Wurtemberg, it is requisite to take every step possible for taking care that there should be a sufficient supply of fuel; and further, that the climatic conditions of the country should not be prejudiced by too extensive a denudation of the acreage under forest. There exist, besides other economical reasons, connected with forest management, which render it advisable for the State to acquire as much of such property as possible.

I have, &c.
(Signed) G. J. R. GORDON.

P.S. *November* 26.—The whole question of forest management, to direct which, in all South German States constitutes almost a distinct Department of the State, would require a Report devoted entirely to this subject, and has a body of laws exclusively applying to it. From the immense extent of ground in these States that is under forest, the economical necessities produced by the absence of coal, and the climatic considerations involved in the maintenance of the requisite quantity of forest land, the subject is one of the first importance; and having therefore for many years commanded constant attention, the management of the forest lands in all the South German States has been brought to a high degree of perfection.

G. J. R. G.

Inclosure in No. 8.

Report on the Laws and Customs affecting the Tenure of Land in the Kingdom of Wurtemberg.

Stuttgardt, November 20, 1869.

Name of Country.—The Kingdom of Wurtemberg extends over an area of 6,188,252 acres (German morgen).

Population.—It has a population, cacording to the census of 1867, of 1,899,906 inhabitants. Over 4,000,000 acres* are cultivated, or 65 per cent. of the whole amount,

* 1¼ morgen (German acre) = 1 statute acre.

while the forest, one of the principal sources of wealth, extend over an area of nearly 2,000,000 acres, or nearly 30 per cent. of the whole.

An estimate of the density of the population gives 1 inhabitant to every 3½ acres, or 1 inhabitant to 2⅓ acres of cultivated land, and 26 per cent. of the whole population are said to be inhabitants of the 136 towns which the Kingdom contains, in all about 460,000 persons, while about 50 per cent. of the whole population are said to be occupied in agricultural pursuits.

The male population of Wurtemberg in 1861 consisted of 830,192 persons, of whom nearly 600,000 were over 14 years old.

The increase of the population is, comparatively with other countries in Germany, very small; for while, during the last 50 years, the population of the whole of Germany increased at the rate of 50 per cent. the increase in Wurtemberg was only at the rate of 23 per cent. A comparison of Wurtemberg with other German Kingdoms of similar size, places it again in an unfavourable position in this respect, for the increase in the same period in Saxony amounted to 85 per cent., and in the late Kingdom of Hanover to 45 per cent.

Religions.—The three religions sanctioned and recognized by the State are, the Lutheran, of which the King is the head; the Roman Catholic; and the Jewish; but all other sects are tolerated. The number of Evangelic or Lutherans is 1,220,124; of Catholics, 543,593; and of Jews, 11,662. There is an inconsiderable number of persons belonging to other sects, such as Baptists, Unitarians, Jerusalemites, Methodists, and Calvanists.

Industrial Pursuits.—Agriculture is the principal occupation of the mass of the population, and cattle-breeding on a moderate scale. There are numerous small manufactories of linen, cotton, hosiery, woollen cloths, cutlery, tobacco, glass-toys, &c. There are two extensive mills for spinning cotton and woollen yarn, and four beetroot-sugar manufactories on a large scale. Salt was a State monopoly until last year, when its production was thrown open by the Zollverein; it is produced in large quantities; and there is a very important State iron foundry, which produces yearly 3,000,000 florins worth of iron. This is still a Government monopoly.

It is, however, intended in the next Session of the Legislature to abolish the State monopoly of the iron foundry, which for a long time since has not paid the expenses of working. As a rule, the impulse given by the State to all industrial undertakings has been carried too far for the requirements of the population, and Government assistance has been afforded to a mass of industrial occupations (as well as to provide technical instruction on the same), which do not in many cases repay the outlay invested on them. The primary expenses of such undertakings are generally, when managed by the Government, excessive; for instance, all the buildings at the iron-foundry at Wasseralfingen are on a palatial scale; whereas, a company or a private ironmaster, would have erected, at a far inferior cost, the buildings absolutely necessary. The breeding establishments (Landesgestül), moreover, are maintained by the State at an enormous cost, little compensated for by any improvement in the breed of horses. All these, and similar abuses, are probably connected with a bureaucratic system, and as all these Government undertakings afford occupation to a large quantity of minor officials, the cessation of their management by the State would meet with considerable opposition by a large portion of the community. Had the public money which, it is considered on many sides, has been wasted in this manner, been left in the pockets of the tax-payers the various branches of industry, where desirable, would probably have attained even greater vitality. There is a considerable party in the country which argues that an important diminution might be made in the taxation, by at least a modification of the policy of the Administration in this respect.

Land Occupation.

The system of land occupation in Wurtemberg is now almost entirely by small proprietors, by whom nearly the whole land is held. The few tenant farmers in the country are upon the State or Royal properties, or those belonging to the wealthier of the nobility or mediatized Princes, but farms held by such tenants are seldom less than 200 acres in extent, and, as is subsequently mentioned, are almost always men of a very superior class, who practice high farming, and have undergone a practical and theoretical agricultural education at the Royal Agricultural College at Whenheim. Until the year 1817, however, the greater part of the agricultural area was cultivated by a class of men who, though termed proprietors, held a position in many respects similar to that of the tenant farmers in Ireland, with the exception that, in general, they enjoyed a life tenure

of their land, renewable by one of the sons on payment of a certain due or premium, and the process by which these have been converted in one generation into the now comparatively prosperous days of small independent farmers is one of considerable interest, and though that independence has been ever since the year 1848 complete, the last traces of the feudal rights which for so long interfered with the freedom of proprietorship in Wurtemberg will, in 1873, entirely disappear by the payment of the last instalment of the sums due for the freedom of the soil.

In the middle ages the proprietorship of the peasant in the soil which he cultivated, was, in the whole of Germany, as well as in this country, restricted by various feudal rights, partly of the nature of taxes and partly of personal bondage and obligation to serve on certain occasions his feudal lord. The origin of these imposts cannot be traced with any precision, having existed in most cases before any system of registry of titles, obligations, or mortgages was established. The peasants may have been permitted by the petty Princes and nobles to cultivate the land and earn a bare livelihood under these restrictions, or else in those days owing to the insecurity of property and the prevalence of lawlessness the land which was possibly originally the property of the peasant was, so to speak, made over by him to the nobles or the Church and monasteries in order to obtain protection from them against others, and thus identify his interests with their own. They, on the other hand, permitted him to remain in possession of and cultivate his land, and in return for the immunity and security which he enjoyed, imposed upon him a series of overwhelming obligations. In fact, on the division of properties so encumbered the persons acquiring land took upon themselves the burdens upon the property, and thus the number of, so to speak, serfs largely increased. These imposts adhered not only to the land itself but to the buildings on it and their occupiers, free and unrestricted proprietorships was the exception, and inasmuch as imposts of the most varied description, and in favour of various feudal lords rested on one and the same patch of land, hardly any clear profit to the tenant or occupier remained when the different seignorial dues, such as taxes in money or in kind, ground taxes, tithes, third or fourth amount of raw products of the land, had been paid.

This species of land tax in most districts formed the principal source of revenue of the petty princes and barons, as well as of the cloisters, churches, parishes, and charitable institutions, and even of private individuals and patrician families in the large towns. The multiplicity of their nature and their division into small amounts made the very collection and levying of them a burden alike to the recipient and the obligee : to the latter especially they formed a constant obstacle to any sort of agricultural progress, inasmuch as any improvement in the resources or productiveness of the soil obtained by the toil of, or as a result of the improvements made by the so-called proprietor or rather tenant, was comparatively less advantageous to him than to his feudal landlord, who still "feloniously" claimed as his due the same percentage of the raw produce without having any regard to the increased expenses of the cultivator. Besides this, there was a series of legal restrictions on the free use and cultivation of the land, such as the obligation to grind the corn or press the grapes in certain places at certain periods, limitations as to the ploughing of certain fallows, and the cultivation of certain sorts of corn and fruit, as well as fixed periods for harvest and vintage, which were closely allied with the feudal dues above alluded to.

Although it was recognized that the interests of agriculture would suffer most severely were the system kept up, the feudal proprietors were so unwilling to tolerate the modification of private rights even though in obedience to the demands of public interest that during the first years of the present century they resisted so powerfully that no improvement could be made, and although after the accession of the late King a Royal Edict was in 1817 promulgated by which the obligation of personal servitude was declared to be at an end, and the redemption of many feudal rights provided for as well as the unlimited laws of socage (a sort of personal service) modified, the feudal proprietors appealed to the Diet at Frankfort for reinstatement in their rights. In the State and Royal properties, however, the Royal Edict became law, and these dues were either altogether suppressed or else made redeemable under favourable conditions.

The evil results attending the unrestricted feudal rights became at last so palpable, that in 1833 a project of law was brought in to release the country from the most exorbitant of them ; but it was not until 1836 that a system insuring the freedom of proprietorship in the soil was made law, and not till 1848 that all the feudal rights were completely abolished, the feudal proprietors being indemnified, in some cases not at all, and in other cases by twenty to twenty-two and a-half years' purchase, according to the nature of the dues redeemed. The peasant proprietors had, however, only ten to sixteen years' purchase to pay for their release, the difference amounting to 2,600,000 florins

(nearly 220,000*l.*), being made up by the State; and the sum for which they were liable was made payable in terminable annuities of equal amount, extending over a period of twenty-five years.

The law provided that the whole amount could be payable at once, or that the farms might, on payment of the whole amount become free at any time during the twenty-five years. This course was on the occasion of changes of proprietorship often followed, so that a considerable portion of the land is already entirely free.

After this law was carried out, the nobility represented that, while losing the profits accruing to them from the feudal rights, they were still compelled to bear the obligations attendant on them, such as the construction and repair of roads, bridges, churches, schools, and glebe-houses, whereupon after protracted discussions the redemption of these obligations and the indemnification of the tithe owners was carried out upon the same system as the redemption of the feudal dues.

In 1852 and even as late as 1860 the former owners of the tithe and seignorial dues endeavoured to re-open the question, and represented that their losses had been, in many cases, enormous, and that great injustice had been done to them; but they met with the most strenuous opposition in the Chambers and the country, and it was finally decided that the system of redemption of these dues had been carried too far for any alteration to be possible; and there is little doubt that the settlement of this difficult question was made on a footing most equitable to all classes.

Thus were all restrictions on the freedom of property abolished, and all subjects of animosity between the noble and the peasant rendered impossible. The peasant was a gainer in that the profits of his tillage were henceforward for his own benefit, not that of others; the noble was no sensible sufferer, inasmuch as he was insured the regular payment of the release fund, and he became thus the owner of a large amount of property of marketable value at a moment when a considerable quantity of land came into the market, of which he could become its purchaser far below the value, and at the same time had no longer before him any apprehension of any new agrarian revolutions or land questions.

The State was at the same time, in spite of the sacrifices it made, a great gainer, owing to the peasant being placed in a position relatively so much more favourable, that his ability to contribute to the Government in the way of taxation was increased. At the same time the result has been that the cultivated area of the kingdom has increased to a very considerable extent, and a great impulse was given not only to agriculture but to trade and commerce of every description.

(A.)—Small Proprietors.

1 and 2. In the different parts of the country composing, since the beginning of this century, the present Kingdom of Wurtemberg, two sorts of small proprietors are to be met with.

(*a.*) The peasant cultivators, amounting, perhaps, to 180,000, who live in the villages and whose land is hardly ever held together, but intersected to a great extent by other properties. A proprietor of this class possesses here 1 acre, there ½ an acre, elsewhere ¼ or even ⅛-acre. Though cultivating themselves their small patches of land, they complete their means of livelihood by working as day labourers, or else follow various industrial pursuits. Their land is, after the death of the owner, if intestate, equally divided amongst his children, male and female, according to law. When, in accordance with the will of the father, one child becomes owner of all the paternal land, an estimate is made on a footing rather favourable to him (a so-called "Freundeskauf") and he compensates the brothers and sisters by equal sums of money.* The daughters, however, are more frequently on their marriage allotted an equal share of land; and as the husband is probably proprietor of a piece of land elsewhere in the commune, the intersection and subdivision of the land goes on increasing. No limitation exists among them, either by law or custom, to the division of property.

This class of cultivators is generally to be met with in the most fruitful parts of the country on arable land of a superior quality, vineyard, orchard land, &c. And a possessor of twenty acres would be greatly above the average.

(*b.*) The next class of small proprietors do not generally live in the villages, but in detached farm-houses (of which there are not 3,000 in the whole country).

* These sums must not amount to less than what is called the "pflicht theil," or "obligatary portion." Should there be four or less children, the "pflicht theil" would amount collectively to one-third of the whole property. If, for instance, the proprietor leaves 1,200 florins and four children, they have the right to divide 400 florins, receiving each 100 florins. Should there be more than four children, the "pflicht theil" amounts to one-half of the property.

Such farms are generally to be found in Upper Suabia, in the Black Forest, and in Franconia, consist of arable land, pasture and forest land, and are generally of from 50 to 300 acres.

The arable land is generally in these parts of the country less productive than those described in the preceding paragraph, and the density of the population is about one inhabitant to 4 or 6½ acres.

These larger peasant farms are not entailed; and since the freedom of proprietorship measure was passed, the law does not stand in the way of their sale or subdivision, but according to custom, the eldest son (in some parts of the country, the Uohenlohe district, for instance. though, the youngest) succeeds to the whole property, often in the father's lifetime. When the parent is incapacitated by age from managing his farm he retires to a small cottage generally on the property, and receives from the son in possession contributions towards his support both in money and in kind. The other children receive a sum of money calculated according to the size of the property and the number of children, but which, in any case, falls far short of the sum which they would receive were the property equally divided, or even were the law of "pflicht theil" acted on. They have, however, their home there until they establish themselves independently, or take service on another property. A gentleman who has been brought, in the exercise of the legal profession, constantly in contact with this class of proprietors, states that, though all rests purely on custom, there is seldom, if ever, any dispute as to succession; and though the written law provides that all properties should, on the death of the owner, be divided amongst his children, the above custom has become so time-honoured that it would be respected by the Law Courts, and not interfered with.

An idea of the distribution of landed property may be formed from the following estimates:—

	Per cent.
Estates of more than 200 acres	7
,, more than 50, and less than 200 acres	29
,, over 10 and under 50 acres	40
,, under 10 acres, down to as low as ⅛th of an acre	24

The number of large estates (above 200 acres) is, however, smaller than the above statement would show as in the per-centage are included the communal properties (subdivided internally) and also the Royal and State domains. The number of private estates over 200 acres in extent, is perhaps not more than 300 to 350 in the whole Kingdom, and such estates on an average do not consist of more than 350 acres each. In the Neckar district (the neighbourhood of the capital) one-third of the whole extent consists of estates or properties of from 10 to 30 acres each.

According to an official survey in July 1857, there were in the whole country 718 proprietors of more than 200 acres (a larger number than would appear from the previous per-centage); 2,895 of from 100 to 200; 11,721 of from 50 to 100; 16,795 of from 30 to 50; 61,098 of from 10 to 30; 73,243 of from 5 to 10; and, finally, 283,124 proprietors of less than 5 acres: in all, 449,594 landed proprietors. As, however, in this calculation many proprietors of land in different communes are counted twice over or oftener according to the number of properties or portions of land they may possess, the number would be reduced nearly one-third which would give 330,000 as the number of landed proprietors in Wurtemberg. The area of the whole country being about 6,000,000 acres, and of that about 4,000,000 acres being devoted to agriculture, each property would on an average consist of about 12 acres. It must be borne in mind, however, that of the 330,000 proprietors only 15,000 are actually independent farmers, while 180,000 are though actually proprietors of land not really farmers, but though cultivating their small patches of land gain their livelihood as day labourers or else by industrial pursuits.

The 15,000 farmers may be divided as follows:—

1. Fourteen thousand possessing farms more than 50 acres in extent, with a collective property estimated at 1,300,000 acres, and an average property of 93 acres.

2. Fifteen thousand with from 30 to 50 acres collective property, 500,000 acres average size of farm 37 acres.

3. Fifty-five thousand with from 10 to 30 acres collective extent of properties, 1,018,000 acres average size of farm 18 to 19 acres.

4. Fifty thousand with 5 to 10 acres collective property set at 380,000 acres, average size of farms 7 or 8 acres.

5. Sixteen thousand with about 5 acres or less collective property estimated 60,000 acres, average size of farms 3 to 4 acres.

The actual extent of the farms of this class gives, however, an incomplete notion of the actual position of the farmer; of course, the quality of the soil and the nature of

the farming as well as the situation of the farm may considerably alter its relative importance. A farm of 20 acres for instance in the Nuterland is a considerable one, while in many parts of the Alf and Black Forest districts, such a farm would hardly afford means of substance. In the wine district again, where cultivated land is worth from 800 to 1,000 florins per acre, a farm of 5 or 6 acres cannot be considered as a "dwarf property" whilst in other districts it would be too small to be profitable for any cultivation. It will be gathered from the above that, leaving on one side the 180,000 proprietors of land not actual farmers, the average size of the farms may be taken at 22 acres.

3. About forty years ago a system was introduced in Wurtemberg by which the whole country was surveyed, and the extent, estimated value, and ownership of every piece of land entered in registers kept at the office of the Mayor or principal officials of each commune, every change of proprietorship whether caused by sale, exchange, inheritance, or marriage is entered in the communal register so that no possible dispute can arise as to title, &c. A duty of 1 per cent. on the value of the property is charged by the State on each occasion on which a fresh entry (owing to change of ownership, &c.) has to be made in the register as well as a registry fee of $\frac{1}{5}$ per cent. charged by the commune. By applying for permission to inspect the communal register, an intending purchaser is enabled to ascertain at a glance the extent and ownership of any piece of land, however small, in the commune as well as a list of any debts or charges on such property by mortgage, and the purchase or exchange would be completed by the parties appearing before the Communal Council by whom the name of the new owner is registered.

A copy of the entry in the register is made by the magistrate of the commune and the signatures affixed.* The deed need not even (to ensure its validity) be drawn up on stamped paper. The Communal Council are answerable for the correctness of all entries with regard to every property. Conveyances in the legal sense of the word in England are unknown.

Though the simplicity of the system is most admirable, and though it is found in every respect most practical in its results as tending to prevent much unnecessary litigation, it is to be questioned whether the extreme facility of such process has not the effect of encouraging the constant subdivision of property.

4. Government affords no special facilities for raising loans upon landed property. There exist, however, several private companies founded for the purpose of enabling proprietors to raise money upon their estates. These do the large business while small proprieters obtain loans from the District Savings Banks (Oberamts Sparkassen) of which there are a considerable number in the respective districts. These establishments are not under Government control, but they are voluntarily placed under the supervision of the Government which superintends their working.

Advances are generally made up to half of the value of the property, sometimes up to two-thirds of the value. The rate of interest varies from $4\frac{1}{2}$ to 6 per cent., and the repayment of the loan is very frequently stipulated in annuities extending over twenty to twenty-five years. These institutions do not as a rule enquire closely into the objects of the loan, but merely consider the question of the security offered. In general, loans on landed property are made, to a great extent, by private persons, who prefer such investments to all others.

5. There are no statistics as to the indebtedness of the landed proprietors, or the number of mortgages entered in the mortgage registries. It must yet, however, be remarked as a notorious fact, that in this respect a great change has taken place during the decennial period 1853-63. Up to 1840 it is believed that the greater part of the capital in the country was lent out on landed security, and it is calculated that in 1841 the mortgages amounted to one-ninth of the whole value of the land, but the very facility to borrow money on real estate was the cause of the excessive elevation of the price of the properties, and in fact to the whole crisis which took place.

Upon this crisis, owing to the extensive executions levied, large sums were lost and capital turned to State securities and industrial undertakings, partly because confidence in the security of the state of agricultural affairs was shaken by the late events, and partly because agriculture, quickly recovering itself, was no longer in want of such loans; and, on the contrary was. under the more favourable circumstances resulting from the redemption of the feudal-dues, able to pay off large sums. It can be confidently asserted that now much the smallest portion of the capital of the country is lent on real security, and that a very great number of farmers are in possession of active capital.

In Upper Suabia especially, the number of farmers who hold State securities is very

* The validity of a sale of land does not depend on the registry, which is only a measure of administration.

large, and there are even many who hold shares in industrial undertakings of every description. In fact, it is probable that taking the farmers as a whole, the active capital in their possession almost equals the amount of the debts and mortgages on the landed property, taken collectively, and that it may, therefore, be said, as a whole, to be free from debt.

The small properties are, however, too general, heavily mortgaged. The sanction of the Communal Authorities must be obtained to every mortgage, which must be entered in the public register, and they would, of course, give their consent to no new loan if the debts of the intending mortgagee amount to the estimated value of his estate. Great security is thus afforded. In the absence of any agreement to the contrary among the parties concerned, the security offered must exceed by one-half the amount of the mortgage.

6. The mortgages are, as above stated, always entered on the Communal Register, and the local authorities are individually answerable for the correctness of the entries. Any person desiring to contract a loan on his property, in any part of the country, has merely to produce an attested copy, signed by the Communal Authorities, of any entries in the register relating to it, which would give the position, extent, and value, of each separate piece of land composing such property, as well as the amount and nature of any previous loans and mortgages upon it. This copy would be kept by the company or individual lending the money, and the mortgage would simply be inscribed on the register in the locality where the property is situated. The whole expense of registry would be about 1 per cent. of the amount of the loan, and the expenses of the mortgage would besides, amount to $\frac{1}{2}$ per cent. on the first 100 florins lent, and $\frac{1}{4}$ per cent. on every succeeding 100 florins.

The following are the crops raised:—

A. In the winter field:—Spelt, wheat, rye, and rapeseed.
B. Summer field:—Barley, oats, wheat.
C. Fallows:—
a. a. Pulse, beans, peas, vetches.
b. b. Flax and hemp.
c. c. Potatoes, beet-root, chicory.
d. d. Tobacco (small quantities).
e. e. Clover, lucerne, green fodder.

Naked fallows are only on inferior soil.

Rotation of Crops.—Triennial farming or the tre-fallow system is almost without exception practised: that is winter-field, summer-field, fallow. It is only on large and inclosed properties that there other rotations, and such are more or less the same as those practised at the Agricultural College at Wohenheim, which are of three sorts,

A.
1. Vetches, strongly manured.
2. Rape seed.
3. Spelt.
4. Oats and vetches, for green fodder.
5. Beet-root, &c. (manure).
6. Barley.
7. Clover.
8. Spelt.

B.
1. Green fodder, maize, naked fallow (strongly manured).
2. Rape-seed.
3. Winter crops.
4. Beet-root (manured.)
5. Summer crop (barley, oats, &c.)
6. Red clover.
7. Winter crops (spelt, wheat, &c.)

C.
1. Rape seed.
2. Rye and spelt.
3. Clover.
4. Clover pasture.
5. Oats.
6. Pulse-potatoes (manured).
7. Rye and spelt, with white clover and grass seed.
8. Clover.
9. Clover, for green fodder.
10. Spring pasture, then fallow (manured, and grazed by sheep).

Seed is sown on the small properties by hand, broadcast; on the large farms in general drill-machines are used.

Stock on the small farms are, without exception, kept in sheds or stables, and fed with green fodder during late spring and summer and the beginning of autumn. In fact it is very rare that cattle are pastured in Wurtemberg. Flocks of sheep (kept principally for the wool, consequently mutton is bad) are driven about from place to place in some districts; and old custom, not yet obsolete, stills exists, that the shepherds have at certain seasons, particularly autumn, the right to pasture sheep on other people's property; this is much complained of.

The number of cattle in Wurtemberg has increased greatly of late years, amounting

in 1843 to 688,029; it increased in 1865 to 974,917. This increase is to be accounted for principally by the high price of butchers' meat, and the high prices obtained for cattle exported to the Rhine, France, and Switzerland, also the elevation in the price of milk, butter, suet, &c., and the simultaneous and still continuing depreciation in the price of corn.

This change in the relative prices of corn and meat has had the effect that the farmers find the production of beef, milk, and butter, more advantageous than tillage; there has, consequently been a great increase in the cultivation of fodder. Clover crops, together with the cultivation of fallows with herbage for fodder, have been, aided by the influence of the Agricultural Societies much extended, and with favourable results.

It may be safely declared that cattle breeding in Wurtemberg has advanced fully in proportion to the progress of agriculture in general, and that while the fall in the price of corn has necessarily diminished the profits of the farmer from the soil in respect to the cultivation, he will thus find a full compensation, and gradually the corn crops will become more and more restricted in quantity, while the green and root crops will be even more extended.

The land in cultivation increased from 1854 to 1864 to the extent 18,974 acres, of which one-third was from 1863 to 1864. The increase in crops, devoted especially or entirely to the maintenance of cattle, amounted, however, alone to 15,914 acres. As a large decrease was observable in the crops of flax and hemp.

The diminution of "naked or dead" fallows ("reine brache") in the same decennial period amounted to no less than 141,911 acres.

As to the proportion between tillage and grass lands it is in general that of 3 to 1. In the grass land must, however, be included the arable fields cultivated with green fodder, so that it may be laid down that half of the cultivated area is devoted to tillage, and half grass land.

The information with regard to the rotation of crops (which I obtained on a visit to the Agricultural College at Hohenheim) apply probably (at any rate the eight-field rotation) to heavy land.

8. The Department for Agriculture are using their best endeavours to encourage the use of machinery amongst the small proprietors. They have opened a permanent exhibition in the capital of agricultural implements, where farmers are able to order them at the cheapest possible rate, and where their uses and advantages are explained. As the small peasant proprietors hoe together in villages they are beginning to purchase the simpler sorts of machinery among them, on what may be called a co-operative system, and machinery is also let out for hire in some of the larger villages: but in most of the districts where the small properties exist, thrashing, fodder cutting, and drilling machines are the only ones to be found, and those very rarely; even the ploughs are of the most primitive description. On the larger farms corn is mowed; on the smaller, cut with a sickle.

The number of hired day labourers, properly so called, in the whole country amounts to 48,000, which would give an average of $\frac{1}{68}$ per acre. This is, however, of little value, as 70,000 sons of farmers and peasant proprietors, and 60,000 male and 50,000 female servants may be reckoned to a certain extent among the day labourers, as well as a great proportion of the small proprietors whose property is so minute as not to require their whole labour and that of their families.

The position of the day labourer in Wurtemberg may be considered as superior to that of the day labourer in most parts of England, for most of them possess a part of a house and a patch of land, if but one-fifth of an acre. His wages are from 1*s.* 2*d.* to 1*s.* 8*d.* per day and his food. His taxes, house rent, &c., amount to perhaps 1*l.* a-year; most of the necessaries of life are cheaper than in England, and the standard of living much lower.

Those who live with their employers receive:—males 5*l.* to 6*l.*; females 2*l.* to 3*l.* per annum.

9. Considerable numbers of the small proprietors emigrate yearly. As there is little positive distress among the agricultural classes, this is to be attributed more than anything else to the innate predisposition of the Suabian race to a wandering life and to enterprise; as well as to the fact that the large number of Wurtembergers who are settled in America under favourable circumstances, and who, taking into consideration the class from which they spring, are highly educated, carry on an extensive correspondence with the mother-country, and thus encourage their countrymen to emigrate. For the last two years also the new Military Law on the Prussian system has driven many youths of 18 or 20 to emigrate as a mode of avoiding the now lengthened term of military service. The restrictions imposed on marriage by the laws of the country, as

well as by the Communal Regulations, which do not permit a man to marry unless he has the means of supporting a family, act to some extent as an additional inducement to emigration, but less than formerly.

It is calculated that the number of Wurtembergers who emigrated to America from 1845 to 1865 amounts to nearly 200,000, of whom more than half men in the prime of life, and more than three-fourths grown-up persons.

In the decennial period from 1851 to 1861, the number of emigrants from Ireland amounted to about 1,200,000, and the population of that country may be taken at that period at 6,000,000, having varied from 6,500,000 in 1851 to 5,700,000 in 1861. The proportion of emigrants to the population was therefore that of one to five. In the same period the number of emigrants from Wurtemberg was, according to the above, made by Herr Rumelin (one of the most trustworthy writers on such subjects), at least 100,000, and as the population of the Kingdom may be taken as being then 1,600,000, the proportion of emigrants to the population was that of one to sixteen.

The average number of emigrants yearly, is however, about 4,000, but in the years 1853, there was an emigration of no less than 36,000 persons taken, for the most part, from the class of small proprietors and daily labourers, and which was the result of the four successive bad harvests in 1850, 1851, 1852, 1853, as since that period the average has fallen to the normal rate. The emigration in the two above-mentioned years 1853, 1854, was greatly encouraged by the Government, owing to the great distress prevailing, and as the census taken in 1855, showed a diminution in three years of about 65,000 in the population of the country, or more than 3 per cent. while the increase in the three years from 1843 to 1846 amounted to 46,000, it may be judged how sensible were the effects on the population of the years of distress.

The districts where the land is sub-divided to a great extent, were those which suffered the most severely in the six years from 1849 to 1855, inasmuch as the population of fifteen districts where the land is, without exception, held by small proprietors, was reduced from 400,000 in 1849 to 360,000 in 1855, being a diminution of 10 per cent. and from these districts the larger number of emigrants proceeded.

It may be remarked that there was during this period, little or no emigration or decrease in the population of Upper Suabia, where the whole country is occupied by large farmers. On the contrary, owing to the good effects of the abolishment of feudal tenures, and the then enhanced price of corn, these districts suffered imperceptably during the famine years, and the population progressed pretty much at the ordinary ratio.

10. It may be stated that the small proprietors, almost invariably live in the villages adjacent to their properties, in fact much inconvenience is experienced by the difficulty as well as loss of time in cultivating outlying pieces of land.

11. If twenty-two acres is taken as the average extent of each farm in Wurtemberg, some idea may be formed of the general circumstances of the farmer by the following calculation:—

The value of the yearly produce of each acre of cultivated land may be estimated at 33 florins, (including the value of green fodder in so far as it increases the profits of the cattle on the farm) which would make a total of 726 florins. From this, however, 30 per cent. must be deducted for primary expenses, for seed, maintenance and wages of labourers, support of the necessary horses or cattle, and for wear and tear of the stock, and agricultural implements, which would reduce the nett profits of the farmer on a farm of twenty-two acres to 508 florins. To this amount must be added, however income derived from many other sources, namely, the farmer's share in the not inconsiderable "Privat wald hesitz," or forest property, his participation in the profits of the numerous and important communal forest properties or "Gememde waldungen," his receipts derived from letting his waggons for hire, the rents derived from farming lots belonging to different neighbouring small proprietors, the very considerable profits of a poultry yard, and from various domestic employments, such as spinning-wheels, &c. Also profits made by at least one-fifth of the farmers: in the case of the larger, from breweries, tan-yards, public houses, corn-mills; and in the case of the smaller, from bakehouses, &c.

Taking all this into consideration, it will not be far below the mark, if the average yearly income of a small farmer and his family is reckoned at from 600 to 700 florins a year, besides the possession of his farm-house.

Writing in Germany, the small proprietors may be called well housed, well fed, and well clad, their standard of living being, however, it is true, very low. In the country potatoes form the staple food of the poor, and but little meat is consumed, the poorest, however, are hardly ever without rye-bread. In general, farinaceous substances being much used as food.

Large quantities of cyder, country wine, and beer are consumed by the labouring

classes, the average consumption of each man in the fields being from four to as much as eight quarts of cider per day. Much less beer is drunk than in Bavaria. The practice, however, of issuing cider or sour wine, in lieu of an equivalent value in wages does not exist, so that the labourer has not a quantity of bad, unwholesome drink forced upon him, as cider is in some parts of the South of England, which has the effect of giving as it were a public sanction to the constant use of intoxicating liquors.

The houses are generally large, solidly built, and very rarely in the case of small proprietors, isolated, but in villages, often at some little distance from the respective properties. The houses are indeed necessarily large, as the whole produce of the fields, hay, straw, corn, horses, cows, and live stock generally, is under the same roof. This practice is often the cause of great misfortune, as in the case of fire, all is generally lost, and the adjoining houses in the village endangered.

In estimating the standard of living, and the general circumstances of the small proprietors, it must be borne in mind that in Upper Suabia, parts of the Black Forest, and Danube district, the farmers are of a superior class; they and their families live habitually on meat; their clothing is of a good quality and their daughters may be seen wearing silk dresses.

12. The average population per acre in the Neckar district where the land is almost wholly held by small proprietors is one inhabitant to $2\frac{1}{8}$ acres, while the average population per acre in the districts where the cultivation is that of large farmers, is one inhabitant to every $4\frac{3}{4}$ acres.

The annual rate of increase in the population among the small proprietors amounts to about 0·64, while the urban population increased in the five large towns, Stuttgart, Cannstatt, Esslingen, Ludwigsburg, and Heilbronn, at the rate of 1·58 per cent., but taking the sixteen towns containing more than 5,000 inhabitants, it will be found that the urban population increased in forty years at the rate of 84 per cent, and a yearly increase of 1·9 per cent. is exhibited.

It is to be remarked, however, that the annual rate of increase of the population in the district where large farms are prevalent is only 0·25.

13. Wurtemberg is remarkable as the country where subdivision of land is carried to the greatest extreme, and the sad experience of yet recent years of scarcity have led public opinion to consider that the extraordinary number of small independent cultivators as the main cause of such misfortunes. One of the most distinguished writers on the subject argues, however, that the statistics give a false and exaggerated idea of the case. Allowing that there are 150,000 independent farmers, in the actual acceptation of the term, it is declared that the fact of the existence besides these, of 180,000 small proprietors of land, is attended by no evil results. The possession by almost every family among the rural population of a small piece of land from which they derive subsistence from their live stock, and vegetables, &c., for their domestic consumption, does not, it is declared, have any bearing on the question of small proprietorship and sub-division of the soil, but is only a peculiarity of social existence. That two-thirds of these 180,000 peasant cultivators have in reality in their hands a very small proportion of the cultivated area of the country, and that of the 4,043,000 acres of land devoted to agriculture, at least 3,500,000 must be considered as actually in the hands of the 150,000 farmers who according to this estimate possess on an average each a farm of 22 acres.

As far as the class of really small peasant cultivators are concerned, there is no doubt that the evils of small proprietorship are felt most sensibly. In the Neckar, and part of the Black Forest districts, there is hardly a commune without a number of dwarf properties, and many where there are no middle-sized properties as all, and where small properties possessing any sort of vitality are in the minority. In many communes, owing to want of sufficient area or the poverty of the soil, the inhabitants are unable to obtain a livelihood from agriculture, and the conditions of obtaining a livelihood from industrial pursuits are wanting, and consequently a redundance of population prevails. Such are most frequent in the fertile wine districts, and this may be accounted for by the fact that the cultivation of the vine by small proprietors, as is usually the case in Wurtemberg, necessitates, owing to the irregularity of the profits, the possession by the cultivator of at least sufficient garden or arable land for the maintenance of himself and family, so that he may not have to depend entirely on the receipts of his vineyard. This condition is very frequently wanting, especially in the narrow valleys with steep declivities where there is no room for arable land, and where the tillage of the land on the surface of the hills is attended with considerable difficulty. Villages in such a situation do not generally even supply themselves with bread, and suffer severely in years when the wine crop fails, which may often be the case eight or nine years in succession. The profits of a vineyard are, however, so considerable, that a good harvest every tenth year would almost make

up for nine bad years; the vine cultivators are, however, rarely provident enough to lay by a large sum out of the amount realized on the good year.

Speaking generally, however, the evils of small holdings are not so sensibly felt in Wurtemberg as, for instance, in Ireland, for though it may be alleged that their existence has a tendency to rapid increase of the population, while at the same to a decrease of the means of supporting it, yet the Wurtemberg peasants, who are a careful, thrifty race, and who do not cultivate the land in a slovenly manner, but make it, by careful though primitive labour produce as much as it is capable of producing are compelled, in the absence of any extensive industrial pursuits, to lean on the land for support, and look upon agriculture as a means of subsistence, and not at all as a means of employing capital to advantage.

The communal regulations which in a country of small proprietors cannot be considered otherwise than excellent, are intended to prevent marriage, except under certain restrictions, to act as a bar to an excessive augmentation of the agricultural population, and prevent the land being crowded by more human beings than are necessary to cultivate it, or than it can fairly support. Nor do the above regulations permit persons to settle in a commune unless they have means of subsistence. The laws imposing restrictions on marriage are, however, now carried out with great lenity in consequence of the opposition they have met with in the country, and they are about to be entirely abolished. It is probable, though, that their very existence may have had some effect on the steady yearly tide of emigration, and may account for the fact of the majority of the emigrants being unmarried.

In the next place, in Ireland, there are in most districts fences on the holdings which causes a loss which is estimated at as much as 6 acres in 100. In South Germany, on the contrary, the separation of the patches of land is marked by stones as landmarks, so that there is no space wasted, nor is the land disfigured as is the case where there are very minute holdings. The destruction or removal of these landmarks from their proper place is, it may be mentioned, punished very severely and rarely practised.

The climate also is not so uncertain as to necessitate as a rule great expedition or an unusual amount of extra labour in seed time and harvest, the necessity of which in Ireland is unfavourable to the small farmer, whose capital does not permit him to command either extra labour or machinery. The evil of small properties is also to some extent modified in Wurtemberg by so many of the small cultivators living together in one village which enables them to aid each other in the work of their farms, which introduces to some extent the co-operative principle, and gives them the advantage of making use of at least the elementary descriptions of machinery which have as yet been introduced in the country. It may finally be stated that public opinion has undergone considerable change of late years as to the advantages or disadvantages of the subdivision of property, especially since the competition of Hungarian corn has taken away the monopoly which South Germany formerly possessed of the Swiss market, and since its increased importation by the greater millers.*

The political economists are in general in this country of opinion that small proprietors who complete their means of livelihood by industrial pursuits are the class which it is most desirable to encourage, whereas formerly agriculture on a large scale was considered the most profitable. The laws in themselves, by the equal division of paternal property, act in favour of the perpetuation of the system of cultivation by small proprietors, except in the districts added to this kingdom in 1803, where, owing to the relative inferior fertility of the land large farms are a necessity, and where the subdivision of properties would, owing to the absence of industrial pursuits, be the ruin of the whole district. The Wurtemberg Government have never, however, thought fit to make any modification of the written law, though owing to reasons of political economy, they never in those districts enforce it, and so far from appealing to the laws of the country for protection the farmers are content even on the death of one of their order intestate to let matters be settled as they have been for generations past, which consists in a meeting being called of the heirs of the deceased, and of a deputation of the Communal Council ("Gemeinde Rater"), composed of the principal farmers, together with the notary public—termed the "Waisen Gericht," who declare with the assent of the heirs that the property of the deceased shall be assigned to the eldest (or in Hohenlohe, the youngest) son, the others receiving small portions at the discretion of the "Schultheiss" or magistrate of the parish (usually selected from the "Hofbauern" or large farmers). Such portions do not however even amount to the "Pflicht Theil,"* or portion they could legally claim.

The notary public draws up a *procès-verbal* of the settlement, and the signatures of those present give it the validity of a contract.

* See note to answer to Queries 1 and 2, Division (A).

Public opinion has never pronounced itself very decidedly upon this custom, but there is little doubt that it would be difficult to disturb it.

(B.)—Tenants and Sub-Tenants under Landlords.

Tenure.

1 and 2. The smallest quantity of land held by tenant farmers would, as a rule, be from 50 to 100 acres; their farms are, however, for the greatest part, from 100 to 250, or even 500 acres in extent. But there are very few tenants in Wurtemberg, and those chiefly on land belonging to the State, the Royal Family, and the great landed proprietors among the nobility, in so far as such land is not occupied by forests, which, without exception, are never let.

The State property, exclusive of the forests, consists of about 17,000 to 18,000 acres, and is divided into about fourteen large, and some smaller farms, of which:

	Acres.
Arable land	10,000
Grass or meadow	7,000
Garden	644
Vineyard	77

The whole of it is occupied by tenants, to whom it is let, in general, on long leases (as a rule, eighteen years), by public auction, the administration not, however, binding itself to accept the highest bid. Sub-tenancies are not permitted, inasmuch as the administration attaches the greatest importance to the character, agricultural education and antecedents of the tenants who have, in the case of the larger farms, to deposit a security for the due fulfilment of the conditions of the lease as to artificial manuring, mode of cultivation, amount of live stock, &c. The properties of the mediatized Princes and the large landowners are administered on the same system; though in all these cases isolated or outlying pieces of land are exceptionally let out to small proprietors in the neighbourhood, but on short leases.

In the event of the sale of the property, the tenant, should his lease not be renewed, could claim compensation from the heirs for any improvements which he may have made under the idea that he would occupy his holding for the full term.

For as the *bonâ fide* sale of land or house property renders (in the absence of a previous specification to the contrary) all existing leases null and void, the tenant can claim compensation on account of his improvements or his labour rendered unproductive from having to resign his tenancy.

A tenant, therefore, occupying a holding after a change of proprietorship would, unless with a fresh lease, become a tenant-at-will, liable to be ejected at three months' notice. In most cases, however, the consequences of the death of any individual proprietor, or the sale of the property, are settled previously by contract.

3. Tenancies are always created by written agreement. In exceptional cases of absence of such agreement the law would in no way interfere as to the duration of tenancy, and the farmer would be considered a tenant-at-will, and would be obliged to quit the next term after receiving notice.

4. There is no system of registering in any public office agreements as to tenancy.

5. This question, probably, applies to cases of tenancies renewable from year to year. Of course in the previously-mentioned cases of long leases the tenant remains in possession so long as he fulfils the conditions of the contract. Before its expiration the tenant could only be dispossessed upon gratuitous deterioration of the property being proved before the Law Courts, by whom he would be rendered responsible.

6. No such custom exists in Wurtemberg.

Rent.

1. The payment of rent is always in money, and not in a share of the produce. It is, however, nearly always the custom, when the proprietor or landlord is resident on or near his property, that the tenant supplies him with whatever milk, eggs, butter, fruit he may require personally for the use of his house, as well as forage for his horses and manure for his gardens. These are, however, matters of detail and previous arrangement.

2. The rent is fixed by competition, or else by agreement with the tenant; it is generally payable half-yearly, but in some few cases yearly.

3. The proprietor has no right to raise the rent. Should it not be paid on the

proper day he gives notice to the authorities of the commune; the tenant then is given a term of thirty days within which he must fulfil his obligation. Should he contest it the proprietor has no resource but a law suit. Should the tenant not contest his obligation to pay the communal authorities would levy an execution on his effects. Should it not be specified in the contract that non-punctual payment of the rent during one year puts an end to the tenancy, the law provides that non-payment during two consecutive years is alone sufficient to such end.

Evictions.

1. Information upon this subject has been already given under the previous heads.

Improvements.

1 and 2. The landlord can only compel the tenant to keep the buildings in proper repair, and in general to keep the property in order. The buildings are almost always erected by the landlord.

3. Improvements made by the tenant if moveable may be taken away; for such as are not of that description he may claim compensation is so far as the actual value of the property for any subsequent tenant is thereby increased.

4. Should the landlord and tenant not agree as to the value of such improvements the tenant would be compelled to bring an action against the former.

5. The tenant can in no way mortgage his tenancy, but he can on his personal security, or that of his friends, obtain money for any improvements he may consider necessary from the companies mentioned in the answer to Query A 4, who enjoy no special rights with regard to tenants.

* * * * * * *

Improvements of any considerable description, such as drainage, inclosing, &c., are undertaken by the landlord, who, however, generally (in the State properties) claims the yearly interest on his outlay from the tenant. With regard to improvements even in the nature of fixtures in the farm buildings made by the tenant, he is only compelled to leave such buildings in the state in which he found them.

Miscellaneous.

1. The relations between landlord and tenant are always regulated by compact, and the rights of both parties are fully protected by law, nor is any legislative interference required for the better protection of tenants.

2. The tenants upon the larger estates belong, as a rule, to the educated classes; they employ machinery, and their mode of cultivation is on a par with that of large farmers in England. An allusion to their mode of cultivation is made in the answer to Query 7 A.

3 and 4. Owing to the very limited number of tenants in Wurtemberg, Query 3 cannot be answered with any precision.

They do not, except in isolated cases, emigrate.

5. The general feeling is against the existence of tenancies, as it is considered that many tenants try to draw as much as possible out of the land during the last three or four years before the termination of their leases. Owing to the inconsiderable number of tenancies it cannot be said that there is any prevalent public opinion on the subject.

6, 7, 8, 9, and 10. The legislature never has been called upon to interfere between landlord and tenant, the relations between whom are on a thoroughly satisfactory footing.

All these questions, as well as that relating to the tenures resembling the copyholds in England, have been answered as far as possible in the previous portion of this Report, where a sketch has been given of the progress by which the small proprietor class has been in the last thirty years created, as well as the system on which the proprietors or landlords were compensated for the limitation made in their feudal proprietary rights by the abolition of feudal tenures, and the system, which was one which of course tended to increase the number of owners and freeholders is, as above mentioned, still in force; and also (in answer to Query 10) that public credit assisted to a very great extent the holders under feudal tenures to become independent proprietors.

11. The laws favour the dispersion of property, in so far that the custom of dividing the paternal property equally among all the children is the only one sanctioned by law. As already stated, the accumulation of land in one hand has become a fixed custom in Upper Suabia, Franconia, &c., and one so time honoured that it has overridden the actual written law.

It may be remarked, however, that the districts where this custom is prevalent are generally those which belonged to other States, and did not integrally form part of the Kingdom of Wurtemberg.

Appendix (A.)

Table (A.)

	Acres.
Total area of Wurtemberg in acres (German)	6,188,252½
Arable land	2,628,337
Meadow	881,607
Garden	121,504
Vineyard	82,921
Pasture	266,931
Forest	1,919,311
Uncultivated area	259,718
Of which, waste land	83,263

Land tax per acre	0	26

Appendix (B.)

Management and Appropriation of Timber.

All forests in the Kingdom of Wurtemberg are, in accordance with the forest laws (which have been in force since 1614), placed under the control and police of the State forest officials. In compliance with these regulations the Corporations of the respective communes are required to have their forest accounts and plans kept by competent persons; besides which, it is the duty of the forest inspector to designate the wood which should be felled in the forests belonging to the communes and foundations, as well as generally to superintend the management and appropriation of the revenues of such forests. On the other hand, some modifications have of late years taken place in the superintendence exercised by the State over the private forest proprietors, in so far that the forest inspectors are authorized to give written permissions to such proprietors to fell wood without personal examination of their forests, especially when such inspectors are prevented by their other official duties from making their inspections at the convenience of the proprietors; besides which, the latter are not restricted in their mode of management, in so far as being able to fell wood for their personal requirements, without any permission from the inspector.

The forest officials and guards are well paid, and organized on a military system. They have the right of trying and punishing all offences against the forest laws, and which in 1848-49-50 amounted to no less than 75,000 per year. They have now diminished considerably. Communes and all forest proprietors are entitled at a reasonable cost to place their property under the guardianship and tutelage of the Government forest guards, when not prevented by their duties from undertaking it.

The forest area of the country is divided as follows:—

	Acres (German).
State	592,825
Royal	17,668
Communal	548,603
Foundations	52,556
Mediatized Princes and nobility	243,827
Corporations or Companies	52,557
Private	372,394

Of the whole area of the country no less than 30 per cent. is occupied by forests (being about 1 acre per head of population), somewhat less than in the neighbouring States, as in Bavaria the forests occupy 34 per cent. of the whole surface, and in Baden 33 per cent.

The timber belonging to the State forests is sold by auction in the respective districts on fixed days; that belonging to the communes is, when felled, divided among the members of the commune, who must fetch it away on the appointed days.

Mr. Phipps to Mr. Gordon.

Sir, *Stuttgardt, November* 26, 1869.

I HAVE the honour to forward to you for transmission to the Foreign Office a Report, which, in accordance with your instructions I have drawn up, with regard to the laws and customs affecting the tenure of land in Wurtemberg.

Without omitting the points noticed in the body of Lord Clarendon's circular of August 26, I have endeavoured to condense such information as I am able to supply under the heads of the respective queries inclosed in that circular. I regret, however, that the information under head B is, as explained in the Report, necessarily so imperfect, owing to the very limited number of tenants in this country, and those of quite a different class to the Irish occupiers of land.

I have not found it necessary to avail myself of the permission given in the circular of the 23rd September to charge any expenditure incurred by me in visiting any particular districts, as I have obtained my information partly from persons who have been resident in districts where any special customs may exist affecting the tenure of land, and partly from investigations made in the Neckar District, in the immediate neighbourhood of this capital, and at Uohenheim. It is possible, however, that I may have to ask your permission to charge some small consultation-fee, which may be expected by a gentleman from whom I have obtained some information on legal points, also the expense which I had necessarily to incur in consulting works on the subject in question, amounting however only to a few florins.

I have, &c.

(Signed) E. CONSTANTINE H. PHIPPS.

No. 9.

Mr. Gordon to the Earl of Clarendon.—(*Received December* 22.)

My Lord, *Stuttgardt, December* 18, 1869.

I HAVE the honour now to forward, herewith, Mr. Baillie's despatch covering his Report on the Tenure of Land in the Grand Duchy of Baden, the latter of which reached me in its present state last night. The earlier date of Mr. Baillie's covering despatch is accounted for by its having been necessary to return to him the Report for the correction of certain inadvertencies which it at first contained.

Not being resident in the Grand Duchy, I am not competent to add anything material to the above report, but in reading it over, the following remarks occur to me with regard to a few points referred to therein.

Near the opening of the Report, under the head of "Population," Mr. Baillie states the fact of the great increase of emigration since 1865, and seems to attribute it, as well as the greater decrease of the male, as compared to the female population, chiefly to bad harvests and industrial distress occurring after the American war.

The same phenomenon was manifest in this country at the above period, as has been reported to your Lordship in my despatches of last autumn, as well as in Mr. Phipps' Land Tenure Report. But both the latter gentlemen and I have seemed to perceive its chief cause in the Prussian War of 1866 and of the more stringent conscription Regulations introduced, in consequence, into the South German States. I cannot but believe, that to this cause is mainly to be attributed the late increase of emigration from Baden, also in which country the conscription and military obligations of the population have been settled since 1866 on a more stringent basis than in any other of these countries.

The curious facts adduced by Mr. Baillie of the Baden emigration into the neighbouring German States and of the lower proportion of men to women in the Grand Duchy, during the above years, as compared to former periods, as well as the age of fourteen, above which this decrease in males is observable, all seem to confirm the explanation of the above which the correspondence from Stuttgardt had given rather than what appears the wholly insufficient one offered by Mr. Baillie.

Under the title "Credit Institutions," Mr. Baillie reports the frequent indebtedness of the Baden small proprietors. In Mr. Phipps' Report, the contrary is stated to be the fact in Wurtemberg and inquiries which I instituted on the subject, because, I confess, I supposed him to have been misinformed, fully confirmed Mr. Phipps' statement. This difference of pecuniary Condition among the same class in two adjoining States of such similar material character is curious and requires explanation.

Mr. Baillie's Report, title "General Condition of Small Proprietors," as to the tendency of public opinion, with regard to the advantages of small holdings, agrees essentially with that stated by Mr. Phipps to prevail here, confirmed as it seemed to be, by the views of Baron Varnbüler, which I had the honour to report in my despatch transmitting his Report.

There is another remarkable difference between Wurtemberg and Baden custom on the point of subletting, which in the former State, as reported by Mr. Phipps, is only permitted when expressly stipulated in the lease, whereas in the latter it is, on the contrary, always allowed to the tenant, except when expressly prohibited. Perhaps the prevalence in Baden of the Code Napoleon may account for this discrepancy.

Mr. Baillie makes no reference in his Report to the Forests and Forest-management in Baden, although it is a species of culture, under which, probably, a much larger proportionate area is submitted in the Grand Duchy than in this Kingdom. But as the period for transmission of his Report has been so much delayed I do not like to detain it longer on this account.

At Mr. Baillie's request also I do not delay forwarding his Report for certain information which he expects to receive as to the rotation of crops and which will be sent as soon as possible.

I have, &c.
(Signed) G. J. R. GORDON.

Inclosure 1 in No. 9.

Mr. Baillie to Mr. Gordon.

Sir, *Carlsruhe, December* 9, 1869.

I HAVE the honour to forward to you herewith my Report on the Tenure of Land in Baden, and also a copy of a Report issued by this Government on the number and condition of the live stock in this country.

I have only further to express my regret that owing to the difficulty of obtaining the necessary information I have been unable to send in my Report sooner.

I have also the honour to mention to you that Baron Freydorf has expressed to me the hope that Her Majesty's Government would be good enough to place at the disposal of the Baden Government one or more copies of the collection of Reports on Land Tenure whenever they shall have appeared in print.

I have, &c.

(Signed) EVAN P. M. BAILLIE.

Inclosure 2 in No. 9.

Report respecting the Tenure of Land in the Grand Duchy of Baden.

Population.—ACCORDING to the census of 1867, the resident population was as follows:—

		Per cent. of total Population.	Increase or Decrease.	Per cent.
Males—				
Above 14 years	482,967	33·65	—3,187	—0·66
Below 14 „	217,654	15·17	+3,384	+1·58
Total	700,621	48·82	+197	+0·03
Females—				
Above 14 years	518,030	36·10	+1,816	+0·35
Below 14 „	216,319	15·08	+4,922	+2·33
Total	734,349	51·18	+6,738	+0·93
Both sexes—				
Above 14 years	1,000,997	69·76	—1,371	—0·14
Below 14 „	433,973	30·24	+8,306	+1·95
Total population ..	1,434,970	100·00	+6,935	+0·48

The population increased very slowly in the period from 1864 to 1867. The increase has only been 0·48 per cent., or an annual average of 0·16 per cent., whereas from 1861 to 1864 the average annual increase was 1·46 per cent., and from 1811 to 1864, 0·83 per cent.

The cause of this slight increase is undoubtedly emigration. Bad harvests, and various circumstances unfavourable to industry gave rise to a very considerable emigration immediately after the termination of the American civil war.

The official lists for 1865 show 2,735; for 1866, 3,030; in 1867, 3,386: altogether 9,151 emigrants. The number of Baden subjects, however, who secretly leave the country without thereby renouncing their nationality must be placed at a much higher figure, and the total number of all the persons who emigrated during the period 1865–67 may be reckoned at 25,000.

The excess of births over deaths in 1865 was 12,237; in 1866, 15,649; in 1867, to about 15,000: altogether about 43,000.

Immigration, including naturalized persons, in 1865, 419; in 1866, 257; in 1867, 308: altogether 975. Therefore, deducting the emigration of 25,000, there must still have been an increase of population of about 19,000. The returns, however, only show about 7,000, leaving about 12,000 souls to be accounted for.

A slight increase (2,872) in the number of foreigners in the Grand Duchy is observable.

The discrepancy, therefore, has reference solely to Baden subjects. In fact, it is evident, from the concurrent statements received from various parts of the country, that the number of Baden subjects residing temporarily in the neighbouring countries has

increased, and this increase probably amounts to about 15,000 (namely, the above 12,000 the increase of foreigners).

This kind of drain on the population is also the result of circumstances either general or local, affecting industry and the means of earning a livelihood.

In confirmation of the above supposition it is to be observed that the male population increased much less than the female.

There is, in fact, a decrease in the number of males above 14, who would naturally be the first either to emigrate or to leave the country temporarily in order to better their condition.

The average annual proportion of men to women from 1830 to 1864 was 100 men to 104·9 women. In 1864, the proportion fell for the first time below 104 to 103·88, and has now again risen to 104·81.

Religion.

	1864.	Per cent. of total Population.	1867.	Per cent. of total Population.
Evangelical	470,443	32·94	475,918	33·17
Catholics	929,860	65·11	931,007	64·88
Menonites	1,388	0·10	1,319	0·09
Other Christians	1,165	0·08	1,116	0·08
Jews	25,234	1·77	25,599	1·78

The population of the towns was 383,001 (26·7 per cent.).

That of the country, consequently, 1,051,969 (73·3 per cent.) The former has increased by 12,123 souls since 1864 (3·27 per cent.), the latter decreased by 5,188 souls (0·49 per cent.)

The number of communes is 1,624, and inhabited houses 286,071, in 1864, 282,069, showing an increase of 4,002, or 1·42 per cent., annually.

Land Occupation.

The superficial area of the Grand Duchy consists of:—

	Morgen.	Per Cent.
Arable land	1,525,000	35·6
Forests..	1,411,000	32·9
Meadow land	440,000	10·25
Roads, water, &c.	440,000	10·25
Pasture	300,000	7·0
Vineyards	60,000	1·4
Gardens	40,000	0·9
Waste lands, quarries, turf fields	22,000	0·5
Lake of Constance	51,000	1·2
	4,289,000	100·0

The Baden morgen contains 3,600 square mètres.

The pasture lands are communal property, and are used in common by the citizens of each commune. About 40 per cent. of the population are employed exclusively in agriculture, 3 to 6 morgen correspond to each person of the exclusively agricultural population, and 18 morgen to a family, the family being reckoned at five souls.

The total number of persons who cultivate the soil is, in reality, much larger.

Many factory workmen, artizans, dry-labourers, and others engaged in industry, combine agriculture with their other occupations.

There are many landed estates belonging to the State, to communes, foundations, corporations, mediatized Princes, large and small proprietors which are not farmed by the proprietors themselves, but are let to tenants, generally in small holidays.

Agriculturists, day-labourers, and the so called "Halb banern" (usually half peasants), have thus the means afforded them of renting patches of land, and eventually, by diligence and economy, raising themselves to the condition of independent proprietors.

The land in Baden is generally very much sub-divided. Large estates are rare.

There is, however, a certain class of landed property, especially in the Odenwald Black Forest, and the thinly populated district north of the Lake of Constance, called "Hofgüter," which cannot be divided, and which descend from the proprietor to his heir

according to a fixed law of succession, and under certain conditions as regards the provision for the other children when the family consists of more than one son or daughter.

The average size of small holdings in the Valley of the Rhine and in the Lower Hill districts is abont $\frac{1}{2}$ morgen, in other parts $\frac{3}{4}$ morgen.

There are 111,300 independent farms, on which cattle for tillage are employed, and 2,940 without cattle, altogether 114,244.

In the plain, and on the hill slopes where the vine is chiefly cultivated, the size of a farm capable of supporting a family is from 5 to 7 morgen. If the family consist of three members capable of labour, they can farm 8 to 10 morgen.

In the mountain districts 20 to 50 morgen are needed for the support of a family, and 50 to 60 the extent they can farm.

Day-labourers are engaged when the farm attains the size of 12 morgen. On farms of 65 to 70 morgen, servants, servant-girls, and assistants are also required.

Over the arable land alone, 13·29 morgen correspond to each farmer employing cattle for tillage.

Number of cattle employed for tillage in 1867 :—

Horses	57,861
Oxen	56,086
Cows	145,513
Total	259,460

Of the 111,700 proprietors of cattle :—

11,742	or 10·55	per cent. employ	1 ox or cow.
12,741	or 11·45	„ „	1 horse.
48,222	or 43·33	„ „	2 oxen or cows.
8,720	or 7·83	„ „	2 horses.
8,845	or 7·95	„ „	3 oxen or cows.
1,725	or 1·55	„ „	3 horses.
7,384	or 6·63	„ „	4 oxen or cows.
704	or 0·63	„ „	4 horses.
1,010	or 0·91	„ „	5 oxen or cows.
2,243	or 2·02	„ „	2 oxen or cows and 1 horse.
1,704	or 1·50	„ „	2 oxen or cows and 2 horses.

The above Table shows 103,040, or 94·35 per cent. of the total number of proprietors of cattle for tillage. In addition to these, 298 employ 8 to 12, 50 employ 12 to 20, 19 employ 20 and more animals for agricultural operations.

As one such animal corresponds to 8·80 morgen of arable land, it is evident that by far the greatest number of farms in Baden do not extend over more than about 9 morgen (65 per cent.). Farms of 200 to 300 morgen belong to the class of large farms. Farms 1,000 morgen and upwards are rarely met with.

The land is not occupied by tenants under proprietors as a general system in Baden.

Farmers do not form a special class. Both large and small proprietors frequently farm their own land, and day labourers, as well as persons engaged in trade and industry, rent patches of such a size as they consider likely to yield the best return for the time and labour they are able to expend on their cultivation.

(A.)—Small Proprietors.

Law of Descent.—Upon the death of a proprietor, the land is usually divided equally among his heirs, not, however, to an extent below $\frac{1}{4}$ morgen, that being the limit fixed by law.

In the case of difficulties about division arising, the property is sold by auction.

The above-mentioned "Hofgüter" form an exception to the general rule as regards inheritance. This class of property descends to the youngest son, or in default of a son to the eldest daughter.

The inheriting farmer is bound to provide for his brothers and sisters according to a certain customary rate, namely, four-fifths of the capitalized value of the estate. These latter usually remain as servants on the farm.

Transfer of Land.—The transfer of land, whether by sale, gift, inheritance, or exchange, in order to be legally effected must be registered by the authorities of the Commune ("Gemende Rath") in what is called the "Grand Buch" or "Pfand Buch."

The State levies a tax on the purchase and sale of land ("Kauf accise") of 2½ per cent. of the purchase price (1½ kreutzers on the florin).

The purchaser has in general to pay this tax, as well as the small dues for registry.

Exemption from the tax is allowed when landed property is transferred from ancestors to their descendants, from husband to wife, or wife to husband; when inherited by a wife from a deceased husband, or husband from a deceased wife; when made over to public, benevolent, or educational institutions; when the consolidation of small holdings effected according to law gives rise to a change of ownership. If a claimant entitled to any property obtains the same by means of a forced sale by auction up to the amount of his claim.

Credit Institutions.—There are no special facilities afforded for raising loans upon landed properties either from Government or special public companies or banks aided by Government, it being altogether opposed to the principles of the Baden Government to afford State help to institutions of that kind. A variety of co-operative associations, however, exist in the country founded on the Schulze-Delitsch system, of which the great principle is that of self-help,—such as loans associations, credit unions, productive associations, consumption associations, savings banks, &c., all of which are very useful in promoting credit and general prosperity of the labouring classes.

The principles upon which such associations are formed, and which are to be met with everywhere in Germany, have been already so largely reported upon that I need not enter upon that subject here.

In spite of all that has been done, and is being done to aid the small farmer, he, nevertheless, frequently gets deeply into debt, especially those of them who have a strong propensity for speculation.

Many of these small farmers, impelled by an ardent desire to increase the size of their holdings, purchase land and trust to their skill and economy and to good harvests to enable them to pay off the purchase money within the stipulated period. If the harvests happen to turn out unfavourably, or the burden they have imposed upon themselves is too heavy, they soon find themselves in difficulty, and often in great distress. After a series of bad harvests, the bankruptcy of these farmers is by no means an uncommon occurrence.

The condition of the larger farmers and proprietors of the "Hofgüter" is, however, often not much better than that of the others, though the causes which operate in bringing them into that condition are not exactly the same.

The prosperity of both is, indeed, mainly dependent upon the result of the harvests; but the large farmer has to employ a number of hired labourers and assistants, and it not unfrequently happens that owing to a rise in the rate of wages, together with a diminution of the amount of work performed, he finds himself in a position of embarrassment and wretchedness out of which he cannot easily extricate himself.

Rate of Interest.—The usual rate of interest is 5 per cent.

Crops Cultivated.—The average cultivation of crops in the Grand Duchy from 1865 to 1688, was as follows:—

	Morgen.		Morgen.
Wheat	87,231	Hops	4,235
Spelt	237,013	Chicory	3,534
Rye	112,408	Beetroot	7,114
Barley	153,184	Turnips	49,343
Oats	136,847	Potatoes	202,433
Maize	7,214	Topinambur*	1,504
Mixed fruits	80,982	Clover	187,501
Peas, beans, &c. ("Halsenfrüchte")	9,818	Green fodder	10,088
Oleaginous crops	21,662	Buckwheat	1,584
Hemp	24,964	Millet	161
Flax	3,813	Cabbage and vegetables	7,301
Tobacco	20,110		

I inclose two statistical papers published by the Government, giving an account of the crops cultivated in the different districts of the country in 1868 and 1869.

Live Stock.—An account of the number and condition of the live stock in Baden may be seen in an elaborate Report issued by the Baden Government, and which accompanies this paper.

The cattle of the small farmer and middle man are fattened in stall. In summer they are fed on green fodder, in winter on hay, turnips, oats and potatoes. Grass lands are only met with in the mountains.

The larger farmers usually keep their own breeding bulls. The smaller cattle proprietors have recourse to the Commune where good bulls are maintained at the rate of one to eighty cows.

* Jerusalem artichokes.

The State exercises a strict supervision over the Communes in regard to the condition of their cattle.

Machinery.—Machines for cutting hay and roots as well as threshing machines, are used in aid of manual labour. Generally mowing machines have been introduced on trial, but have as yet made but little progress.

Female Labour.—Women are employed in all branches of agricultural labour, especially for watching the domestic animals.

Wages.—The daily wages of the agricultural labourer are:—

	Kr.	Fl. kr.	Average.
For men, without board	24 to 1	30 ..	48 kreutzers
For women, „	15 to 1	0 ..	36 „
For men, with board	12 to 1	0 ..	30 „
For women, „	5 to 0	36 ..	20 „

Emigration.—The emigration of hired day labourers is not very considerable, they generally wait until they have acquired a certain amount of property, and part of their children are dismissed from school.

In 1867, 2,386 peasants emigrated with 1,161,437 florins;

In 1868, 2,816 emigrants with 736,120 florins.

The above has reference only to the emigration recognized and often assisted by the State ("Amtbike Auswanderung"). Many emigrate secretly without giving up their nationality.

General Condition of Small Proprietors.

These proprietors usually live in villages adjacent to their properties. "Hofgüter" are, however, to be met with more or less in all parts of the country where the proprietor resides on his farm.

They are clad in woollen and cotton stuffs, inhabit solidly built houses, with windows, stoves, and chimneys. The sitting and bed-rooms are generally separate. The rooms contain wooden, mostly unstuffed furniture. Their food is bread, milk, potatoes, vegetables, salad, peas, beans, pork; occasionally beef or mutton.

The inhabitants of the Grand Duchy consume annually on an average each 50 lbs. of meat (therefore, about 1 lb. a week), and of this 29 lbs. are pork. Pork is especially the food of the country districts. In the vinegrowing parts, wine is the chief beverage. Cider and beer are also used. In the mountain districts, spirits. In some parts fermented liquors appear only occasionally on the peasant's table, in others again in profusion.

Coffee is much used, mixed with a preparation which the chicory manufacturers bring into the market under the name of "Surrogat." It consists of dried and pulverized pieces of carrots, beetroot, chicory root, and roasted rye.

This "Surrogat" is mixed in larger or smaller proportions with the coffee, and may be regarded as a staple article of food for the people both in the country and in the towns.

The mixture is boiled and drank with milk, with the addition sometimes of sugar. In hay making and harvest time, the peasants often take with them to the fields a cask containing a strong decoction of coffee and surrogat diluted with water, and bury it in the ground to keep it cool until required for use.

The small peasant proprietors do not differ from the larger proprietors in respect to their dwellings, clothing, mode of living, or education. Both enjoy the advantage of the same schools and instruction in their youth, and take part in the same way in all the affairs of public life. They cannot be said in any way to form a distinct class. On free days they may be seen working in company with the day labourers on the larger farms. At other times they are employed in the cultivation of such crops as hemp, tobacco, rape seed, beetroot, &c., on patches of land for which they pay a small rent; or in any labour or service which yields them some return, and thus by continuous and vigorous exertion, they often attain the object of their ambition—namely, to become large proprietors.

There is said to be a larger proportion of active and intelligent farmers among the cow peasants, as they are called ("Kuhbaueru"), that is those who employ cows for the tillage of their fields, than among the richer peasants. The cow peasants often live better and more economically than the others, especially when the latter are obliged to keep a number of servants and assistants.

There is, I believe, no doubt that since the revolution of 1848, there has been a great improvement in the houses of the peasants in their mode of living, and in the cultivation of the soil, and their present condition must, on the whole, be regarded as favourable in respect to their means and general well-being.

The views of statesmen and philosophers, as to the advantages of a large number of small peasant freeholders, are, as might be expected, very divergent.

The prevalent public opinion is that the system of small freeholds tends to promote the greater economical and moral prosperity of the people to raise the average standard of education, and to increase the national powers of defence and taxation.

It seems to be a generally established fact that the small farmers realize larger returns than the larger farmers do from the same number of acres, and the result is that large properties and large farms are disappearing, and being parcelled out among a number of small farmers. In fact, the price of landed properties is determined less by their intrinsic value than by the possibility of selling or letting them in small holdings.

Certain crops, such for instance as tobacco, are wholly unsuited to a system of "grand culture."

Dr. Mährlen, in his Treatise on the Taxation of Tobacco, says:—

"The cultivation of tobacco requires a great deal of labour, which labour is divided into more than twelve different branches, all of which demand constant supervision and care. The small farmer then avails himself of the energies of all his family, for even children can be employed in various minute operations."

He then goes on to say: "The same reasons which recommend the culture of tobacco to the small farmer deter the larger farmer from undertaking it. Even when the latter has got sufficient manure, labour is too costly, for he is obliged to employ strangers to perform it. It is only when he is able to raise the best and most valuable qualities, when he has at his disposal thoroughly competent planters, who plant his field by contract, and know how to treat the produce, that it can pay him to cultivate tobacco. Tobacco is a peculiar product, which is as little suitable for farming on a large scale, as garden or other produce requiring continuous superintendence and labour.

"There is nothing a large farmer has so much to dread in South Germany as a heavy wages account."

(B.)—Tenants and Sub-Tenants under Landlords.

Tenure.

The duration of leases is three, six, nine, twelve, fifteen, and eighteen years; the largest proportion nine to twelve years.

Sub-letting is generally admissible, if not specially forbidden by previous agreement.

When a lease is granted it is the usual practice for a landlord to enter into a contract with the tenant in which the duration of the lease is stipulated; if there is no such contract the law provides that the lease shall last for such a time as is necessary to enable the tenant to reap the full benefit of the land that he rents.

Thus on vineyard or pasture lands the period is fixed at one year; on arable lands for as long as the ordinary rotation of crops lasts.

There is no system by which a written agreement may be registered, nor is there any law or custom under which a tenant is considered as having a right to remain in occupation of his holding as long as he pays his rent, or to sell his interest in his farm.

Rent.

Rents are generally paid in money, and only occasionally in produce.

In the tobacco districts a system called "Antheilsbind" (the French métayer system) is usual. The proprietor of the land ploughs and dungs the field, the labourer furnishes the plants and performs all the necessary work in return for from one-third to one-half of the raw produce.

In the wine districts the labour is also sometimes remunerated by a fixed share in the wine produced.

Rents are generally regulated by competition. When small, the payments take place once a-year, on November 11, when more considerable twice a-year (February 2 and April 24).

The landlord has no power of raising the rent during the period of the lease or to evict the tenant by his own authority in case of non-payment or breach of covenant. The Courts of Law alone can give effect to the conditions of the lease.

The privileges of the landlord over other creditors are regulated by the Provincial Law which is a translation of the French "Code Civil."

Evictions.

The Provincial Law above mentioned determines the cases which justify the annulment of a lease ; but under all circumstances the sentence of a Judge in a Court of Law is necessary before the contract of lease can be cancelled.

Evictions are rare occurrences in Baden. When such an event does take place, it is generally owing to the tenant possessing too small an amount of capital to enable him properly to cultivate his farm, or to losses from cattle disease (*Pleuropneumonia exsudativa*).

Improvements.

Improvements (especially buildings) are executed by the landlord. It is the tenant's business to keep the buildings in proper repair. The mutual obligations of landlord and tenant in this respect are generally regulated in the Contract of Lease.

Before a lease is granted the tenant is usually required to show that he possesses an adequate amount of capital or to furnish security for the payment of rent.

When there is no agreement all the improvements which the tenant makes become the property of the landlord without the latter being bound to give any compensation. There is nothing of the nature of tenant right in this country.

The Government gives no assistance whatever directly or indirectly to tenants to enable them to contract loans.

Miscellaneous.

The relations between landlord and tenant are more the most part of a business nature. It is only on the property of the noble families that a sort of patriarchal relation still subsists, where the tenants have for generations occupied the same holdings.

Nothing has been done, or can be done, by Legislation to affect these relations, nor, as far as I know, is any such interference required for the better protection of the tenants.

The tenants cultivate their farms in exactly the same way as the small proprietors do; and do not otherwise differ from them in regard to their mode and standard of living, solvency, independence, or general circumstances and character.

The large farms generally produce better stock than the small ones. The "Hofgut" farmers breed frequently with their own bulls, and raise larger and finer cattle than the others.

The use of agricultural machines is not more extended among one class of farmers than another, but slowly gaining ground everywhere.

The annual rate of increase in the population among tenants as compared with that of small proprietors has not been precisely ascertained.

The tenants frequently emigrate, especially if they have families, and expect to invest their savings more advantageously in America, and make a better provision for their children.

Owing to the large demand for farms the rents have greatly risen, and the profits of the tenants are consequently small. In bad years they are frequently very much embarrassed, especially as the rape seed, on which they have generally depended for paying their rents, now yields very uncertain returns.

There is, however, no doubt that the land might be made to produce more than it does by deep ploughing, draining, drilling, the judicious use of artificial manure, &c., if the tenants possessed the capital, skill, and intelligence necessary for the pupose.

Redemption of Tithes, &c.—The tithes, dues, and various charges with which the land was at one time burdened, were all abolished by law during the period from 1833 to 1848, and compensation accorded to the landowners for the losses they thereby sustained.

The burdens were commuted for a capital sum, generally 16 to 18 times the amount of their annual value. The law further provided that this capital, of which the State undertook to discharge one-fifth, should be paid off in equal portions annually (shorter periods not being excluded), together with 4 per cent. interest during 25 years.

Much of this capital was paid up very rapidly, and the various landowners (mediatized Princes, private individuals, Corporations, foundations, schools, &c.) soon found themselves in possession of considerable sums of ready money, which they again invested in land, at a time when the price of land was low, and let it out to tenant farmers on terminable leases.

This is the origin of tenant farmers in Baden. The system, at any rate, works very well. I have been informed by several persons that these tenants are, as a body, the best farmers in the country, both as to intelligence and character. A statement of this kind will however, always be disputed, and I cannot vouch for its truth.

Copyholds.—It will be perceived from the above that any tenures resembling the copyholds of England, where the tenant is irremovable, are no longer possible in this country. All leases are terminable.

Accumulation of Land.—The action of the law is directed solely towards facilitating the consolidation of scattered patches of land belonging to the same proprietor, and lying in the same immediate vicinity, but has no reference to the accumulation or diminution of landed properties.

No. 10.

Mr. Gordon to the Earl of Clarendon.—(Received December 25.)

My Lord, *Stuttgardt, December 22, 1869.*

WITH reference to my despatch of the 18th instant, forwarding Mr. Baillie's Report on the tenure of land in the Grand Duchy of Baden, I have the honour to transmit herewith a supplementary paper on the tillage, husbandry, and rotation of crops in the Grand Duchy, which I have to-day received from Carlsruhe, and which Mr. Baillie was unable to get ready to be sent with his Report. In the paper now forwarded, Mr. Baillie gives a slight account of one part of the forest management in Baden.

I have, &c.

(Signed) G. J. R. GORDON.

Inclosure in No. 10.

Supplementary Report on Agriculture, Rotation of Crops, &c., in the Grand Duchy of Baden.

WITHIN the limits of those districts which are called "Gemarkungen," the land is frequently divided into a certain number of large fields, which in Baden bear the name of "Fluren," or "Felder."

This arrangement is not founded on property, but on ancient custom, and has reference solely to agriculture. Consequently, the "Fluren" are not distinguished by any permanent marks, or noticed in any map.

They do not contain kitchen gardens, orchards, forests, pasture lands, meadows, or vineyards, but only the land which has been under tillage from time immemorial; probably ever since the Germans first took possession of the country.

The land that has been more recently brought under the plough has been either added gradually to the different "Fluren," or cultivated apart from them.

The number of "Fluren" in which the arable land is divided varies considerably in the different "Gemarkungen." It ranges from two to eight; but what is called the "Dreifelder" system (two crops and fallow) predominates.

The "Fluren" are divided further into sections, which are usually bounded by high or cross-roads, streams, meadows, woods, fences, &c., and are designated by peculiar names. These now contain sub-divisions, which are called "Gewanne," an old word derived from the verb "wenden," that is, "Umwenden des Pflugs," the upturning of the soil by the plough.

The "Gewanne" may be recognized by the nearly parallel course of furrows on the different patches of land of which they consist. In well-ordered "Gemarkungen" each one of these "Gewanne" lies between two parallel cross-roads.

The division of the arable land into "Fluren" originated partly from the soil having been in old times held in common, partly from the danger of attack to which the farmers were often exposed in times of general commotion, and, above all, from the deficiency of country-roads.

The farmers of a "Gemarkung" cultivated the same crops simultaneously. They appeared in considerable numbers in the same locality, and were thus able to render assistance to one another in case of need. In the operations of the field they did not obstruct one another with their carts and teams, as they must necessarily have done in the absence of communication between the different fields, if each farmer had acted independently, and without any regard to what his neighbour was doing.

The system of cultivation in "Fluren" was, therefore, in former times an immense benefit. It obviated the necessity of legal enactments, and it afforded protection to the

crops when the fallows were under pasturage, for the pasture lands formed a connected whole, which the middle ages was sometimes enclosed with a hedge.

In many Communes this compulsory arrangement still subsists, and, singularly enough, often without causing any dissatisfaction; and where the means of communication are insufficient it cannot be changed.

The system has, however, long ceased to be a benefit. It is, on the contrary, one of the chief obstacles to the progress of agriculture in Baden.

The individual farmer cannot act with full freedom on his property, and take advantage as he might wish of the advance that has been made in agricultural science.

The cultivation of crops for fodder, such as clover, as others which yield a good return, improved manuring, the use of machines for economizing labour or seed, are therefore all much more neglected and retarded than they need be.

This bigoted attachment to a traditional system, the advantages of which belong to the past, is certainly a melancholy proof of the low and unenlightened condition of the agricultural population of this country.

The Legislature has, however, already taken the matter in hand, and a law has been passed providing that, whenever an adequate majority is in favour of field roads being made, the refractory minority shall be compelled to yield for the general advantage.

The cultivation of the soil is closely connected with the division in "Fluren." On every "Flur" it has been always the practice for the same crop to recur after a previously fixed number of years.

The rotation thus coincided originally exactly with the number of "Fluren," and this is still the case where the "Flur" system is in operation.

Indeed the old course of crops still continues with more or less variation even in those "Gemarkungen" where compulsion has long been done away with, and the farmer can act as he pleases.

It is therefore often possible to gather from the present course of crops in what way the old "Flur" system was formerly conducted.

On the simple "two-felder system" the agricultural surface was divided in two "Fluren." On the 1st the crop was corn, the 2nd was fallowed and used as pasture. A change took place every year; the fallowed "Flur" of the past year became the crop field of the current year, and *vice versâ*, thus the following rotation took place on each field,—

1st year, fallow (pasture); 2nd, corn; 3rd, fallow (pasture), and so on.

The corn crop accordingly occupied the half of the whole surface.

The simple two-felder husbandry is of Roman origin, and though the name still continues in some communes of the Palatinate, the thing itself has long since disappeared.

The following example of the course adopted on a property of 9 morgen of arable land in the Palatinate bears distinct traces of its origin in the above system :—

Crop Field.		*Fallowed Field.*	
¼	morgen Lucerne.	¼	morgen Lucerne.
2½	„ Winter Corn.	1¼	„ Tobacco.
1¼	„ Barley.	1	„ Beetroot.
½	„ Potatoes.	1	„ Clover.
		½	„ Hemp and Rapeseed.
		½	„ Potatoes.
4½	morgen.	4½	morgen.

The simple "Dreifelder" system (two crops and fallow) divided the agricultural surface into three "Fluren." The 1st was used as pasture (fallow); the 2nd, winter corn (winter "Flur"); the 3rd, summer corn (summer "Flur").

The crops and the "Fluren" were changed every year, so that the following alternation took place on the same field,—

1st year, fallow (pasture); 2nd, winter corn; 3rd, summer; 4th, fallow (pasture).

Three years ended the alternation, and on two-thirds of the surface a corn crop was annually raised.

This simple three-felder system is of old German origin, and is no longer met-with. The system actually in operation is the improved three-felder husbandry ("Verbesserte dreifelder Wirthschaft").

The same division into fluren remains, but the fallow is either manured or cultivated. It is then called "besämmerte Brache." The crops used for this purpose ("Brochfrüchte") are peas, linseed, beans, potatoes, mangel-wurzel, hemp, flax, poppies, tobacco, &c.; also fodder crops, clover, which is sown with the summer corn, vetches, &c.

The alternation of this system is therefore,—

1st year, winter corn; 2nd, summer; 3rd, clover, or some fallow crop; 4th, winter corn, &c.

The introduction of clover about 100 years ago led gradually to the abandonment of the simple three-felder husbandry. As the raw produce of the soil improved in price it appeared irrational to leave one-third of the soil untilled.

As the clover crop did not always turn out well every three years it became necessary to add other produce. Thus arose a more complicated succession of crops, extending over a greater number of years, partly in connexion with the "Flur" system and partly separate from it.

By dividing each "Flur," the transition to a 6 or a 9 "Felder Wirthschaft" was easily effected.

6. "*Felder Wirthschaft.*"

1. Tobacco or mangel-wurzel, manured.	4. Clover, manured for spelt.
2. Spelt or rye.	5. Spelt or rye. Stubble beetroot.
3. Barley.	6. Potatoes or mangel-wurzel.

9. "*Felder Wirthschaft.*"

1. Tobacco, manured.	6. Spelt.
2. Spelt or rye.	7. Potatoes.
3. Mangel-wurzel or potatoes.	8. Barley.
4. Barley	9. Oats.
5. Clover, manured for spelt.	

The following are examples of the altenation of crops on the 4 and 5 "Felder Wirthschaft":—

1. Rapeseed or wheat, spelt or rye.	3. Barley or oats.
2. Potatoes or beetroot.	4. Clover or green fodder, hemp, &c.
1. Rapeseed, spelt, or rye.	4. Clover.
2. Potatoes or beetroot.	5. Clover.
3. Barley.	
1. Tobacco or mangel-wurzel.	4. Spelt, stubble beetroot.
2. Barley.	5. Potatoes.
3. Clover.	

On the larger properties the following alteration is often adopted:—

1. Green fodder, half fallowed.	5. Barley.
2. Rapeseed.	6. Clover.
3. Spelt or wheat.	7. Oats.
4. Potatoes, mangel wurzel.	

Free husbandry is being rapidly extended without "Fluren," and without a fixed succession of crops. The farmer selecting the crops which promise the best return taking into consideration the soil, the weather, the price of raw produce, and his capital, and amount of available labour.

It remains only now to mention the forest husbandry called "Wald Feld Wirthschaft," in its various forms:—

1. In the valley of the Rhine it is the practice to plant those portions of the forests where the timber has been cut down, with pines (*Pinus silvestris*), oak and beach, on strips 4½ feet in breadth. Between these strips potatoes and rye are grown on the soil for a period of four years.

2. On the wooded hill sides of the Odenwald, it is the practice to cut down the oak wood of fourteen or sixteen years growth, to strip off and sell the bark, to burn the stems, and during two years, to raise crops of flax, rye, and buckwheat on the soil which has been cleared. Plantations are afterwards laid down, and after fourteen years the same thing again takes place.

3. On the steep hill sides of the Black Forest, the old pastures, or the cleared wood land, is burnt with the underwood, and numerous weed, especially the *Spartium scoparium.* The ashes are scattered over the whole surface, which is sown with rye, buckwheat, and "Ein korn." Potatoes follow in the second year, and in the third oats. The soil is then again laid down in wood or pasture.

This last branch of farming forms the passage to the "Wild Felder Wirthschaft" in the high districts of the Black Forest. There the pasture-land is broken up after a period of twelve or fifteen years, and sown with rye, potatoes, and flax for two years.

No. 11.

Sir A. Paget to the Earl of Clarendon.—(*Received December* 1.)

My Lord, *Florence, November* 25, 1869.

WITH reference to your Lordship's circular of the 26th August, I have the honour to transmit herewith Mr. Bonham's replies to the queries inclosed therein, and communicated to him, together with a copy of the circular, by Mr. Herries, as reported in his despatch of the 6th of September.

Mr. Bonham, in forwarding to me these replies, expressed regret that he had been unable to draw a more complete Report, in consequence of an attack of illness, which, for some weeks, had incapacitated him from giving assiduous attention to business.

Your Lordship's queries were long ago submitted to the examination of competent persons in different parts of Italy; but owing to the deficiency of statistics, and to the great variety of usages still prevailing, it has not yet been found possible to collect all the information required.

Much time and labour must still be devoted to the inquiry, before it can give any satisfactory result; and under these circumstances I have thought it advisable to send Mr. Bonham's statement to your Lordship in a substantive form, rather than leave it to be embodied in a general Report.

I have, &c.
(Signed) A. PAGET.

Inclosure in No. 11.

Report on the Tenure of Land in Italy.

Name of Country.—Italy, southern provinces.
Population.—About 6,000,000.
Religions.—Roman Catholic.
Industrial Pursuits.—Chiefly agricultural.

LAND OCCUPATION.

The land is principally occupied by tenants under proprietors, to a far less extent by small proprietors, and still less by sub-tenants under intermediate tenants; the relative proportions of these different systems cannot be ascertained, but there can be no doubt the main occupation is by tenants under proprietors.

(A.)—SMALL PROPRIETORS.

1. Varies in different provinces; 10 to 60 acres in the provinces near Naples; generally not exceeding 8 to 10 acres in the Calabrias, and many even smaller holdings on the Adriatic coast. These small properties are chiefly in the vicinity of towns, and frequently intersected by other properties.

2. The present law which regulates the descent and division of landed property on death establishes, when there is no will, an equal division amongst the children, without reference to sex. A landlord having children, may dispose, by will, of one-half of his property; any amount, however, which during his life he may have alienated by deed of gift, either to a stranger, or indirectly to a child, is reckoned as portion of the half of which he may dispose; the remaining half must be divided equally amongst the children; if he has no children or parents living, he may bequeath his property as he chooses; if if parents living, one-third is reserved, the other two-thirds being free.

3. The sale, transfer, exchange, or division of properties is effected by public notarial act; this act must be attested by, and deposited with, a notary who retains the original in his archives, and gives a legal and authentic copy: it must also be registered in the Office of Registry and Stamps ("Registro e Bollo") and the tax for registration of sale and transfer 3·30 per cent. paid; it must also be inscribed in the register of mortgages. The total registering, notarial and office charges on the sale and transfer of of a property of the value of 50,000 lire (2,000*l.*), would be 2,640 lire (106*l*), or about 5 per cent. on the value; and this amount, viz. 5 per cent. on the value, may be considered the average expense on sale of property in these provinces.

4. There are no special facilities for obtaining advances or loans on property.

5. It is calculated that fully one-third of the landed property in these provinces is mortgaged; the rate of interest on mortgage is from 6 to 12 per cent.

6. Every chief town of a province has an office for the registry of mortgages. The system of registration is very simple; the notarial act of mortgage, with a request for registry on stamped paper is sent to the Registrar, and entered in a register kept for the purpose, with ample indexes for reference; the number, date, and page at which registered is then indorsed on the mortgage deed to facilitate reference, and the deed returned to the owner. The charges for registration amount to about $\frac{1}{2}$ per cent., exclusive of stamps of small amount.

7. Much of the most valuable cultivation in these provinces is arboreal, that is to say, olives, almonds, carrouba beans, figs, oranges, lemons, and grapes, also mulberry trees. In many parts the cultivated lands are most productive, giving a rental of 6*l.* to 8*l.* per acre, and yielding two crops a-year, exclusive of the produce of the trees and vines. The ground crops comprise wheat, flax, hemp, maize, oats, beans, cotton, &c. The general implement of husbandry is a large hoe. Small proprietors own very few cattle beyond what may be strictly required for the cultivation of the land, and perhaps a few goats or sheep; these pick up what they can get in olive plantations, by roadsides, or elsewhere, and are a good deal fed on vine leaves and fig leaves.

8. Little machinery is used in aid of manual labour; during the last few years some thrashing-machines have been introduced. Many hired labourers are employed. Labour varies so much, according to the crop produced, that I can obtain no reliable estimate. Much work is done by women for sowing, gathering olives, grapes, figs, &c. Agricultural labourers' wages vary from 1 lira to 1 lira 50 centimes per day; women 50 centimes to 60 centimes. In small farms they do not often live with their employers. In addition to wages, however, they frequently have a meal after work. In large farms labourers reside on the farms, and receive from 8 to 10 francs, about three pecks of wheat, and the same of beans, a-month; also an extra franc per month for salt and oil; they are also usually allowed to cultivate a small piece of ground on their own account, which may yield them from 1 to 2 quarters of wheat. I am told that one man is employed for 6 acres in large farms; but, as before stated, the number of labourers employed is so variously reported, that I cannot fix an average.

9. There is no emigration.

10. They usually live in the adjacent villages, not on their farms.

11. Except in the Calabrias they are tolerably well housed, fed, and clad; live on wheat or maize, bread, salt, fish, vegetables, pasta (maccaroni, &c.), and fruit—fresh meat once or twice a week. They are coarse and rude in their manners and habits—are looked upon as small gentlemen ("galantuomini"). In the Calabrias they are reported as being much worse off. Mr. Albani, Vice-Consul at Cotrone, in his Report states:—"In truth, it may be said, they are badly lodged, fed, and clothed. The small gains which they derive from their very small properties are barely sufficient for common necessaries, having furthermore to apply these gains before everything else to the payment of the numerous Government imposts, which they barely suffice to do. The class in question, for their own actual subsistence, is obliged to contract debts, which in a short space of time absorb the whole of their little properties, and we see these small proprietors fall into distress and disappear."

12. With the exception of the Province of Naples, which has a large town population, and of Basilicata, Capitanata, and Terra di Otranto, which are thinly populated, the southern provinces comprise an area of 15,212 square miles, or about 9,700,000 acres, and have a population of about 4,700,000, or, on an average, one inhabitant to every $2\frac{1}{16}$ acres. In these provinces there are, of course, many towns whose population is included in this estimate, but no one town in them has a population much if at all exceeding 30,000.

As to the annual comparative rate of increase amongst different classes of the population, no statistics are obtainable to show it.

13. As one rarely or ever hears any remark on the subject of land tenure, it may be concluded there is no particular feeling against the system which exists.

(B.)—Tenants and Sub-Tenants under Landlords.

Tenure.

1. Varies greatly—from 2 to 200 and 300, and even occasionally to 1,000 acres.

2. Almost always by written agreement. Duration 4 to 6, very rarely 8 years. In small holdings the principal conditions in the lease bind the tenant to cultivate carefully and properly, to pay the rent at the stipulated periods, to give up the arable land in the same condition in which he received it, to replace the trees which may die or be blown down, to cut none without the permission of the proprietor. The number of fruit trees

and vines is counted and recorded in the lease, if found deficient at the termination of the lease the tenant pays for those missing—if more, the landlord pays for them. In the case of large farms the landlord generally stocks the farm, supplies farming implements and cattle, seed and manure to the in-coming tenant, who enters on possession without investing a farthing of capital, but, on the other hand, is bound to give security either by mortgage on property of his own, or by guarantee of some thoroughly responsible party as well for the value of the whole of the stock as for the rent, during the period of his tenancy, and that he will give back stock equal in value to what he received. Sub-tenancies are assignable by the tenant, unless specially forbidden in the lease, but they usually are forbidden.

3. The tenancy is almost always by written agreement, rarely verbal, but in either case the agreement, whether written or verbal, must within a certain period be declared and registered at the Office of Registry, and stamps, without which formality, legal redress if requisite cannot be obtained, save by payment of double tax and a fine.

4. The agreement or lease must be registered under a penalty. It frequently occurs, however, that leases are not registered but as above stated in such cases, legal action cannot be invoked in their support unless double tax and fines are paid. The tax for registration is small, and is paid at the Office of Registry and Stamps—in fact, every transaction connected with land, sale, transfer, gift, exchange, division, lease, or mortgage, must be registered, so that the ownership, value, and incumbrances on every acre of land in the Province can be ascertained at the Offices of Registry and Stamps, and of mortgages which exist in the chief town of every Province.

5. There is no law or custom under which a tenant is considered as having a right to remain in occupation after the termination of his lease, whether he may be willing to continue paying the covenanted rent or not.

6. There is no law or custom under which a tenant is considered as having a right to sell his interest in his farm to anyone—either with or without the consent of the landlord—such a thing is unknown.

Rent.

1. In almost all cases, payment to proprietors is made by a fixed amount of money, rarely in kind; in still more rare cases, the Mezzadia or Colonia, as in Lombardy, exists in these provinces, when the landlord gives the land and certain implements, the tenant finds the labour and the produce is divided between them in a ratio fixed in the agreement.

2. As regards property belonging to minors, the amount of rent is settled by public auction; in all other cases it is a matter of perfectly free arrangement and agreement between the parties, there is no law or custom which fetters the landlord as to the amount of rent he may ask, and he naturally makes the best bargain he can. Rent is usually paid half-yearly, sometimes yearly—there is no hanging gale.

3. The landlord has unlimited power in cases of non-payment of rent, or non-observance of the stipulated covenants to proceed by due course of law to enforce payment or obtain the eviction of the tenant, of course he cannot raise the rent during the continuance of a lease.

4. The respective rights of the tenant and landlord are defined in the lease; in case of non-payment for infraction of covenants, recourse is had to the Prætors Court of the district, if the sum in dispute or question is under 1,700 lire (68*l.*), if above that sum, to the Civil Court of the Province; the Court hears the case and decides; either party can appeal to these Courts. The landlord has privilege over other creditors as far as regards produce on the land, farming implements, and stock, not on other property.

Evictions.

1. By proceedings in the Prætors or Civil Court, as the case may be, a citation is served on the tenant by an officer of the Court calling on him to appear on such a day at such a place, before the Judge of the district, or of the civil tribunal to hear himself condemned for such and such reasons, viz: non-payment of rent, non-observance of covenants, &c., to quit the land he occupies, and failing to do so, to be evicted by force. The case is heard on the day appointed, the tenant either himself or by his counsel adduces his reasons in opposition and the Court decides; if he pleads, and proves his plea, that non-payment has been occasioned by adverse or accidental circumstances, he may, at the discretion of the Court, obtain a short term to pay in, and if payment is then made, eviction does not follow, or he may be condemned, and the eviction is carried out by the order and the officers of the Court.

2. Evictions are very rare indeed.

Improvements.

1. All are done by the landlord; he is bound to give over the buildings in a habitable state, and to maintain them during the tenancy in a condition to render them fit for the purposes for which they were intended.

2. If by tenant he has no security.

3. The law recognizes no absolute right of compensation to the tenant for any improvements not specified in the lease. Should a tenant have erected buildings, planted fruit trees, or made other improvements, it is in the option of the landlord on the expiration of the lease to retain such improvements, in which case he must pay for them either on an estimate of the cost of materials and labour employed, or of the additional value given to the property, at his option; or he may peremptorily call on the tenant to remove them, which he must do at his own cost and charges; in the former case the value of the improvements is determined by surveyors appointed by the Court, unless an amicable arrangement is come to between the parties,

4. Any disputes on the termination of a lease as to the buildings or land being in a better or worse state than covenanted in the lease, are usually referred to two valuers, one named by each side.

5. Tenants have no special facilities for raising loans for improvement of their farms, or for other purposes.

Miscellaneous.

1. The relations between landlords and tenants are usually friendly; no legislative interference is required.

2. The mode of cultivation by tenants on small holdings differs in no respect from that of small proprietors; their mode and standard of living is inferior to that of small proprietors; they live very frugally; fresh meat probably twice a year—Christmas and Easter. Their existence depends on the characters, if bad no one will give them a farm. Their social position is inferior to that of small proprietors, but in probity and good faith they are said to be superior. As respects tenants holding large farms they are a different class, usually possessing some amount of landed property of their own, but are a rough set, and often uneducated.

3. There are no statistics within my reach which enable me to form any estimate as to the comparative increase in the population among small proprietors, tenants or peasantry; large families appear to be the rule in all cases.

4. There is no emigration.

5. There is no expression whatever of public opinion on the subject.

6 and 7. The Legislature has not interfered in any way either to enforce the creation of freeholds or tenancies by proprietors, or the granting of leases. The proprietors are absolute owners of their lands.

8. There is no expression of public opinion on the subject.

9. The Government have taken no steps to create or increase the number of owners or freeholders.

10. Tenants receive no assistance by law, public credit, or otherwise. There is great desire amongst them to possess land which the numerous sales of church and other mortmain property in small lots and payment by instalments enable them to attain.

11. The laws in force tend in every way to favour the dispersion of the land.

Copyhold.

There are two description of tenures in these provinces which much resemble copyholds. One of persons called "Censuari," who in times gone by had received a grant of land in perpetuity, subject to a small annual quit-rent ("censo"), subject also, in case of sale, to a fine on admission of the new holder, in case of failure, to pay the stipulated rent for three years, the lord may by legal process enter in possession of the land; the other called "Decimari," who are held to pay a tenth of the actual produce in kind to the lord. These copyholders are now allowed to enfranchise on payment at a fixed rate, and the system is gradually disappearing; in some parts, however, it still exists to some extent, especially in small holdings; it is unpopular, being looked upon as a remnant of feudalism.

Naples, November 6, 1869.

Consul-General.

No. 12.

Mr. Lumley to the Earl of Clarendon.—(*Received December* 13.)

My Lord, *Brussels, December* 12, 1869.

I HAVE the honour to transmit herewith to your Lordship the Report on the land tenure in Belgium, which has been drawn up by Mr. Wyndham, Second Secretary of Her Majesty's Legation at Brussels, in accordance with the instructions conveyed to me in your Lordship's Circular despatch of the 26th August.

The information contained in this able and interesting Report which Mr. Wyndham has derived from personal intercourse with persons of all classes connected with agriculture in this country, is so complete that it dispenses me from any observations on the subject of which it treats; but I may be permitted to call your Lordship's particular attention to those portions of this paper* which relate to the condition of the peasant proprietors in the Pays de Waes, to the very summary process of eviction which exists in this country, to the extraordinary extent to which the truck system is enforced by small proprietors upon their tenants, and to the means adopted by the Belgian Government for the suppression of agrarian outrages, very similar to those which are unfortunately so frequent in Ireland.

I have, &c.

(Signed) J. SAVILE LUMLEY.

Inclosure in No. 12.

Report respecting Tenure of Land in Belgium.

BELGIUM is divided into nine provinces.

The superficial area of Belgium is, according to the cadastre or official map of the country, 2,945,539 hectares.†

The first census distinguishing between those persons employed in agriculture and those engaged in other pursuits was taken in 1846, and as this census gives a very clear and succinct account of the state of agriculture in Belgium, comprising much information not given in the last-published census taken in 1856, I have selected statistics from both of these documents, and considering that the number of the agricultural population has remained almost stationary during those ten years, this may, I think, be considered as conveying as correct a view as can well be obtained of the agricultural status of Belgium.

The last census taken in 1866 has not yet been published, and I have endeavoured in vain to obtain detailed information as to its results, but I am assured upon good authority that the diminution in the agricultural population will probably be more remarkable than in the period between 1846 and 1856.

The commercial administrations, however, are obliged for electoral purposes to draw up and furnish each year a Report to the Minister of the Interior of the amount of population in their respective communes throughout the Kingdom. According to the last Report, that of 1867, the total population of the kingdom amounted to 4,827,833. These communial Reports do not, however, classify the population according to their various employments.

In 1846 the total population amounted to 4,337,196; in 1856 to 4,529,560. In 1846 the number of persons to the square kilometre (100 hectares in extent) amounted to 147; in 1856 to 154.

The agricultural population had slightly diminished; it amounted in 1846 (counting from the age of 12 years) to 1,083,601, and in 1856 to 1,062,115.

In 1846 the extent of productive lands (less woods and forests) amounted to 1,793,160 hectares, the greater portion of which was in the hands of tenants; out of 100 hectares tenants held 65·78 per cent., whilst owners only cultivated 34·22 per cent. The amount in the hands of tenants (not counting woods and waste lands) was about 1,179,583 hectares, while that in the hands of owners amounted to 613,575 hectares.

In 1856 the total amount of productive land was 1,830,516 hectares, 1,202,224 hectares of which were in the hands of tenants, while 628,291 hectares were cultivated by proprietors.

The total amount of land estimated as being in the hands of Belgians themselves amounted in 1846 to 2,603,036 hectares (woods, &c., included), 1,423,453 of which were in the hands of owners, and, as above stated, 1,179,583 in the hands of tenants. Hence

* See Mr. Lumley's despatches of the 18th of December, 1869, and his despatches of the 8th and 9th of January, 1870, in Part II of Land Tenure Reports.

† The hectare contains 2 acres 1 rood 3½ perches.

it results that the bulk of the land in the hands of owners consisted of wood-lands wastes, &c.

I annex a Table, showing the proportion of lands cultivated by tenants, and that cultivated by owners in the respective provinces of Belgium in 1856.

(From Official Census of 1856, published in 1862.)

Provinces.	Superficial Extent, according to the "Cadastre," 1860.	Extent of Productive Lands (less Woods and Waste Lands).		
		Cultivated by Owners, or those entitled to Usufruct.	By Tenants.	Total.
	Hectares a. c.	Hectares a. c.	Hectares a. c.	Hectares a. c.
Antwerp	283.176 18 31	38,503 83 0	103,803 91 0	142.307 74 0
Brabant	328.296 24 34	78,147 52 0	180 841 24 0	258,988 76 0
Flanders, West	323,473 28 40	36,421 11 0	229,523 42 0	266,014 53 0
Flanders, East	299,996 36 72	57,008 8 0	171,375 11 0	228,383 19 0
Hainault	372,179 55 98	98,162 42 0	177,050 50 0	275,212 92 0
Liege	289,390 21 78	67,138 90 0	113,335 70 0	180,474 60 0
Limburg	241,237 45 28	57,473 86 0	68,482 16 0	125,956 2 0
Luxemburg	441,765 5 48	110,191 16 0	35,024 78 0	145,215 94 0
Namur	366,024 65 15	85,174 76 0	122.788 1 0	207,962 77 0
The Kingdom	2,945,539 1 44	628,291 64 0	1,202,224 83 0	1,830,516 47 0

The agricultural population was classed approximatively in 1846 as follows:—

Farmers (including their families).

Male	550,567
Female	356,008
Total	906,575

Servants or Labourers.

Male	107,303
Female	69,723
Total	177,026

This gives 80 farmers ("exploitants") to every 100 productive hectares (the number of hectares, as already stated, being 1,793,160), and 10 servants or labourers ("domestiques") to every 100 hectares.

The proportion of women to men employed in agriculture was throughout the kingdom to the population, as follows:—

1. Under the head of farmers ("exploitants"), 65 per cent.

2. Under the head of servants, 65 per cent.; and under that of day labourers, 53 per cent.

The average of the three categories united, is 61 per cent. Out of the 906,575 persons classed in the category of farmers ("exploitants"), 52,550 are owners or tenants; of this number about 119,312 are the owners of all the land they cultivate; 81,914 are owners of half those lands; 234,960 are tenants of the whole of those lands; and 136,360 are tenants of more than half of the lands they cultivate.

On examining the average extent of the land cultivated by the above-mentioned number of farmers (572,550), it results, that there are 247,551 whose farms or holdings do not exceed 50 acres; and that the number of those who cultivate less than 1 hectare, exceed by 63,378 those who cultivate a larger extent of land.

To illustrate still more clearly to what extent land is divided in Belgium, it may be well to mention, that out of every 100 farmers, 43·24 per cent. cultivate less than 50 acres, 12·30 per cent. less than 1 hectare, and 28·99 per cent. land not exceeding 5 hectares; that 7·47 per cent. cultivate between 5 and 10 hectares; and that the number of persons cultivating more than 10 hectares, is only 8 per cent.

Taken under the head of owners, some of whom also farm land in the capacity of tenants, there were, in 1846, 337,586 owners, and 234,964 tenants: these were divided amongst the different provinces as follows:—

Provinces.	Owners.	Tenants.
Antwerp	21.063	26,872
Brabant	54,109	29,021
West Flanders	19,705	58 793
East Flanders	45.547	42,758
Hainault	68,230	37,747
Liege	36,897	18,450
Limburg	24.207	7,963
Luxemburg	31,675	4.569
Namur	36,153	8,791
The Kingdom Total	337,586	234,964

Considering those persons classed as owners, apart from those classed as tenants, they may be divided under three heads with reference to the amount of land they cultivate, viz., 1st, those who cultivate less than 1 hectare, number 149,310, or 44 per cent.; 2nd, those who cultivate from 1 to 5 hectares, number 122,603, or 36 per cent.; and 3rd, those cultivating more than 5 hectares, number 65,673, or 19 per cent. Taken according to provinces, they are divided as follows. Out of every 100 owners (or part proprietors) there are:—

In the Province of—	Cultivating less than 1 hectare.	From 1 to 5 hectares.	More than 5 hectares.
Antwerp	37·25	32·85	29·90
Brabant	42·27	41·64	16·09
West Flanders	49·62	27·60	22·78
East Flanders	40·32	40·28	19·40
Hainault	55·93	29·74	14·33
Liege	52·22	32·01	15·77
Limburg	34·15	37·08	28·77
Luxemburg	24·82	45·83	29·35
Namur	46·72	38·06	15·22
The Kingdom	44·23	36·32	19·45

Further, I find that the subdivision of land is so great in Belgium, that out of 100 farms ("exploitations"), only 15·47 per cent. exceeded 5 hectares in extent, and scarcely 3 per cent. amounted to as much as 20 hectares; and that farms of over 50 hectares, were only found in the proportion of 75 to 10,000. The average size of holdings, comprising woods and wastes, was about 4 hectares 50 ares; and deducting woodlands and wastes, their average size was 3 hectares 13 ares.

The smallest holdings are in the Province of East Flanders, being on an average 2 hectares 76 ares each; while the largest holdings are in Luxemburg, averaging 11 hectares 35 ares.

The Report of 1856 gives no detailed account of the subdivision of the land, but it may be reasonably supposed, considering the law regulating landed property, that the subdivision is still greater than in 1846, and still greater at the present date than it was in 1856.

The following Table gives the agricultural population of Belgium in 1856:—

(From Official Census of 1856, published in 1862.)

Provinces.	Owners, Cultivators, or Farmers, Stewards or Farm Bailiffs.		Gardeners, Horticulturists Arborists, Vine Growers, &c.		Shepherds and Graziers.		Labourers and Farm Servants.		Wood-men, Charcoal Burners, Broom Makers, Gamekeepers.		Total, according to Sex.		General Total.
	Male.	Female.	Male.	Female	Male.	Female	Male.	Female.	Male.	Female	Male.	Female.	
Antwerp	29,281	19,465	1,744	457	137	12	40,512	26,489	117	18	71,791	46,441	118,232
Brabant	61,936	18,349	1,381	67	267	2	52,244	28,935	573	6	116,401	47,359	163,760
West Flanders.	32,617	28,132	1,727	546	304	4	63,957	39,139	673	137	99.278	67,958	167,236
East Flanders.	79,207	35,812	1,478	360	432	..	63,174	31,802	980	1	145,271	67,975	213,246
Hainault	31,302	9,981	1,215	19	1,167	57	62,529	45,570	2,342	125	98,555	55,752	154,307
Liege	16,372	3,031	761	10	408	1	37,266	21,485	246	5	55,053	24,532	79,585
Limburg	15,309	2,207	185	3	937	269	25,564	15,621	187	3	42,182	18,103	60,285
Luxemburg ..	19,223	4,671	62	..	532	46	14,445	7,227	580	1	34,842	11,945	46,787
Namur.....	15,226	982	308	..	627	5	28,621	11,847	1,059	2	45,841	12,836	58,677
	300,473	122,630	8,861	1,462	4,811	396	388,312	228,115	6,757	298	709,214	352,901	1,062,115
Total	423,103		10,323		5,207		616,427		7,055		1,062,115		

This Table shows that about 25 per cent. of the total population of Belgium was in 1856 employed in agriculture. Of the 1,062,155 individuals forming the agricultural

population, about five-twelfths were owners and farmers and seven-twelfths farm labourers, servants, &c.; one-third were females. This average of 25 per cent. differs in various provinces—in the Province of Liége, for instance, only 16 per cent.; in the Provinces of Hainault, Brabant, and Namur, 20, 21, and 22 per cent.; in Luxemburg, 24 per cent.; in the two Flanders and Antwerp, 27 and 28 per cent.; and in Limburg, 32 per cent. were employed in agriculture.

It will be observed that the census of 1856 shows a diminution in the agricultural population of 21,486, this decrease is so small that it is perhaps hardly worthy of notice. I endeavoured, however, to obtain some reason for its cause. It is attributed to the increased use of machinery in agriculture, and to the attraction of superior profits which the labourer can obtain in mining and industrial occupations; in some of the late communal reports which I have examined, I have found, and in parts of the country which I have visited, I have heard complaints of the present and increasing difficulty of obtaining farm labourers.

The above-mentioned diminution can in no way be attributed to emigration, which can scarcely be said to exist, there being at present sufficient outlet for any surplus of the agricultural population in manufacturing, mining, and other industrial pursuits. If I remember rightly, there were found to be, according to the last census taken in the United States of America, only 6,000 Belgians residing in that vast Republic.

According to the official Report of 1856, the number of persons engaged in other than agricultural pursuits is Belgium was as follows:—

Working in mines and quarries	73,292
Medal works	58,657
Glass works	6,012
Flax and hemp works	199,779
Wool	22,044
Cotton	24,746
Silk ("sétifére")	4,486
In tanyards, carriage building, &c.	30,021
In manufacturing articles of food	45,146
Ditto, clothing	252,517
Ditto, building	108,418
Furnishing and decorating	16.167
Various trades, such as printing, &c.	25,662
Engaged in commerce	156,803
Liberal professions	67,511
Public officers, Customs officers, police, &c. ("Force Publique")	36,106
Land owners, funded proprietors, persons enjoying pensions	50,314
Domestic servants	86,974
Persons without profession, including women and children*	2,202,790

The non-agricultural population has increased by a third more than the agricultural population during the period between 1846 and 1856.

In the year 1860 there were in Belgium eighty-six towns and 2,452 rural communes.

The Roman Catholic religion is the religion of the mass of the population; persons of other religious denominations forming a minority of 2·38 per 1,000.

Under the Dutch Government education was compulsory, but on the separation of Belgium from Holland, the Belgian authorities abolished the compulsory system, and education, which was making steady progress, has since 1830 made but slight advance. Many are the complaints of the ignorance of the lower classes, and many the complaints of the shortcoming of the education given in the purely ecclesiastical schools, and of the frequent opposition raised by the clergy to children attending schools where the laity claim a certain right of interference.

Moreover, with regard to the condition in this respect of the agricultural class in particular, the extreme subdivision of the land amongst peasants, some as owners, some as tenants, who, both young and old, are forced to continuous toil in order to eke out an existence, is naturally a serious impediment to educational progress in the rural districts.

In the official Report on Trade and Commerce of the district of St. Nicholas, a district which comprises the greater portion of the "Pays de Waes," where the land is extremely subdivided, it is stated that the number of children in 1868 who frequented the communal schools amounted to 7,934, viz., 1,357 from the town of St. Nicholas, out of a population of 23,694; 1,024 from the town of Lakeren, out of a population of 17,464; and 5,553 out of twenty-seven rural communes, having a total population of 86,141.

* Women and children are employed in mines.

It is stated that "although certain localities, and especially the town of Lakeren, co-operate actively in propagating literary instruction, the intellectual development of our working classes might be greater than it is. The necessity of employing children from their tenderest age in lucrative occupations generally obliges the parents to dispense with the education granted gratuitously by public societies."

The Report of the Arrondissement of Roulers, in West Flanders, also expresses similar regrets.

Laveleye, in his work on "Rural Economy in Belgium," remarks on the effects of subdivision of land on education, as follows:—

"The subdivision of land is not quité an ideal to propose to modern society, for it demands of man redoubled exertion and labour but little compatible with the development of his intellectual faculties, but it can be affirmed that up to this time the results in the Flanders have proved advantageous, at least as far as production and rents are concerned."

I fear I have travelled, for the present, too far into what may be looked upon as being only results of the subdivision of land, neglecting the conditions themselves which govern land in Belgium, and which I will now endeavour to state.

Since the French Revolution feudal rights have ceased to exist in Belgium, and no tenure resembling our copyhold system exists.

All property is subject to the same law. Heirs or representatives are either legal or testamentary.*

When the deceased leaves relations in a direct line (either descendants or ascendants) the law admits of no other heirs or successors.

Legatees or devisees in this case are allowed, but the law prohibits a person to dispose by deed of gift or by will, of all his estate or goods, to the prejudice either of his descendants or ascendants.

A person in giving or bequeathing his property can only dispose of a portion. That portion which the law reserves for the descendants and ascendants is termed the reserve—"La réserve." That portion of which a person may dispose is termed the disposable portion—"La quotité dispossible." The reserve and the disposable portions are fixed by Articles 913, 914, 915, 1,094, and 1,098 of the Code Civil.

When there are neither descendants or ascendants the person may dispose of all his property by will (Article 916 of the Code Civil).

In a case in which legatees or devisees become possessed of the whole of the property they are considered in every respect as the heirs or representatives of the deceased. If there are legal heirs or representatives they succeed as follows:—

In accordance with Articles 731 and 749 of the Code Civil, namely, first children or descendants, without distinction of sex or primogeniture, they succeed in equal portions, and ("par tête") *per capita*, when they are all in the direct line. If there are no descendants in the direct line those next of kin succeed (Article 745 of the Code Civil).

In default of children and of descendents, the succession goes first to the father and mother, brothers, sisters, &c.

Collateral branches are admitted to succeed to the twelfth degree; in default of collateral relations to the twelfth degree, the succession devolves on the husband or wife surviving, and in default of a survivor, it devolves on the State.

Natural children who have been recognized are not considered as heirs, but have a right to a portion of the succession (Articles 756 and 759).

They take even in preference to the survivor of husband or wife and to the State (Article 758).

The principles of the division of property as settled by law are as follows:—

Equality amongst all legal heirs called to take part in the succession, and which they have accepted (heirs to a property must accept all debts thereon, and thus have the right to refuse to accept the property, except "sous bénéfice d'inventure," which means, they are only responsible to pay the debts to the extent of the property allowing them to do so).

The principle of equality is carried to such an extent that an heir must restore to the estate anything he may have received by deed of gift either directly or indirectly. He cannot even claim a legacy made by the deceased unless the gift or legacy has been expressly made to the heir "par préciput et hors part et avec dispense de rapport" (Article 843), which means, as to "préciput," by preference as to "hors part," without being bound to contribute to distribution; and as to "dispense de rapport," without being bound to give up anything which he might have received before-hand.

The law presumes that, unless the deceased shall have specially declared to the

* Code Civil, book iii, caps. 1, 2.

contrary, it was his intention to maintain complete equality between all the heirs who accept the succession.

It must be borne in mind that in no case may any one of the heirs be advantaged over the others beyond the portion allotted by law.

Real and personal estate are alike divided equally. When real property cannot conveniently be divided, it is sold and the proceeds divided amongst the heirs; but a sale must only be resorted to if division of a property is almost impossible ("lorsque le partage en nature n'est pas commode"); Article 827, Code Civil.

The object of this is to prevent the accumulation of landed property. This system was introduced into Belgium at the time of the French Revolution. Although the law tends to diminish the number of large farms, there are, nevertheless, as shown by the statistics already given, still a certain number, owing either to some wealthy person having succeeded in keeping their properties together, or by their buying many properties, or owing to farmers leasing lands from different owners and uniting them into large farms. In some localities it is the interest of the owners to let his land to a farmer who already cultivates land belonging to other owners; while in other localities it is his interest to lease it to a small farmer. With regard to the division of landed property it must be borne in mind that the partition of the land itself is not obligatory, provided those interested can come to an arrangement to make up the various equal shares from other property. In fact the law prefers that subdivision of land should be avoided if possible (Article 832, Code Civil). For instance, the Court decided in a case which came before it, that a farm situated in the Campine could not be divided on account of the nature of the soil not admitting of its being cultivated in small patches.

Had this same property been situated in the neighbourhood of Brussels it would have been divided. A family may agree not to divide a property, but no agreement of such a nature may be entered into for a term exceeding five years; but, all parties concerned being willing, the agreement may be renewed at its expiration for another five years.

The sale of land, its transfer, exchange, or division, is effected between parties by a deed before a notary, or the decree of a Court of Justice.

The total cost of registering a deed of sale or cession amounts to about 5 francs 20 centimes per 100 francs on the sum mentioned as the price.

The non-registration of the deed within the time prescribed by law entails a fine which consists in the duty or tax being doubled.

The main legal object of the registration is to authenticate the date of the deed; but a material object is the levying of the tax. The cost of registration of a deed of exchange amounts in all to 78 centimes per 100 francs. The tax is only levied on one of the parties. Tax on division of property between co-proprietors amounts to about 6 francs 61 centimes per 100 francs. A complete code of laws exists on registration.

The best work on the subject is said to be by M. Bestiné, and this work is considered an authority.

When a deed of sale or transfer is registered, it is transcribed *in extenso* in a register kept in an office *ad hoc*. This register is open to public inspection. The cost of this transcription, the object of which is chiefly for the prevention of fraud in sales, amounts from 1 franc to $1\frac{1}{4}$ francs per 100 francs. The same system of registration extends to mortgages.

Mortgages on land are much sought for, the rate of interest, except on large amounts, being about 5 per cent.

A mortgage is generally executed before a notary; registration, which is effected in the same way as the registration for the transfer of property, is prescribed chiefly with a view to the tax leviable.

This tax amounts to 1 franc per 100 francs, with 30 centimes of additional dues.

The law on mortgage is contained at the end of the Code Civil, and bears date 16th December, 1851.

No especial facilities are afforded in Belgium for borrowing money on lands, either from Government, special public Companies, or banks. Land in Belgium is, as a rule, little burdened, but it is not uncommon for small cultivators to borrow money of local usurers or of notaries, their lands or stock forming the security. Many thus get into difficulties from which they are unable to extricate themselves.

Regulations for leases are contained in the Code Civil from Articles 1714 to 1751, and from 1763 to 1778.

A lease gives a tenant no right to the realty ("aucun droit réel"); leases when granted generally run for nine years, sometimes for twelve, fifteen, and even eighteen years.

When a holding is but of small exteut, and there are no buildings upon it, it is often

let without written agreement and for no specified term, and sometimes it is let with an agreement for three, six, and nine years. The right of such letting, or of making over the lease to another, depends upon the terms of the agreement. In default of an agreement silent upon this point the tenant may sub-let or make over his land to another (Article 1717 of the Code Civil), unless, indeed, the rent is to be paid by sharing the produce of the land.

This latter system of payment is, however, rare. I have been told that it exists near Hasselt.

No law obliges the lessor to consent to the sub-letting or cession of his property, unless it had been stipulated to the contrary in the lease. Leases may be registered, but as this entails a fee it is seldom done. The result of registration is to give an authentic date to the lease. If a lessor sells his land, the purchaser cannot evict the tenant who has such an authentic lease, or of which the date is certain, unless the right has been reserved in the agreement (Article 1743, Code Civil). Moreover, if the lease exceeds nine years, the formality of transcribing it must be gone through. In default of transcription, the duration of the lease is reduced in conformity with Article 1429 of the Code Civil to a term of nine years.

Land let without a written agreement is understood to be let for the term necessary for the tenant to gather in his crops: thus a meadow, a vineyard, the produce or fruits of which are gathered, in the term of a year, is understood to be let for a year. Arable lands are generally understood to be let according to the course in which they are cultivated. The terms of Article 1774 of the Code Civil on this subject are "par sales ou saisons" according to the rotation of crops. It is customary to manure the lands in such a manner as to obtain several crops in succession, as for example, potatoes, wheat, and oats, and the Tribunals decide that when land is cultivated in this manner a parol agreement must hold good for the term necessary for the farmer to obtain from his land the profit from the manure which he has put into it.

There is no law or custom whereunder a tenant is considered as having a right to remain in occupation of his holding even as long as he punctually pays his stipulated rent; as soon as the lease is expired, nothing can oblige the proprietor to continue the tenant. The lease having expired, the lessor can force the farmer to quit the farmer. If the tenant has expended money on matter which are quite indispensable, such as mending the roof of a barn, he can claim reimbursement of his expenses; if on matters which are not indispensable, but only useful, or done for pleasure, without the landlord's consent (buildings, draining, manure), which remain in whole or in part attached to the soil. The respective rights of the parties are regulated by their agreement. In the absence of an agreement the owner is not bound to pay any indemnity; but the tenant has the right if he can to carry away with him all the improvements he has made, on the condition of restoring the land to the owner in the same state in which he received it; if the improvements are attached to the soil ("au fonds") the owner may prevent them being taken away on paying for them to the tenant. The tenant has no right, however, to remain on the farm after the expiration of the lease pending payment by the landlord for his improvement, and for the amount, of which he is only a "simple contract" creditor, having his recourse before the ordinary Tribunals of the country.

With regard to manners and customs applicable to out-going an in-coming tenants, I have annexed a translation of these customs extracted from the official Report on agriculture published in 1862.

Rent is agreed upon between the proprietor and tenant.

At the expiration of a lease the proprietor treats with whom he pleases, the tenant likewise.

Farms are generally let by private contract, certain public establishments, however, hospitals (hospices), for instance, possessing lands, let them by public competition, and a lease is granted to the highest bidder provided he furnishes the necessary guarantees as to solvency, &c.

Rent is not regulated either by custom or valuation,—rents are generally paid annually at the expiration of the year, which was, according to old leases, generally considered to expire on the 30th November, latterly, however, leases are considered to commence and finish after the gathering in of the first crop about the 15th September. According to law, in the event of a dispute arising between landlord and tenant as to the amount of rent to be paid after the tenant has entered upon a farm on parol agreement, the proprietor is believed upon his oath, and if the tenant wishes he can call in valuers to value the rent, in which case the tenant, if the valuation exceeds the amount he has declared, must pay the expense of the valuation. This is the only case in which the amount of rent is decided by valuation.

A landlord, in endeavouring to let his farm, is at liberty to ask any rent he pleases; he can evict a tenant in case of non-payment of rent, or for any breach or infraction of covenant. According to the terms of Article 20 of the law of 16th December, 1851, in the event of non-payment of rent where there is a valid lease duty registered, the landlord has a prior claim over all other creditors. He may seize all live and dead stock, even though removed from the farm, and maintain a privilege over them for a space of forty days.

The landlord, in order to exercise his privilege, has recourse to the procedure known as "saisie gagerie," which is regulated by Article 819, and the following Articles of the Code Civil. This procedure is most expeditious.

If the rent is in arrear even for an hour the proprietor can serve a notice upon his tenant through the "huissier" (an officer recognized by the Court for this purpose); twenty-four hours after the serving of this notice he may seize all the effects and crops in the building and on the land. If the rent for the whole duration of the lease does not exceed 200 francs (8*l.*), the tenant is summoned before the "Juge de Paix;" if, on the other hand, it exceeds that sum, he must appear before the "Président du Tribunal."—(Law of 5th October, 1833, and of 25th March, 1841.)

The person summoned must usually appear before the Court one day after having received the notice.

In the event of a demand for eviction for non-payment of rent being made the authorities above-mentioned often endeavour to obtain a short delay for the tenant, and if the tenant appears in Court with the sum necessary to cover the amount of the rent due, permission to evict is never accorded. Eviction having been pronounced, the former must leave generally within 8 or 15 days. Demands for eviction are, as a rule, rare. The tenant knowing that he must quit at the expiration of his lease, does not expose himself to legal expenses, and rents, as a rule, are regularly paid. Landlords are, moreover, not very exacting as to their payment precisely on the day appointed.

In order to obtain, through conversation with persons in different parts of the country, some insight as to the state of the agricultural population,—the relations between landlord and tenant, I visited various parts of Belgium, and have endeavoured in the following notes to give some information which I trust may prove of interest.

Campine.

To the north of the fertile plains of central Belgium lies a vast tract of land comprising nearly the whole of the Provinces of Antwerp and Limburg. This region is called the Campine; an immense tract of heath and bog, with here and there, except where man has conquered and improved the soil, a few stunted trees. The soil of the Campine is chiefly sandy, and represents now much what the two provinces of Flanders were before they were brought into cultivation.

Up to the eleventh and twelfth centuries this country had been but very thinly populated, but at that epoch large abbeys were established there and the monks by degrees brought a considerable portion of this desert region into cultivation. They built farms and let them to the tenants, at first receiving their rents in kind, later in money. In the time of Maria Theresa much attention was given to the waste lands in Belgium, especially in the Ardennes and in the Campine. Progress has continued, and now, owing to the exertions of the Government, who have constructed a canal connecting the Meuse with the Scheldt, and running through the heart of this district; many parts have been converted into well-irrigated meadows, portions have been made to produce cereals and root crops, whilst soil which is too poor for such productions is being gradually planted with Scotch fir. In the year 1846 there were 290,003 hectares of heath and waste land in Belgium, 162,896 hectares of which belongs to communes.

With a view of bringing the waste land appertaining to these communes into cultivation a law was passed on the 25th of March, 1847, conferring on the Government the power to order the sale of uncultivated communal lands, whenever such measure should be considered likely to prove beneficial to the public.

This law met with considerable opposition in the Ardennes, but is now favourably looked upon both there and in the Campine, the result having been to increase agricultural products, to ameliorate the condition of the people as well as that of many of the communes who, till then, had been without resources.

Between January 1847 and December 1860, 64,044 hectares of uncultivated communal lands in Belgium had been broken up and converted into arable or pasture land, planted on or sold, leased, or allotted to inhabitants of the communes; and counting the waste

lands which have been brought within the same period into cultivation by private owners, the total may be estimated at 70,000 hectares. The land tax ("impôt foncier") on waste land scarcely amounts to 20 centimes per hectare, and this cannot be increased until twenty years after land has been broken up, and made productive.

The holding of small proprietors in the Campine (and there are few large proprietors) average from six to seven hectares of land. The houses and farm buildings are usually built of brick and tiled, with a coat of thatch over the tiles on the upper part of the roof as an additional protection against the weather.

A proprietor of six or seven hectares generally has one horse or two oxen to work the farm. The land is usually cultivated by the owner and his family, farm labourers being but little employed.

These small proprietors throughout the Campine have attained their position through their own industry and frugality.

From time immemorial the inhabitants of this part of Belgium have been pedlars ("colporteurs") forming a guild, in which they have different grades; they have a private bank, a treasurer who is charged with paying the interest to the various depositors in this bank, and the purchase of the goods in which the members are to trade. These pedlars of the Campine travel to all parts of Europe, carrying their wares, even as far as Russia.

Their trade has of late, owing to increased facilities of communication, been much reduced; they still, however, continue to thrive, their chief traffic being in the purchase of human hair, which they sell to dealers in that article, and for which there is too great a demand in this civilized age.

While the husband is away the wife remains at home and takes care of the cottage, which is improved as the savings increase. Then a little more land is bought and cultivated.

When the father of the family finds sufficient occupation and means of subsistence on the land, he remains entirely at home, still maintaining, as a rule, an interest in his guild.

One farmer, who owned about six hectares of land, whom I visited, had been during thirty-five years a pedlar, and those of his children who were not required to assist on the farm were either following the same trade their father had plied so successfully, or were engaged on the public works in course of execution in the neighbourhood, or in some industrial trade. The burgomasters and small landowner in the same commune had also been a pedlar. Proprietors of any considerable amount of land let it to tenants on lease, retaining in their own hands only sufficient garden land to supply their own wants.

Leases generally run for three, six, and nine years. At the end of the lease the landlord enters upon all improvements without paying compensation to the tenant.

The landlord supplies the house and buildings, and does the repairs, except what are termed tenant's repairs.

A landowner informed me that in order to avoid any misunderstanding as to repairs he stipulated in his leases that his tenants should do all repairs, except to the roof.

The condition of the small proprietor and the tenant differs but little if at all in the Campine. Both are badly fed, eating meat but three or four times a-year, their diet consisting chiefly of bread, butter, coffee (composed in greater part of chicory), and potatoes. They are exceedingly industrious, but from want of substantial nourishment are weak; although at work early and late, are unable to do a really good day's work. They are tolerably well clad, nearly all having a cloth suit for Sunday and holiday wear.

The majority of the inhabitants of the Campine, be they small proprietors or tenants, are exceedingly ignorant. Their whole time being devoted to hard and continuous labour, neither parents nor children have much time to give to education.

The land, though poor, might be made more productive were there more capital in the country, a dense population, as in Flanders, or more science brought to the system of cultivation

Moreover, the people have a great thirst for acquiring land; and a farmer, instead of laying out his small savings in improving what he has, will generally endeavour to buy more. Properties here, as a rule, lie in a ring fence; but the tenant who wishes to farm much land would have a difficulty in finding it lying together, naturally a source of much inconvenience, resulting from the smallness of the properties.

The rotation of crops in this district is as follows:—

1st, potatoes; 2nd, rye; second crop after the rye, rye grass ("spergul") or turnips. After turnips, manure and then rye or potatoes. Spergul is grown as forage for the cows, and is said to produce much milk. As it is a very exhaustive crop it is forbidden in some leases. I should mention that the above rotation is not always followed, many planting their crops entirely regardless of rule, and heedless as to the consequences to the

soil. Rye is, for instance, sometimes grown on the same land ten years consecutively. The average yield of rye per hectare is 14 hectolitres. Oats are sometimes sown, generally after grass, and average 35 hectolitres per hectare.

Turnips are not hoed or thinned, consequently do not attain any size. The land is not fitted for second crops. The cows are rarely turned out to pasture, the grass being kept entirely for hay. In the spring the young stock is turned out on the heaths, and late in the autumn the cattle are occasionally turned out for a short time; but as a rule they pass their existence in the stable. Cattle in the Campine have increased by one-third within the last seventy years. A fair calculation is one cow or ox to each hectare of cultivated or pasture land. Machinery in the Campine is almost unknown.

In the year 1851 the Belgian Government, partly with the view of bringing more of this cold and barren soil into cultivation, and partly in hopes of relieving the Flanders of some of their teeming population, established an agricultural colony on a heath bought by the State of the Commune of Lommel, situated near the canal which joins the Meuse and the Scheldt. The superficial extent of this tract of land, which was said to be of good soil, amounted to 96 hectares.

The Government brought a portion into cultivation, erected a church, a school, a presbytery, constructed roads, &c.; divided the land into twenty farms, erecting small houses and necessary farm buildings upon each. On being offered on lease each farm consisted of 1 hectare of irrigable meadow, 1 hectare of arable land partly sown with rye, and manured, and three hectares of heath land.

Leases were granted for a term of thirty years. The Government in the leases guaranteed to the tenant a supply of water for irrigation, undertaking to maintain in good order all the means of supplying the water. The tenant, on his side, was required to bring farm implements, to prove himself to be in possession of 100 francs (4*l.*) to defray the cost of establishing himself; of cattle to the value of 300 francs, or of a sum of 300 francs to be deposited in the hands of a neighbouring notary. During the first five years the tenant was to pay no rent, but was bound to trench, and to bring into cultivation the heath land. In the event of the terms of the lease not being complied with, the tenant was to quit at the end of the term, and to pay a sum of 200 francs for every year that he had been in possession. After the fifth year the tenant was to pay half-yearly a rent, as follows:—

1. Say from 1st March, 1856, to 1st March, 1861, an annual sum of 110 francs, or 22 francs per hectare.

2. From 1st March, 1861, to 1st March, 1871, an annual sum of 175 francs, or 35 francs per hectare; and for the remaining ten years of the lease an annual rent of 210 francs, or 42 francs per hectare.

The tenant was also bound, after the first five years of the lease, to have in his stables one head of cattle at least, or its equivalent, namely, 1 hectare in arable land, or if not, to prove that during a certain period he had purchased and placed upon it a stipulated quantity of ordinary manure. The tenant had also the right to the underwood planted as shelter round each farm. He was bound not to sublet his farm without the express permission of the Government. He was to keep the buildings in tenantable repair, and was entitled to no indemnity in case of throwing up his lease. Such were the general conditions of simply leasing these farms. The Government, however, granted also conditions of lease, with power of purchase after the first five years of occupation. The purchase-money amounted to the sum of 4,250 francs, to be paid in four instalments in four years, with interest of 4 per cent. per annum, or else to be paid in annual small instalments during a term of thirty years.

The above are the general features of this plan, the details of which are given in the inclosed printed document, kindly furnished to me by the Director of the Agricultural Department of the Minister of the Interior at Brussels.

With regard to the results of this scheme the Government had no difficulty in finding tenants, who came chiefly from the provinces of Flanders; but their hopes as to its success were doomed to disappointment. According to my informant, who was on the spot in charge of the works for irrigating the country, the tenants from the first considered themselves as Government pensioners; considered further, that it was to the Government rather than to their own industry that they were thenceforth to look for a living; and, moreover, they turned to other purposes the subsidies which the Government gave to enable them to buy stock.

After ten years the Government put the land and buildings, which had cost them in all a sum of about 260,000 francs, up to auction, realizing only a sum of 40,000 francs. I was fortunate enough to meet with the purchaser, who informed me that he had evicted all the idle tenants he had found upon the estate; had at once granted leases for six years to other tenants, affixing a rent of 50 francs a-year to each farm (consisting of 4 hectares

of land), with the condition that the 2 hectares of heath land should be broken up. At the end of the lease he took these 2 hectares of trenched land upon each farm into his own hands, and planted them with Scotch fir, re-leasing the other 2 hectares on lease at a rental of 60 francs per annum. It is now an improving property. He expressed to me his decided opinion that the Government should not intervene directly in agricultural matters, but should indirectly facilitate improvements by reduction of taxes and dues.

I may mention with reference to this that nearly all canals in Belgium belong to Government who allow lime and manures to pass free of dues.

Pays de Herve.

About twelve miles from Liege, towards the Prussian frontier, is situated the town of Herve, which gives to the surrounding district, rich in pastures and orchards, the name of "Pays de Herve."

The "Pays de Herve" is entirely devoted to dairy farming.

A gentleman owning a small farm not far from the town most courteously and kindly answered my many inquiries as to the management of the land in his district. He said that like himself most landowners let their properties on leases of six or nine years to tenants.

The houses and farm buildings, which are substantially built of stone and roofed with slate, are erected by the landlords who do the external, the tenant being bound to do internal repairs. Few landlords, he said, resided upon their properties. He himself had two tenants, one had held under him for upwards of forty years, the other for nearly twenty. The relations between landlord and tenant, he stated, were excellent. There were some small proprietors who farmed their own lands, and their properties averaged from 4 to 5 hectares in extent; a tenant generally endeavoured to obtain 10 or 12 hectares of land on lease.

The necessary capital to enter upon a farm of 10 hectares, he stated to be from 5,000 to 6,000 francs. It must be borne in mind that in this district entirely grass land, the farmer has to provide himself with but few agricultural implements. The average rental of land in the Herves is from 150 to 200 francs per hectare. Rent is paid as a rule in money, some few landowners residing in the vicinity receive a portion of their rent in dairy produce, but this practice is quite exceptional.

A tenant, I was informed, can claim no indemnity, on leaving his farm, for improvements he may have made during the term of his lease.

Farm servants' wages average here for men 70 centimes per day, with board and lodging, women receiving 50 centimes. Few labourers are employed excepting for the hay harvest, when they come from neighbouring provinces, returning to their own homes after the harvest.

As a rule the farm work is performed by the owner or tenant, and his family, and if the family is too numerous, some of its members seek employment elsewhere in an industrial trade, such as shoemaking, for instance, a very thriving trade in the town of Herves.

The peasantry are well fed and clothed, meat forming a large portion of their diet; a luxury almost unknown in the Campine.

The pastures are managed as follows, two-thirds of the farm kept in pasture during six years, while one-third is laid up for hay during three years, so that each field during a lease of nine years has been in pasture for six, and laid up for hay for three years.

The leases usually contain a clause forbidding the breaking up of the grass lands.

The fields are inclosed with hedges, the cuttings of which the tenant has a right to; the standard trees belonging to the landlord.

The average number of cows is three to 2 hectares. No cattle are bred for exportation, only a sufficient number being reared to keep up the stock necessary for the farms. During the winter months the cows stand in stables with brick flooring. No straw being produced in the district they have no bedding, and no manure is consequently formed. The dung is, however, carefully preserved, and even the manure dropped by the cow in the fields is distributed over the grass so as to insure all parts being equally fertilized.

Cheeses known as Limbour cheeses are made in this district, and bought up by merchants who come round to the farms.

In the autumn and winter the population are much engaged in making syrup from the fruits produced in their orchards. I was assured that during the last twenty years the price of dairy produce had doubled, and that consequently rents had doubled likewise.

Bordering upon France, and adjoining the provinces of West and East Flanders, Brabant, and Namur, lies the province of Hainault, in which are some of the largest mines

and industrial towns of Belgium. I visited a farm near La Louvière, a small town of very recent existence, and which is rapidly assuming large dimensions. The farm in question belongs to a gentleman who resides in France, where he farms land himself on scientific principles, often visiting England in company with his tenant who farms his land near La Louvière, in order to study any new invention bearing upon agriculture, and which might prove useful to adopt either on his farm in France or in Belgium.

The farm near La Louvière consists of 92 hectares of land, the annual letting value of which average 135 francs per hectare, the tenant having a nine years' lease. He informed me that the minimum capital to enable a tenant to take a farm of this size (lying in a ring fence) was from 40,000 to 50,000 francs. He had fifteen horses, twenty-six cows (mostly Dutch breed crossed with Durham) one Durham bull, Derbyshire pigs, no sheep. The buildings are built and kept up by the landlord. The yard was roofed in. There was a steam-engine on the farm, and, in fact, almost every appliance which is to be found on a model farm in England or Scotland.

The rotation of crops on this farm is as follows:—1, grass; 2, barley; 3, wheat; 4, beetroot. The crops grown in the neighbourhood are wheat, rye, barley, clover, oats, flax, potatoes, colza, and beetroot, the latter chiefly for the manufacture of sugar. The wages of farm servants average 30 francs to 40 francs per month for men, with board and lodging; women receiving 1 franc per day. The lodging provided for the herdsman was certainly not enviable; his bed consisted of a box affixed to the roof of the cow's stable, to which he ascended at night by means of a ladder. This, I understand, is a very general way of lodging male farm servants throughout the country.

This farm being in the neighbourhood of large iron works, farm labourers wages are high.

Besides this farm there were several large farms in the neighbourhood "grande culture," apparently preponderating over "petite culture" in this vicinity.

From La Louvière I returned to Mons, and drove thence through an uninclosed plain towards Badoux; the country through which I passed was evidently almost entirely farmed by small owners or small tenants. The people were squalid, a poorly-fed looking race, and certainly the lot of the farm servants I had lately seen appeared more enviable than that of some small owner or tenant, who, with his wife harnessed to the harrow, was endeavouring to eke out a subsistence off his little patch of land. I entered, after passing Badoux and Belveil, the commune of Blicquy. In this commune there are two farms of about 100 hectares each, the remainder of the land in the parish being farmed by small owners or by small tenants.

I had some conversation here with a gentleman farming about 100 hectares of his own land. He expressed to me an opinion that the small owner is in very many instances less intelligent and less hardworking, than, and in an inferior condition to, the small tenant. The passion for buying land, he said, was so great in Belgium, that ruinous prices were paid for it, which left to the purchaser little or no capital to lay out upon his purchase, which brought him in $1\frac{1}{2}$ per cent. or 2 per cent. at the most for his outlay.

A hectare of land sold in small allotments, he stated, would fetch in the market, so great was the competition for land, as much as 15,000 francs; whereas a piece of land, 10 hectares in extent, sold in one lot, would not fetch more than 10,000 francs. Mortgages on small properties he said were rare, although sometimes a purchaser would pay for two-thirds of his purchase in ready money, and mortgage the rest for a short term. Land at a distance from villages and towns was not, he stated, so much divided, properties were much scattered, and tenants had great difficulty in hiring land lying together, a source of very great inconvenience.

I remarked upon the way upon which I had seen the land farmed in some parts of Belgium, where the soil was light, asking whether the second crop of turnips, which is very general, and sown immediately after the rye is off the land, was good, he said that it was most exhausting to the soil, and producing little or no result; that where the small proprietor or small tenant had no good example he farmed very badly; that a large farm well farmed would produce twice and thrice as much in the course of the year to the hectare as a small holding. (This, I think, should only be considered as referring to this district.)

Small holdings, however, produced higher rents; it was consequently in the interest of landowners to let their properties in very small farms, say of 1 hectare each, rather than in farms of 50 or 100 hectares. He further remarked that Belgium was formerly cited as an example for agriculture, but that to-day she was retrograding. Oxen and cows are more used than horses by small farmers for agricultural purposes in the vicinity of Blicquy, a good many cattle being also reared there. No butter is made, the milk going to fatten calves.

With regard to machinery, I understood that most farmers who had 20 hectares used threshing machines.

The rotation of crops upon the farm I visited at Blicquy was stated as follows:—1, rye and clover; 2, beetroot; 3, wheat.

Flax was grown every ten years (in some farms it is grown every six or seven). The system adopted upon this farm with regard to flax was to clean the land well after wheat, and to sow (*Treple incarnat*) trefoil, which, when it had attained a certain height, was ploughed into the land as manure and then flax was sown.

Flax, in many parts of Belgium, is sold standing to the merchant, who cuts the crop and carts it off the land.

The chief crop in this district, and in a great part of Belgium, is beetroot, which is largely grown for the manufacture of sugar, and in some places a coarse spirit is distilled from it, which I was informed was much used for the manufacture of wines sold as sherries, madeiras, &c. The pulp is preserved in dry tanks or buried in pits, and covered with the earth (which latter system is found to answer the best) and given to cattle to fatten them during the winter.

On a space of three square leagues in the vicinity of Lenze and Blicquy there are as many as eighteen sugar refineries. Beetroot is averaging this year near Lenze 20, 22, and 26 francs per 1,000 kilos. It is said to be a very exhaustive crop. The same system I found prevailing here as elsewhere with regard to buildings, viz., the landlord erecting them, the tenant being bound to hand them over at the end of his lease in tenantable repair.

Evictions of tenants are rare unless rent is not paid, and if rent is not paid, the tenant can be evicted before the termination of his lease. With regard to improvements I was informed that in that part of the country the tenant could not claim indemnity for improvements he might think fit to make, and a tenant who farmed 70 hectares of land, eight of which he had drained at his own expense, stated to me that he did not expect any indemnity from his landlord for the improvement.

Drainage, however, as a rule, he said was done under arrangements similar to those often made between landlord and tenant in England. In this district, owing to its proximity to France, where wages are higher, there is some difficulty in obtaining labourers. Many go to France for harvest work, returning in the winter to their communes in Belgium, where they employ themselves in cleaning flax.

Some families have emigrated and established themselves in France. But emigration from Belgium on the part of its inhabitants is, as I have already shown, as a rule exceptional.

I had already heard that not far from Lenze, in the country round Tournai, Ath, and Courtrai, an ill-feeling, termed in Belgium "mauvais gré," had for long existed between landlord and tenant. I accordingly made inquiries respecting this report. I received the following account:—This "mauvais gré," it was supposed, had originated by the landlords exacting a sum of money from incoming tenants previous to allowing them to take possession of their respective farms, and at the termination of the lease refusing to repay the sum exacted. The evicted tenant, feeling himself aggrieved, caused outrages to be perpetrated, in general not upon the landlord but upon his successor in the farm, unless the successor made good to him the money he had paid to the landlord upon entering the farm. Crimes and outrages of a very serious nature were committed, assassinations, rick burning, destruction of stock, crops,—and the actual perpetrator being, as a rule, hired from a distance. The evicted tenant taking care to be seen as much as possible in public in order to be able to prove an alibi in the event of suspicion falling upon him. The inhabitants of the commune where an outrage was committed always pleaded ignorance as to its having taken place. I should have mentioned that if a landlord wished to take his land into his own hands at the termination of the lease no ill-feeling was excited.

Anxious to obtain further information upon this matter, I proceeded to Tournai, and there placed myself in communication with the Procureur du Roi, who very kindly placed judicial papers at my disposal, from which I have extracted the following with regard to this matter:—

The "mauvais gré," as it is called in the country, according to a judicial publication dated 9th July, 1846, "La Belgique Judiciaire," consists in an outgoing tenant doing his utmost to prevent the proprietor from leasing his property to another tenant unless the incoming tenant or proprietor purchased his (the outgoing tenant's) consent to the arrangement. Should the incoming tenant or proprietor attempt to defy this barbarous custom ("usage barbare"), outrages on property and assassination follow, and justice rarely finds witnesses to testify to the outrages, even though committed in broad daylight under the eyes of the population of the commune.

This "mauvais gré" is supposed to have originated in French Flanders, to have thence

spread to the district of Tournai, St. Amand, and Martagne, invading next certain parts of the provinces of Hainault and Brabant, and reaching even as far as Brussels.

In 1843 it was found to prevail in the whole arrondissement (district) of Tournai, and in some communes in the districts of Ath and Loiguies, but was unknown near Mons, Thuin, or Charleroi.

The first known instance of special legislation to repress this ill-feeling "mauvais gré" is contained in a proclamation or placard issued by Charles V on the 28th July, 1585, at Lille, Douay, and Arches.

This placard, it appears, produced good results, as twenty years later the authorities of Tournai prayed for its extension to the towns and bailiwick of Tournai, Toumaises, Mortagne, and St. Amand. The repressive measures set forth in this proclamation are not stated. In 1619 the Arch-Dukes Albert and Isabelle issued an order to prevent these agrarian outrages, attaching the following punishments :—

Threats not followed by action to be punished by flogging and banishment from the Netherlands. Attempts at carrying threats into execution, and acts of violence, to be punished with death. Coalitions formed with a view of preventing farmers taking farms to be punished with flogging and banishment.

This proclamation was posted in the different villages where the "mauvais gré" existed.

These severe measures were not, however, sufficient to crush these outrages. For in 1752 the Empress Maria Theresa ordered that all landlords who could not find tenants to retake their lands at their real value might put them up to public competition one year before the expiration of the lease. If no tenant came forward the communes were bound to find a tenant, and to guarantee his obligations towards the proprietor, until a farmer willing to take the land could be found. The outgoing tenant was declared, civilly, responsible for incendiarisms, murders, injuries, or outrages which might happen to the proprietor, the incoming tenant, or to their respective families. If a crime was committed and the guilty were not immediately found, the last tenant was arrested and imprisoned, together with his family, his goods were seized and sold, and the proceeds, debts being deducted, went to indemnify the injured parties, unless the persons under arrest could prove within three months that the outrages had neither been committed by themselves, their adherents, nor with their knowledge or sanction.

The inhabitants of communes where cases of "mauvais gré" occurred, and who failed to denounce them to the authorities, were collectively and individually bound to make reparation for injuries suffered.

In 1778 a degree slightly modifying the penalties set forth in the special Edict of 1752 was issued.

Threats were to be punished with flogging and banishment for ten years. The putting threats into execution with branding and perpetual banishment. A reward of 200 florins was offered to any one denouncing the offenders with free pardon if he was an accomplice, and the promise of his name being kept secret.

The fact of a general order being issued, showed that these agrarian outrages were spreading. The French Government also wrestled with the evil, and the Prefect of Jemappes adopted very rigorous measures, especially in Hainault; troops were quartered upon the communes, but these measures do not appear to have had any very efficacious result.

In a despatch dated 29th October, 1842, addressed by the Governor of Hainault to the Minister of the Interior, the following passage occurs :—

"If the proprietor, making use of his undoubted rights, despises this usage worthy of another century, no one, either in the commune or in the province, would dare to hire or buy the farm, no matter what price were put upon it. Should anyone venture to do so the outgoing tenant would immediately burn the barns and mills and would commit in broad daylight the most violent outrages."

In France the Conseil-Général du Departement du Nord expressed the desire that a Report should be drawn up as to the condition of tenants or farmers where the "mauvais gré" extended its ravages, also as to the amount of land they held, so as to render farmers or tenants responsible in proportion to the extent of their holding for injuries, crimes, or outrages which might be committed against the person or property of an incoming tenant. An outgoing tenant was to be considered for six years after leaving his farm, as responsible for any outrage committed upon his successor, unless, indeed, his domicile was fixed at a certain distance from the seat of the crime.

These measures in some way resembles the system adopted under Maria Theresa. In 1845 the Belgian Government, although petitioned by the Governor of Hainault to legislate especially for the repression of agrarian outrages in his Province, considered that the existing laws, if rigorously applied, were sufficient.

They increased the gendarmeries, placed troops at the disposal of the authorities, and stimulated the zeal of officials and the severity of tribunals.

These measures appear to have had the desired effect, for since the year 1846 but little mention has been made of "mauvais gré."

The following cases will exemplify the nature of the outrages and their causes :—"In January 1844, a farmer at Eplechein, a village near Tournai, complained that he was the victim of 'mauvais gré' because he had taken a farm for which another tenant had refused to pay a slight increase of rent. He stated that he was forced to be armed night and day, that his daughters were mobbed, that sheep and cattle were turned out upon his fields, and that his son had been driven from his work."

In the same month the stableman at the Haras de Frasnes, belonging to the Marquis d'Ancy, was fired at. The Marquis, in order to escape from the demands of his tenants, was obliged to take his lands into his own hands. In the same month a farmer at Grand Camp was shot dead in his own house.

In consequence of these repeated outrages rigorous measures were adopted, and the following Circular was issued by the Governor of Hainault in February 1844 :—

"The arrondissement of Tournai has been for some time the theatre of outrages occasioned by what is termed 'mauvais gré.' These outrages have become so frequent, and so serious, that the Minister of Justice has thought it necessary to propose the adoption of prompt and energetic measures for their repression.

"The Minister of War is about, therefore, to submit to the approval of the King the draft of a Decree augmenting by four mounted gendarmes the Brigade of Tournai, and ordering the establishment of a Foot Brigade consisting of one brigadier and four gendarmes in the commune of Cellis. Provisionally, and until barrack accommodation shall have been found for this new brigade, the men composing it are to be billeted on the inhabitants paying per day per man an indemnity of 21 centimes.

"The Minister of War has also given orders authorizing the Commandant of Tournai to place at the disposal of the gendarmerie, and upon the first requisition that shall be made to him by the Lieutenant of Gendarmerie commanding the arrondissement, a detachment of 2nd Regiment of Foot Chasseurs. The strength thereof to be regulated according to circumstances, to proceed to the communes where their presence might be required in order to assist the gendarmerie.

"During the period that the troops may remain in the commune they are to be lodged and fed at the expense of the inhabitants.

"Although the preceding measures apply more especially to the communes of the Cantons of Antoing and of Celles, the authorities of other localities are recommended to bring them to the notice of the inhabitants, and to call their attention to the measures which will be adopted with regard to themselves at the very first manifestation of an act of 'mauvais gré,'"

In the spring of the same year, at the Assizes of Hainault, a man named Hovinne, residing at Vault, feeling himself aggrieved that a farm, which had formerly belonged to his brother, and which at his death was sold, had not been leased by the purchasers to his children as he wished, was condemned to death, for having, on the 31st of August, 1843, endeavoured to blow up a mill on the farm.

Two brothers, at the same assizes, were likewise condemned to death for having burnt mills containing colza, and for poisoning cattle—one of the brothers was executed in the commune of Celles, where the outrage was committed.

Desirous of learning from a high reliable authority to what cause the Belgian Government attributed the cessation of agrarian outrages, I called upon the Procureur-Général.

He confirmed what I had already heard with regard to this subject, and especially as to the custom of an incoming tenant paying to the landlord a certain sum of money, termed "un chapeau," previous to entering upon the farm, but this sum of money I understood was taken into consideration as a premium in determining the annual amount of rent to be paid.

He attributed the cessation of these outrages entirely and solely to the energetic and severe measures adopted by the Government in punishing offenders guilty of agrarian outrages. He did not consider that either religious or educational influences had in any way contributed to their cessation.

Before leaving, he was good enough to present me with copies of addresses which he had made, one in October 1862, the other in October 1863, on the meeting of the Court of Appeal at Brussels.

These addresses referred to the question of capital punishment, and set forth how that punishment had succeeded in extirpating the "mauvais gré."

In the first address, he states :—

"This 'mauvais gré' had taken deep root in that locality. It had, in truth, become endemic to such an extent, that tenants holding lands relying, if need be, upon assassination and incendiarism, did not hesitate to dispose of the enjoyment of those lands amongst their children, either by marriage contract, by testamentary, or other arrangements."

He quotes a speech made by the member for Tournai, made in the Chamber of Representatives on the 22nd December, 1843, as follows:—

"The press will have already have informed you of what is termed with us agrarian hatred ('haine de cense'); it is a vengeance which a person holding lands on lease exercises or causes to be exercised at the end of his lease, either because the proprietor wishes to cultivate those lands himself or because he wishes to make them over to another person; and the holder of a lease in communes where the 'mauvais gré' exists considers himself so completely as having a permanent holding that he often makes arrangements for dividing it amongst his children, either by marriage contract, by donations to persons living, or by testamentary dispositions. Sometimes he will make it over to another person for a sum of money down, notwithstanding stipulations to the contrary in the lease. And, if at any time the proprietor wishes to dispose of his property, he is subjected to outrage of the most violent nature. Under French rule, this ill-will was manifested chiefly by threats and by 'cutting and maiming,' and especially in the destruction of agricultural implements; but now this feeling has made such progress that it has gone so far as the poisoning of cattle, incendiarism, and assassination."

The Procureur-Général, in referring to the measures adopted by Maria Theresa, states that they were of no avail, owing to the inertness of local officials.

To escape from these outrages, he says, the proprietor who wished to take his lands into his own hands at the end of a lease, or a new tenant who wished to enter upon a farm, often came to an understanding with the outgoing tenant, and, by paying him a sum of money, bought his consent to the transaction. There were even many right-minded men who considered this indemnity a just compensation for the ameliorations acquired by the proprietor—these men were far from sanctioning assassination or incendiarism, but they nevertheless gave this "mauvais gré" a moral support, which doubled its force.

The last execution took place on the 19th February, 1850, for an attempt at assassination, committed by an assassin hired to do the deed for a sum of 90 francs.

Since that date, agrarian outrages have been almost unknown, and the people feeling that any such acts, no matter to what cause they may be attributed, will be punished by the Government (ever jealous of the rights of property) with severity, will hesitate before again having recourse to such barbarous means of obtaining what they may consider as their rights.

From the commencement of the year 1836 to the end of 1842, there had been forty-three acts of incendiarism and eleven assassinations; seven agrarian outrages entailing capital punishment had been committed between the month of July 1843 and the month of February 1844.

Although the rights of property are in some parts of Belgium (Pays de Waes, and in the immediate vicinity of Brussels, for instance) exercised with little if any consideration for the tenant, the Government have hitherto abstained, and I have been assured by a person in Government employ and holding a high office in the Ministry of the Interior, that the Government always would abstain from legislating upon the relations of landlords with their tenants, as to the granting of leases, raising rents, &c., considering that such action would be interfering with the individual rights of property.

I have annexed to this Report a translation of the customs between incoming and outgoing tenants most in use in the respective provinces of Belgium, extracted from the official Agricultural Report of 1856.

This official Report, in remarking upon these customs, concludes as follows:—

"From the foregoing it results that the relation between the outgoing tenants and their successors are often complicated and difficult, as no law regulates this matter, there being only local usages and customs often ancient to serve as guides. In many cases agricultural progress suffers from this state of things, but it is doubtful whether a general and efficacious remedy can be applied without affecting rights of property; this at least was the opinion of the Superior Council of Agriculture, which, on being consulted on this head, confined itself to recommending instruction and persuasion to enlighten the population in the exercise of their rights with regard to the management of their property."

At Dinant, and in its neighbourhood, in the province of Namur, which I visited, I heard nothing of the "mauvais gré," which seems to have been confined to the limits already mentioned.

The feeling between landlords, many of whom owned considerable property, on which they reside a portion of the year, and tenants, I was assured, excellent, evictions being rare.

Farms are comparatively large here, containing sometimes 100, 125, and 200 hectares; the necessary capital to enter upon a farm of 125 hectares, is estimated at 50,000 francs.

Written leases are granted for six, nine, and twelve years. The subletting of farms is not allowed.

Farms, however, though large, do not as a rule lie in a ring fence, properties being intersected.

The buildings, which are good and substantial, are mostly erected by the landlord, who does the principal external repairs.

I met with a servant-farmer at Dinant farming 55 hectares of land, who, on taking the farm,—his landlord not having the necessary means at his command,—erected buildings at his own expense, of which the landlord gave the plan; a written engagement being entered into, that at the termination of the lease, the whole sum expended by the tenant be reimbursed by the landlord. I was assured, that if the tenant executed improvements without the consent of the proprietor, it was not the custom in this part of Belgium for the latter to grant any indemnity at the termination of the lease.

Farm labourers earn, near Dinant, 25 to 30 francs per month, with food; and women 15 francs per month, with food; but it is not customary for the farmer to lodge his labourers, who hire cottages, which vary in rent according to their size, and the extent of land attached to them, from 50 to 100 francs, and 120 francs per annum. Most of these labourers keep a pig. The appearance of the peasants was much better here than that of those I had seen between Mons and Badon; and the land also appeared better cultivated. In this part of Belgium, and in the province of Luxemburg in particular, the communes in very many cases own lands, which the peasants may use, paying a nominal rent to the parish. In some communes peasants may have as much as 2 hectares, the amount varying according to the extent of land owned by the communes. They are not allowed, however, to erect buildings upon the communal lands; and near Dinant, peasants and farmers who are well off, are not entitled to the above privilege; but in some parts of the Ardennes every person in the commune has a right to cultivate a bit of communal land, leasing it for a term of thirty years. In some communes there is much wood, a certain quantity of which the peasantry have a right to cut every year, drawing lots as to their respective portions.

The commune of Etale, I understood, had 1,600 hectares of underwood and stunted trees; and any person wishing to erect a house in the parish, may have as much wood, free of charge, as may be necessary for his purposes of building.

I inquired at Dinant what was the condition of the small proprietor; in the first place, his position was not nearly so good as that of the large tenants who, in the neighbourhood, will bear comparison with tenant-farmers in England; and the answer I received as to the position of a man owning 10 hectares of land, was, "C'est un malheureux."

In some parts of Belgium, a man owning 10 or 11 hectares of land, can gain a living; but the nature of the soil, the facilities of procuring manure, the proximity of markets, and various other matters, must be taken into consideration; and in the neighbourhood of Dinant, excepting near the banks of the Meuse, the soil is of a cold, rocky nature, so that the existence of a man who depends entirely upon his land, may very probably fully justify the above-cited opinion.

Near Waslin, on the River Lye, I found a man owning a small mud cottage and 2 hectares of land. He had commenced life as a boatman on the Meuse, in which employment he had saved some money, and had then set up as a baker, in which trade he had also been successful. I mention this case as an example of what I have been assured to be the rule throughout Belgium, viz., that the small proprietor does not look solely to agriculture for a livelihood, but that he has auxiliary means either in the shape of money, or in some industrial pursuit.

From Dinant I went to Namur, and thence to the village of Aye in the Ardennes. The inhabitants of this part of the country congregate in villages, which are, as a rule, judging from the descriptions I have read, and certainly the village of Aye formed no exception, poor and uncleanly in the extreme. The cottages, or small farms, are built partly of mud, partly of brick, and of untarred wood, with thatched roofs. The manure from the stables in which the stock is kept during winter, is thrown on either side of the road, in front of the dwelling-houses; and no care is taken to prevent its being washed away by rain.

The opinion expressed to me here as to the general circumstances of the small proprietor, was the same as I have heard at Dinant, "Eh bien! ils vivent, ils mangent du

pain," was the description given by one person with whom I conversed. The soil, which is poor and light here, admits of oxen being used for ploughing.

I was much gratified by hearing from several persons in what high estimation an English Protestant landlord, who had for many years owned and farmed land in the vicinity, and who had by his example done much to improve the system of agriculture, and to ameliorate the breed of cattle had been held.

Much poverty exists, and last year the funds of the "Société de Bienfaisance" at Aye amounted only to 60 francs, which the managers thought it best not to distribute, so numerous were the applicants, and so small the relief they had in their power to afford.

With a view of obtaining information, more especially as to the condition of the small farmer and as to his system of cultivating his land, I visited the Pays de Waes, the portion of Belgium of all others devoted to the "petite culture."

The Pays de Waes is situated in the Province of East Flanders, between the left bank of the Scheldt and the river Durme, its principal towns are St. Nicholas, Jamise, Lokeren, St. Gilles Waes, and Beveren included in or rather forming the arrondissement of St. Nicholas. This arrondissement comprises 38,245 hectares (less woods) of which (according to the official report of 1856 published in 1862,) only 6,556 hectares were cultivated by owners, while 31,689 hectares were cultivated by tenants. (This does not include the polder lands.) The "peasant proprietor" generally speaking, according to my informant, is unknown in the Pays de Waes. The farmers as a rule only own their cottages and buildings, a small plot of land usually planted as an orchard and averaging in extent from 10 to 25 ares.*

The cottages are built of brick and tiled, and are clean and comfortable, and unlike those in the Campine are detached from the stables and buildings, which are of wood and thatched. The value of each of these small holdings is from 5,000 to 7,000 francs (200*l.* to 280*l.*)

The farmer who purchases land or buildings, is often unable to pay the whole of the purchase money at once, and has therefore recourse to a usurer, or a tradesman, or a notary, who lends him money on the security of the purchase at the rate of 4 per cent., and as many landowners in the Pays de Waes are tradesmen and notaries, it may be inferred that the farmer is not always able to fulfil his engagements.

The condition of farmers who are proprietors and that of tenants is much the same, both are forced to live with an equal regard to the most rigid economy—their diet consists of bacon, coffee, skim milk, potatoes, and black rye bread—they seldom or ever taste fresh meat.

As few of these farmers own land to cultivate they are obliged to hire it, and as properties average about 1 hectare in extent—the farmer who hires 5 hectares of land usually holds of several landlords,—properties also being excessively intersected, he has great difficulty in obtaining land lying together.

My informant stated that he considered it a misfortune for the farmer in the Pays de Waes to be the owner of his own house and buildings, for in the first place the expenses of doing all the repairs fell upon him, and in the second place from the fact of his owning a house and buildings the landowners knowing that he must have land to gain a livelihood, made what terms they pleased and granted no lease.

Whereas, in the neighbourhood of Ghent, where the small farmer neither owns buildings nor land, he obtains a lease for three, six, or nine years. Written leases do not exist in the Pays de Waes. The agreement is made verbally for a term of one year, which ceases on Christmas eve. The procedure necessary to evict a tenant from a piece of land consists in sending before sunset on the 23rd of December, a notice to quit by a huissier, and from the moment that the notice has been served the tenant may not set foot on the land, consequently, if the piece of land which he is ordered to quit contains the root crop for his cattle, and if he is unable to purchase fodder elsewhere, he is forced to sell his stock, and is in all probability a ruined man. At the same time that the tenant receives notice to quit, he is called upon by the landlord to meet him with a valuer on a certain day, and at a stated hour in order to come to an agreement with regard to the value of the manures in the ground, and of the standing crops. If a difficulty arises in estimating the value, an umpire is called in by whose decision the parties agree to abide; the tenant then pays the whole of the rent to the landlord, and settles with the incoming tenant for the value of the crops and manure, the expense of the valuations being divided between the outgoing and incoming tenant.

Evictions in the Pays de Waes are not uncommon, often in order to obtain higher rents, or owing to deaths and sales, and they not unfrequently occur from electoral

* 1 are = 100 square metres; 1 hectare = 10,000 square metres.

motives. Rents are paid annually in money, never in kind, and unless in the case of an eviction, are usually called for three months after Christmas.

Subletting (though allowed by the law of the land) is objected to by the proprietors, who give the tenants notice to quit if they do so. I heard of an instance of 10 hectares of land having been let to one tenant for the sum of 800 francs per annum, this tenant sublet the land to thirty-five other persons who paid him in all 2,000 francs per annum, the first tenant thus making a clear profit of 1,200 francs. The landlord on hearing of this in due season gave the first tenant notice to quit, retaining the other thirty-five tenants at the increased rent, viz., 2,000 francs for the 10 hectares.

The above also serves as an instance of the extent to which very small holdings in Belgium command high rents.

Landowners in the Pays de Waes mostly reside in towns, leaving their properties in many instances to the care of agents, who, again, often have sub-agents.

The small, as well as the large farmer is liable to have as landlords at one and the same time:—

A brewer, a grocer, a haberdasher, a manufacturer, a clockmaker, a public-house keeper, a farmer, a doctor, a lawyer, a parish priest (rarely owner of land), a "liberal," a "catholic.

What is the position of this tenant probably farming from 5 to 10 hectares of land? The brewer expects him to drink his beer—if he objects, he evicts him from the plot of land he holds of him, and lets it to a more profitable tenant; the grocer expects him to buy his coffee at his shop; his wife and daughters must dress well in order to please the haberdasher; he must purchase a watch and change it occasionally to please the watch-maker; he must assist his farmer landlord in getting in his crops before he attends to his own; if he or his family do not require the doctor's attendance two or three times a year, the doctor seeks for a less healthy tenant. The following is an example of the extent to which this tyranny is carried, and how indirectly profitable small bits of land can become to the owner:—

A doctor, whose wife was a dressmaker, owned 40 acres of land, which he let on a verbal agreement to a man who had a large family, seven of whom were girls, the rent of the land amounted to 40 francs per annum, but the sale of medicines and of dresses to his tenant raised the doctor's income to 400 francs a year.

Throughout the Pays de Waes (and throughout the Provinces of Flanders, except on the polder lands), spade husbandry almost entirely prevails. This system of cultivation does not admit of much machinery being used, however, threshing machines are gradually superseding the flail, and some few farmers use machinery for cutting roots. Corn is all ground in windmills, one or two of which are met with in each village. My informant states that he considered the farmer who farmed 5 hectares to be the most prosperous.

The whole of the labour on the farm is supplied by the family. The parents and two adult children can easily work a farm of 5 hectares. If the children are young a day labourer is usually employed during the harvesting, children commence work at about 6 or 7 years of age.

The farmer's wife manages the dairy and stable department. The sale of butter should, and does, indeed, pay all the household weekly expenses. Women and girls are also of great use in thinning and weeding the crops, and in the winter months they beat, clean, and prepare flax for market.

From three to four milch cows, a calf, and a pig, form the stock on a farm of this size, and there is scarcely any (if any) permanent pasture in the Pays de Waes, the cattle are all stall fed, in winter chiefly upon carrots, turnips, colza, grain and linseed cake.

One horned beast is kept on an average per hectare. With regard to cattle, I may herewith mention that large owners or large tenants throughout Belgium generally keep a bull, both for breeding on their own farms, and which they let out for a small sum to small farmers wishing to breed stock.

The Government keep a few Durham bulls at the agricultural school at Gembloux, but they are kept rather as specimens than for purposes of breeding.

The small tenant farmer in the Pays de Waes generally has ready money, with which, in the month of June, he purchases, say, from 10 to 20 hectares of flax-standing of the large farmer, paying for it usually at once or within five or six months.

The small farmer, with his wife and children, gathers in the crop of flax, washes, dries, beats, cuts, and cleanses it for sale; which, when prepared, is principally exported to England and France.

By this combination of agricultural and industrial pursuits the small farmer is able to gain a living, many if frugal and thrifty can, in the space of twenty years, amass from 20,000 to 25,000 francs. Many, however, ruin themselves by endeavouring to keep a

horse, and by hiring, probably out of a feeling of vanity, more land than they require or are able to work; many also ruin themselves by purchasing land at prices much beyond its value; the average price of land per hectare is 5,000 or 6,000 francs, sometimes it will fetch as much as 30,000 francs per hectare.

Properties in the Pays de Waes, as I have already stated, are much intersected and dispersed.

Each plot or field contains on an average half a hectare of land, which is surrounded by a ditch, the borders of which are planted at a distance of 7 inches with poplars belonging to the landlord and with underwood by the tenant, these standard trees pay the landlord about 1 per cent. per annum, the tenant may have the coppings which the landlord cuts at certain seasons, the tenant paying the expense of the cutting.

The Flemish farmer who has no horse, carts all the manure on to his land in a wheelbarrow. Liquid manure is also most carefully preserved.

The following is a detailed account kindly furnished to me by a gentleman farming land in the Pays de Waes of the system of cultivation ("petite culture") in this district of East Flanders, as it shows the expenses and profits on each crop, it is well worthy the attention of agriculturists.

Rotation of Seven Years.

First year, Potatoes.

Total profits, 1,131 francs 83 centimes, equal to 45*l.*

The average of the amount of various crops per hectare last year in the arrondissement of St. Nicholas, where the "petite culture" prevails, was, according to an official report, as follows :—

Wheat	24 hectolitres.
Rye	26 „
Buckwheat	20 „
Barley	34 „
Beans (feveroles)	18 „
Potatoes	11,000 kilometres.
Flax	555 „

Root crops were good.

I have omitted to mention that nearly all the peasants in the Flanders keep numbers of rabbits in hutches which are largely exported to England, where they are known in the markets, I believe, as "Ostend rabbits."

Large quantities of fruit, chiefly damaged, are purchased here for the English markets.

In the Pays de Waes no agricultural labourer need be in want if he chooses to work; there is even a dearth of hands. Many of the Flemish peasants go to France to help in harvesting, where they earn good wages; while many find employment during part of the year in railway and canal works.

A day labourer earns in the Pays de Waes, without food or lodging, about 1 franc 25 centimes (1*s.*) per day, and pays about 1 franc (9⅝*d.*) per week rent for a cottage.

The official Report of 1856 states that in some parts of the Kingdom the wages of an agricultural labourer attains an average of about 2 francs, without food, per day,

while in other districts the average scarcely exceeds, and is sometimes less than 1 franc per day.

Wages were in 1856 highest in the Provinces of Namur, Luxemburg, Hainault, and and Liege, lowest in the Provinces of Limburg, Antwerp, Brabant and East Flanders.

In the Flemish districts the labourer does not earn as much as in Walloon districts, where factories and mines exist in large numbers. The same difference is remarked with regard to the labourers' food.

The Flemish labourer, when fed by his employer, is content with rye bread, potatoes, and curds, with occasionally a bit of bacon or salt meat; at his own cottage his food is still worse.

The Walloon labourer, however, receives bread of mastin or spelt ("épeautre") and meat may be considered as forming a portion of his diet.

In the Ardennes the diet is not quite so good, but is superior to that of the Flemish peasant (*vide* Official Agricultural Report of 1856).

In rural communes, where the people are industrious in the Pays de Wues there is little or no poverty. This is not the case, however, in the rich and manufacturing town of St. Nicholas, the chief town of the district, containing 25,000 inhabitants (many of whom are landed proprietors).

This town literally swarms with beggars; in winter 13,000 persons, I am told, are dependent upon charity. Other towns in the district have probably as many poor in proportion to their population; for throughout the whole year numbers of beggars rove through the country districts insulting and even threatening the farmers, who, if they do not give money, rarely refuse a crust of bread.

Taking into consideration the difficulties the small farmer in the Pays de Waes has to contend with in the tenure of his land, it will be readily understood how anxious he must be to retire from his labours as soon as he has obtained a sufficiency to admit of his so doing, instead of endeavouring to improve his system of farming, rearing good stock, &c. In fact, as my informant stated, he is worn out with toil and anxiety, and glad to escape from a position in which he has been at the mercy of unscrupulous and greedy persons seeking only their own interest.

With the facilities for purchasing land in Belgium (unless a monopoly be granted to the peasant class) and owing to the extreme subdivision of the land, it is only natural that it should in very many instances, fall into the hands of a class such as I have depicted, who are instigated solely by motives of gain in their dealings with their tenants, whom they, to use an expressive French term, "exploiter" to the utmost of their power.

M. de Hoon, in a work on the polder lands, expresses his hope that the farms there will remain large, as the land is neither suited for "petite culture" nor the country, which is unhealthy, fitted for a large population.

M. de Hoon says:—

"As the farms become smaller, we shall have more cattle, more manure, and more produce; but the general expenses resulting from an increased number of families will have augmented also. These little properties will, by degrees, pass into the hands of rich proprietors. More labour will be necessary, and there will be less money to spend; illness due to crowding and misery, at present almost unknown, will gain ground. The charitable funds will become a severe tax, and mendicity and marauding will completely change the scene."

The inhabitant of the polders, according to M. de Hoon, is better educated than the inhabitant of Flanders (*i.e.*, where the "petite culture" prevails—for the polders are also in the Flanders). He says he likes conversation and even reading, and contrasts the condition of the former on retiring from business very favourably with that of the latter, who has been unable to devote any of his time to the development of his intellectual faculties. In conclusion, I must add that what what I have described as existing in the Pays de Waes is exceptional; for though in some other parts of Belgium there are many tenants at will, the majority even of the smaller tenants hold written leases of three, six, and nine years.

The information which I have obtained on the Pays de Waes (and which I have every reason to believe is accurate) differs from the pleasant picture of "peasant proprietors" in the above district, drawn in Mr. Mill's work on Political Economy, vol. i, pages 327 to 330.

A glance at the Table inclosed in the earlier part of this Report will show that the land in the Flanders, the most highly cultivated provinces in Belgium, is almost entirely worked by tenants, whereas in the province of Luxemburg, where much of the land is poor and of but comparatively little value, it is mostly cultivated by proprietors.

I think I am justified in inferring from these facts that the soil is in the first place

made productive by the toil and labour of the peasant as owner, and that it eventually falls into the hands of another class who buy land as an investment for their money, and who find it is more remunerative and profitable to let it out to tenants, than to cultivate it themselves.

I believe I am correctly informed when I state that as a rule the small farmer, artizan, or labourer, who is an owner, owns his cottage and a small plot of land (about half a hectare in extent). If he does not earn his bread almost entirely in some industrial pursuit, he hires land in addition to what he owns. In many cases land is an auxiliary means of subsistence to what is gained by industrial pursuits; in others, the proceeds from industrial pursuits are an auxiliary to the profits resulting from the cultivation of the soil. For instance, in M. de Hoon's work I find that there are near Ostend some small farmers owning their own farms of small extent, but who combine fishing with their agricultural labours; so also in the Pays de Waes, and throughout the greater part of the Flanders, flax is the staff of life. In the Campine many are pedlars; in the Condroz country many villages are engaged in straw-plaiting, &c.

Much of the land in Belgium is owned by the aristocracy; much by the industrial classes.

The prevalent opinion in Belgium is in favour of the subdivision of land, and of small holdings; the latter are particularly favourable to high rents. I have, however, heard the opinion expressed by a person thoroughly conversant with the agricultural status of Belgium, that the excessive subdivision was injurious to agriculture, and a regret expressed that there was no law prohibiting the subdivision of properties of 15 hectares in extent.

The law regulating the equal partition of property, though it breaks up large fortunes equally affect the small. The death of parents, who through their toil and industry have succeeded in saving sufficient money to purchase a small house and a few hectares of land, entails in all probability the sale of the property in order to carry into effect the division as laid down by law, amongst the family; sometimes an arrangement is arrived at by which one or two of the sons keep the house and land, paying an indemnity to their brothers or sisters: but this is a matter of difficulty, and children of parents who have raised themselves to the position of small proprietors, are all reduced at the death of the parents to the humble station from which the latter started.

The Belgian is averse to the very idea of emigrating; sooner or later, however, he will be forced to do so, for in Belgium the population, both rural and urban, increases rapidly.*

I regret that I have been unable to procure any statistics as to the annual increase of population amongst small rural proprietors, none having as yet been published upon this point; but I have been informed that the small farmer in Belgium looks upon children as a blessing, as forming in course of time an additional supply of labour to his farm, and when there are more children than the land can support, they seek their living elsewhere. I have not heard any remarks in support of a certain theory that proprietorship tended to prevent the "undue multiplication" of families; but I have heard the opinion that the existing law for service in the army and militia tended to prevent very early marriages.

I have annexed a Table showing the number of marriages solemnized within a certain number of years, and giving the ages of the persons when married.†

No attempts have been made by Government to create or increase the number of freeholders in Belgium (beyond the endeavour which I have stated to colonize the Campine and which failed), such a scheme is looked upon as impracticable, and as one which would only lead to forming a class of persons who would always be looking to Government for assistance.

I annex a Table showing the number of markets and fairs which are held in Belgium.

In 1846 there were 294,537 horses, and in 1856, 277,311, in Belgium. Sheep had likewise decreased in the same period. In 1846 they numbered 662,508; in 1856, only 583,485. Pigs had also decreased.

Cattle, however, has increased in number; according to the census of 1846 there were 1,203,891 head, and in 1856 there were 1,257,649 head of cattle. The "petite culture" favours keeping of cattle, but tends to decrease that of horses and sheep.

I have inclosed in this Report a copy of the form of lease granted by the hospital of St. Jean, at Brussels; this hospital (as do all the charitable institutions owning land in Belgium) lets its lands by public tender; the lease runs for three, six, nine years, and I am informed that this is the usual form of lease granted by proprietors throughout the Province of Brabant.

* In 1867 the total number of emigrants from Belgian ports amounted to 8,198; in 1868 it only amounted to 1,512, 779 of whom went to the Argentine Provinces.—("Moniteur Belge" of November 23, 1869.)

† The difficulties, through consent of parents being required, and other stringent formalities, are a great restriction to early marriages.

I have also inclosed a copy of the cadastral map for the commune of St. Giles Waes, together with the register attached to it, as a specimen of a publication from which most accurate information can be obtained as to the nature of the soil in each commune, and as to the ownership, and the amount of tax upon each plot of land throughout the country.

(Signed) HUGH WYNDHAM,
Second Secretary, Her Majesty's Legation in Belgium.

December 6, 1869.

Annexes.

The number of fairs and markets in the Provinces of Belgium in 1860 were as follows:—*

Province.	Weekly.	Monthly.	Annual.	Total.
Antwerp	66	12	102	180
Brabant	49	3	74	126
West Flanders	77	9	116	202

On Outgoing and Incoming Tenants.

Relations between the outgoing and incoming tenant vary very much in different parts of the country.

The following are the customs most in force in each province:—

Province of Antwerp.—Leases generally take effect on the 15th March. The outgoing tenant leaves to his successor one-third of the land under tillage, and holds the other two-thirds over the harvest without paying rent for it. As a rule there are no claims for manure or ameliorations; occasionally, however, the outgoing tenant leaves to the incoming tenant the dung and straw which are on the farm at the time that he quits. In some places the crops and manure in the soil are valued by valuers, and the new tenant indemnifies his predecessor. This is all arranged without the intervention of the landlord.

Brabant.—In some localities the farmers on quitting have no right to any sort of indemnity for improvements upon the farm, while in some cases they can claim indemnity

for manures, the seeds in the ground, and the cost of the labour of sowing, &c. Sometimes the outgoing tenant receives half the crops on condition of manuring, working, and sowing the land during the last year of his lease.

His successor receives the other half of the crops, plants, potatoes, sows oats, gathers in the hay, and pays the rent and taxes.

In the sixth district the incoming tenant pays nothing for the manures, nor has he any right for indemnity on this score on leaving.

This practice impoverishes the soil to such an extent that it requires two or three years to get it into order again.

West Flanders.—In a part of this province the outgoing tenant leaves the manure and straw to his successor, who takes them at a valuation. The latter also pays an indemnity for manures (permanent), which indemnity varies according to localities and the nature of the manures. Though as a rule no manures exist after two consecutive crops. In all cases the oil cakes ("les tourteaux") used as manure for tobacco are valued after the harvest at an eighth or tenth of their original value, and guano at one-third after the summer harvest, and at one-fourth after the winter harvest. Lime is considered as an improvement which lasts for five consecutive years; it is valued after the first crop at $\frac{15}{21}$ of its original value, and then successively at $\frac{10}{21}$, at $\frac{6}{21}$, $\frac{3}{21}$, and $\frac{1}{21}$ of that value after second, third, fourth, and fifth crop respectively.

The buildings generally belong to the tenant, so that on his entering upon the land he pays an approximate value to his predecessor, which is usually settled by valuation ("estimation contradictoire") made in most cases by notaries.

In some localities the outgoing tenant must, during the last year of his lease, allow the new tenant to sow clover, and he must provide for the lodging of the latter's labourers and horses. In some cases he must give over all the manure which may be on the farm at a valuation fixed by valuers.

In the Furnes Ambacht district he has no right to indemnity on this score.

In the eighth district the outgoing farmer sells all he can carry away.

The crops on the land are valued either by the parties themselves or by a notary.

In the ninth district, when a tenant leaves a valuation is generally made of the manures, in conformity with certain regulations of the "Chatellenie of Courtrai," dated 5th July, 1703, and October 1671. These regulations have been modified by circumstances and custom, and the principal modifications are set forth in the Convention of the Chamber of Notaries in the district of Courtrai, dated 4th May, 1853.

In the tenth, eleventh, and twelfth districts a valuation is made of the land, woods, and manure, and the incoming pays the outgoing tenant the value thereof.

The following customs also obtain:—The outgoing farmer causes all the manures and crops which his successor may wish to take over to be valued. The latter may accept the valuation at a winter value ("en valeur d'hiver") in the middle of March, or at a full value at the feast of St. John ("à la St. Jean") subject in both cases to paying the entire rent, during the current year, or of only entering upon the farm on the 1st of September. In this case the outgoing tenant pays two-thirds of the rent of the current year.

East Flanders.—In this province a regulation which bears date 17th October, 1671, is still in force with regard to the rights of outgoing and incoming tenants. This regulation, which constitutes the written customs of the ancient Chatellenie of Ghent, is still obligatory in a great portion of the province.

As the greater part of its Articles no longer harmonize with the laws which now regulate property, or with the system of agriculture which prevails during the present day, a revision of the code is much called for.

The following are the customs most generally followed when a farm passes from one farmer to another:—

The outgoing farmer sows all the autumn crops for which he receives an indemnity valued by experts; if there are arrears of rent this indemnity goes towards paying them off.

The outgoing farmer takes the underwood which is in the hedgerows; this underwood is valued by toises of $\frac{3}{60}$ when it has not obtained a six years' growth. If the wood is of an older growth he may cut and dispose of them, unless his lease stipulates to the contrary.

These conditions fulfilled, the new tenant enters upon the land towards the middle of March, and takes possession of the buildings at the commencement of April.

In the sixth district, the outgoing tenant receives indemnity from his suceessor for his manures and for the cost of labour and seeds.

This custom gives rise to many difficulties which are generally sought to be avoided by stipulating in the leases the quantity of manure which the outgoing tenant is to place.

upon the land during the last two years of his tenancy. Experts are appointed to see that the farmer fulfils his contract.

Hainault.—As a general rule, the outgoing tenant leaves to his successor the straw and manure, and allows him to sow clover on a portion of the land. The parties come to an understanding in general as to the indemnity to be paid by the new farmer to the outgoing tenant Sometimes it is stipulated in the lease that a tenant, on leaving, may not sell his standing crops, that they must be thrashed out on the farm, where the straw and manure is to be left.

In some places the incoming farmer has a right to expect housing for his labourers and stock, straw on the farm, and a certain amount of fallow land.

On large farms the outgoing farmer gives up the unconsumed straw and the manure which has not been made use of, as well as the portion of land destined as fallow. Where the cultivation is divided ("culture divisée") it is generally customary to allow the incomer to sow clover on a portion of the wheat land of winter and of March ("emblavures d'hiver et de Mars"), as also to work the land after gathering in the first crop of the last year. Clover is considered as fallow.

Province of Liege.—Leases generally take effect 15th March or 15th May. In the first case the farmer has the right on quitting to the winter crops; in the second, he has also the March crops.

This custom only prevails in the district of Liege. Sometimes the outgoing tenant sows the winter crops, of which he receives the half of the produce in grain the year that he leaves, the other half and the straw remaining to the farm.

The cutting and housing the crops are done by the incoming tenant. The expense of thrashing is divided. In a part of the Condroy the outgoing tenant does the primary labour, carts the manure, and sows clover on the land destined for wheat.

The new tenant pays for the seeds. He is, moreover, bound to house and carry the grain crops ("les durs grains") for which his predecessor pays two-thirds of the rent.

When a tenant is to leave on the 15th of May the outgoing farmer disposes of the manure up to the 1st of November. He sows the spring wheat, which he harvests, as also the winter cereals.

The incomer does the carting, sows clover with the cereals, which are reaped by his predecessor, and plants potatoes. In the Herve country the outgoing tenant has, in general, no right to any indemnity, no matter what money he may have sunk or improvements he may have made.

In some parts he can claim the grain, but the straw and manure must remain on the farm.

Finally, in the canton of Spa, the outgoing tenant leaves to his successor all the forage which may be on the farm at his departure, or such quantity as may have been stipulated in his lease, as also all the manures. He is bound also to till and sow winter crops on an extent of land equal to what he found on taking the farm. In some cases the outgoing tenant, who may have found nothing sown on entering upon the farm, must place at the disposal of his successor the land destined for winter sowing.

Limburg.—Leases generally commence on the 15th of March, for buildings and pasture lands; and on the 15th of August for arable lands.

It is generally stipulated that the farmer, either on entering or leaving, has a right to some of the grain sown, and which constitutes generally about two-thirds of the crop. Some leases allow the incoming tenant half of the grain which he finds sown, and which quantity, on leaving, he must leave to his successor; the straw and manure, however, remain upon the farm. In some places the new tenant does the harvesting; threshing is done at the expense of both, and a division is made in accordance with the proportions stipulated in the leases.

Sometimes also the outgoing tenant is in no way bound as to his successor; nor is he obliged to leave either straw or seed of any kind; the land is thus completely worn out In the eleventh agricultural district the outgoing tenant takes everything except manures and straw. He must leave a certain amount of fallow land for his successor, calculated according to the extent of the farm.

Luxemburg.—In the neighbourhood of Arlon, straw, manure, and most of the green crops are left upon the farm. In some places the new farmer takes over the fallow land, the permanent and artificial grass lands; he must repay to his predecessor the value of the grass seeds. He has the benefit of all manure from the 1st of May to the 3rd of November, and of the straw and green crops which are on the farm on the 1st of May.

His predecessor may take nothing away. Where sheep are fattening the farmer may keep on his flock from the 1st of May, the day he quits, to the 1st of November, while lambs must be taken off the farm at the close of the lease.

In the Ardennes (7th, 8th, 9th, 10th, 12th, 13th, and 14th agricultural divisions) it is customary for the outgoing-tenant to sow the winter and spring cereals, and to harvest and thresh them. The corn belongs to him, the straw to his successor. He may not carry away green or root crops.

No indemnity is granted him for improvements.

The incoming-tenant has a right to the produce of the farm dating from the autumn sowing, and his successor must give him up sufficient land for planting potatoes.

As he generally finds a certain quantity of grass and straw on entering upon the farm, he engages to leave it when he goes out.

In the Canton of Wellin the outgoing-tenant takes his crops and his live and his dead stock.

The incoming-farmer must wait a year, and even eighteen months before he can enjoy any of the produce, or obtain any returns except from hay and pasture.

Province of Namur.—Leases generally commence on the 1st or 15th of May, in the southern part of the province. The outgoing-tenant has no right to dispose of the manure after the 1st of November of the year which precedes his quitting. He is bound to sow for his successor a certain amount of spring seeds and crops as stipulated in the lease; for this he receives his expenses.

The new tenant is bound to facilitate the harvest of the wheat crops, which belong to his successor, and to leave him a place fit for stacking and threshing. The straw remains on the farm.

In the 7th and 8th districts the incoming-tenant is bound to get in the harvest, and to leave the barns at the disposal of his predecessor for the term of one year.

In the Canton of Beauraing the outgoing-tenant leaves on the farm the manure made from the 1st of November.

He leaves also the green crops, and straws of the winter crops, of which he retains the grain, also that from the March sowings, which he sows before leaving; the straw remains to the farm. The incoming-tenant harvests the natural and artificial grass crops, and must reimburse the cost of the artificial seed to his predecessor.

In the Entre Sambre and Meuse the incoming-tenant takes over the meadows or one-third of the arable land, as also the straw from the last harvest, and the manure made from the 1st of November of the preceding year.

In some places the outgoing tenant leaves the straw and manure to his successor and keeps the winter and March cereals. The incoming tenant takes possession of the buildings, he has the hay and the grass crops, but must indemnify the outgoer for the seeds. He is bound, moreover, to carry all the harvest.

Cahier des charges, clauses et conditions auxquelles le Conseil Général d'Administration des Hospices et Secours de la ville de Bruxelles fera procéder par le ministère d'un notaire, à la location publique, aux lieu, jour et heure à fixer, de divers biens ruraux dont la désignation sera faite au procès-verbal de la location.

Art. 1. La location a lieu pour un terme de neuf années consécutives, qui prendra cours le 30 Novembre, 1860.

Cependant il sera facultatif à l'Administration des Hospices seule, de résilier le bail, à la fin de la troisième ou de la sixième année, en faisant renou par exploit d'huissier, six mois avant l'échéance de chaque époque triennale.

Art. 2. Si les biens donnés en location venaient en totalité ou en partie à être échangés, vendus, ou à être exploités comme briqueterie ou comme carrières de pierres ou de sable, de même que s'ils venaient à être trouvés nécessaires à l'utilité publique, l'Administration aura le droit, en tout temps, de résilier le bail en tout ou en partie, et de faire abandonner les biens par les locataires, moyennant de les prévenir deux mois d'avance.

Dans ce cas les locataires auront droit à une indemnité de labour et de semailles qui sera fixée entr'eux et les nouveaux propriétaires ou occupants; à défaut de s'entendre, elle sera fixée conformément au mode d'expertise tracé par l'Article 34 du présent Cahier des Charges; aucune autre indemnité ne pourra être exigée par eux.

En cas d'expropriation, le locataire recevra l'indemnité qui aura été payée pour cet objet à l'Administration.

Si, avant la date fixée pour l'entrée en jouissance, tout ou partie des biens venait à être échangé ou vendu, ou à être exploitée comme briqueterie ou comme carrière de pierres ou de sable, de même que si, avant la dite date, tout ou partie des mêmes biens venait à être

trouvé nécessaires à l'utilité publique, le bail sera considéré comme nul et non avenu, pour les parcelles ou parties des parcelles dont il devrait être disposé, sans que les locataires puissent réclamer, de ce chef, aucune indemnité envers qui que ce soit.

Art. 3. Les preneurs ne pourront exiger aucune indemnité pour le cas où les locataires actuels prétendraient avoir le droit d'occuper les biens compris dans la présente location au delà de la date fixée pour l'entrée en jouissance ; il en serait de même si, par suite de quelque différend, ou pour tout autre motif, l'Administration des Hospices ne pouvait mettre ou maintenir les preneurs dans la jouissance des biens loués, sauf aux preneurs à exercer leurs recours contre les tiers, sans intervention ni indemnité de la part de la dite Administration.

Art. 4. Toutes espèces de contributions et charges publiques, quelles que soit leur dénomination, seront supportées par les preneurs, pendant toute la durée du bail.

Les contributions foncières seront notamment à charge des preneurs pour toute l'année, du moment que celle-ci est commencée pendant leur jouissance, quand même ils viendraient à abandonner le bien loué avant la fin de l'année, soit par suite d'expiration du bail, soit pour violation de l'une ou de l'autre de ses conditions, ou pour toute autre cause que ce soit. Aucune indemnité quelconque ne pourra, de ce chef, être exigeé par les preneurs.

Ceux-ci seront tenus de justifier annuellement du paiement des contributions, au Receveur-Général de l'Administration des Hospices ; à défaut par les preneurs de fournir cette justification, le Receveur-Général exigera, en vertu de la grosse des présentes, le paiement des contributions de la manière et dans la forme établies pour le recouvrement des fermages.

Art. 5. Les preneurs auront la jouissance des biens dont la location leur sera adjugée, ainsi que ces biens se poursuivent et se comportent, sans garantie de la mesure indiquée, dont le plus ou le moins leur fera profit ou perte. Ils seront censés connaître ces biens comme les ayant vus et visités, sans qu'il soit besoin de plus ample désignation.

Ils devront conserver les biens dans leurs limites et contenances, sans permettre qu'aucune borne soit déplacée, ni qu'il soit fait aucune usurpation ou aucun empiètement sur les biens loués, soit par les voisins, soit même par l'autorité publique, s'il s'agit d'un chemin.

Si pendant la durée du bail ou à son expiration, il était trouvé que les preneurs auraient laissé empiéter sur les biens loués, la perte serait récupérée aux dépens des preneurs, et les bornes replacées à leurs frais.

Il est expressément défendu aux preneurs de changer la nature des biens, et d'en confondre la culture avec celle d'autres biens étrangers, comme aussi de faire aucun échange de jouissance, et ce, sous peine de devoir payer, à titre de pénalité, une somme équivalente au prix d'une année de fermage.

Art. 6. Les anciens locataires ne seront pas admis à enchérir, s'ils ne justifient du paiement intégral des fermages échus.

Les nouveaux amateurs qui se présenteront pour louer ou pour enchérir, de même que les personnes qui s'offriront pour co-locataires, devront fournir la preuve constatant qu'ils sont suffisamment solvables.

Art. 7. Les preneurs devront entretenir à leurs frais tous les chemins vicinaux et communaux, ainsi que les grandes routes, fossés, rivières et ruisseaux qui environnent ou traversent les biens compris dans leurs baux, et notamment les fossés des prairies clôturées, et supporter à la décharge des hospices, les travaux frais, journées et corvées, ainsi que les amendes qui peuvent incomber de ce chef. Ils devront, en outre, échemiller les haies et les hurées, et satisfaire à tous les réglements de police à ce relatifs.

Art. 8. Ils devront labourer, fumer et ensemencer les terres en temps et saisons convenables, et y mettre, pendant les neuf années de jouissance, au moins trois engrais complets, dont un pendant les trois dernières années.

Ils devront cultiver par soles et saisons, et suivre les règles habituelles les plus avantageuses pour culture.

La culture des céréales et des plantes fourragères doit être la règle ; les preneurs ne pourront semer, ni planter pendant les deux dernières années de leur bail, des carottes, navets, chicorées ou autres plantes épuisant le sol. S'il résultait, d'une expertise faite conformément aux règles tracées par l'Article 34, que les terres ne sont pas cultivées conformément aux règles d'assolement, ou qu'il y a abus de jouissance, le preneur devrait payer à l'Administration, outre le fermage ordinaire, une année de fermage, à titre de pénalité. Les frais d'expertise seront payés par la partie succombante.

L'Administration aurait en outre la faculté d'user des droits énoncés à l'Article 38.

Les locataires devront tenir les prairies bien saignées et rigolées, arracher les ronces et les épines, enlever les cailloux et les pierres, défaire les taupmières et en éparpiller les

terres, préserver les biens loués de tout cavins, et en général ils devront porter aux biens loués les soins de bons et loyaux fermiers.

Art. 9. Les preneurs seront tenus de cultiver par eux-mêmes ; ils ne pourront, sans le consentement écrit de l'Administration des Hospices, céder leur bail, ni en totalité ni en partie, sous peine de nullité de la cession et de paiement, outre le fermage ordinaire, d'une année de fermage à titre de pénalité.

Art. 10. Les preneurs seront tenus de payer leurs fermages à M. le Receveur-Général de l'Administration des Hospices, en son bureau à Bruxelles, en espèces métalliques d'or ou d'argent ayant cours légal en Belgique, le 30 Novembre de chaque année, excepté le fermage de la dernière année de jouissance, lequel sera payé avant l'enlèvement de la récolte, et, au plus tard, le 1 Juin de la dite année.

Art. 11. L'Administration des Hospices pourra disposer, sans indemnité et comme bon lui semblera, des arbres et têtards existant et croissant sur les dits biens, qu'ils soient plantés par elle ou par les locataires.

Les preneurs n'auront aucun droit à l'étayage des arbres montants et de haute futaie. Cet étayage se fera par les ouvriers de l'Administration et à son profit.

Les arbres qui viendront à se dessécher, ou qui seront abattus par le vent, demeureront la propriété de l'Administration des Hospices, qui en disposera à son gré.

Les preneurs seront responsables des arbres plantés sur les biens qui leur seront loués si, dans les vingt-quatre heures d'un débit commis, ils ne le font pas constater ; ils devront dans ce cas faire remplacer, à leurs frais, les arbres qui auraient été maltraités, brisés, coupés ou enlevés, et payer en outre, sans mise en demeure, à la caisse de M. le Receveur-Général des Hospices, la valeur des arbres à remplacer, estimée comme arbre croissant. A défaut par les parties de s'entendre sur cette évaluation, elle aura lieu par expertise, conformément au mode tracé par l'Article 34, et aux frais des preneurs.

Art. 12. Il sera libre à l'Administration des Hospices de faire en tout temps, sur les biens loués, telles plantations que bon lui semblera. Les preneurs seront tenus de creuser les fosses nécessaires pour des plantations et de faire le transport des arbres ; ils devront garnir les jeunes arbres d'épines et des défenses nécessaires à leur conservation, et les représenter, à la fin de leur bail, en bon état de croissance, le tout à leurs frais et sans indemnité. Chacun des locataires sera également tenu de faire le transport des bornes nécessaires à l'abornement des terres qu'il tient en location, et ce, à ses frais, sans pouvoir exiger, de ce chef, aucune indemnité.

Art. 13. Les preneurs ne seront admis à prétendre à aucune indemnité pour grêle et incendie, d'autant moins qu'ils peuvent faire assurer leurs recoltes contre semblables sinistres ; ils ne pourront également réclamer aucune indemnité pour gelée, inondations, sécheresses, ou autres cas fortuits, prévus au imprévus.

Art. 14. Ils ne pourront, sans autorisation, conduire dans les prairies des chèvres ou autre bétail nuisible.

Art. 15. L'Administration des Hospices se réserve le droit d'exploiter à son profit la tourbe qui pourrait se trouver dans les biens affermés, en indemnisant les fermiers à raison de 37 centimes par an, pour chaque surface de 25 mètres carrés qui sera employée à cette exploitation.

La marne que les preneurs tireront des terres ne pourra être employée qu'à l'amélioration des biens qu'ils tiennent en location de l'Administration des Hospices, et à l'expiration de leur bail ils devront, si cette Administration le juge convenable, combler et niveler à leurs frais les fosses qui auront été creusées pour l'extraction de la marne.

Art. 16. Dans la dernière année de jouissance, les preneurs devront abandonner les terres ensemencées après la dépouille de la récolte, ce qui devra être effectué au plus tard le 15 Septembre de la dite année, pour les fruits durs, tels que l'orge d'hiver, le seigle, le froment, et le colza, et le 1 Novembre suivant, pour tous les autres fruits, ils devront abandonner leurs terres, sans pouvoir exiger aucune indemnité ni diminution de fermage pour les fruits qui n'auraient pas été récoltés à ces époques. S'il arrivait que le présent bail fut renouvelé avant le 1 Avril de l'année dans laquelle il expire, le locataire sortant serait tenu de permettre au locataire entrant de semer dans ses grains et autres fruits des trèfles, sur le tiers au moins de la contenance de ces biens.

Le locataire sortant pourra profiter de ces trèfles jusqu'au jour de la sortie, mais sous condition de n'y laisser paître ni chèvres ni moutons.

Quant aux prairies, les locataires pourront les occuper jusqu'à la fin de leur bail.

Art. 17. Les pailles provenant des biens présentement loués seront converties en fumier pour leur engrais ; elles sont censées appartenir à l'Administration, conséquemment les fermiers ne pourront les vendre ni les distraire d'aucune manière.

Art. 18. Il sera facultatif à l'Administration des Hospices de faire effectuer pendant la durée du bail, aux biens compris dans la présente location, tels travaux qu'elle jugera de

nature à en augmenter la valeur, et spécialement des travaux de drainage. Les locataires des biens sur lesquels ces travaux auront été faits seront tenus de payer à la dite Administration, à partir du 30 Novembre qui suivra la date de leur achèvement, une augmentation annuelle de fermage, calculée à raison de 6 pour cent de la dépense qui en sera résultée, et devront se conformer, pour le paiement de cette augmentation, aux conditions fixées pour le paiement du fermage même.

Les locataires devront en outre entretenir, à leurs frais, ces travaux en bon état; s'il était trouvé que les réparations nécessaires n'auraient pas été faites en temps utile, les locataires seraient tenus de payer de ce chef l'indemnité qui serait fixée de commun accord, et à défaut par les parties de s'entendre à cet égard, au moyen d'expertise, conformément au mode d'expertise tracé par l'Article 34, et aux frais des preneurs.

Art. 19. Tous les réparations quelconques nécessaires à l'époque de l'entrée en jouissance, ou pendant la durée du bail, aux maisons appartenant à l'Administration et qui se trouvent sur les parcelles formant les Articles des biens des hospices (ou de la bienfaisance) seront à charge des locataires, sans pouvoir exiger de ce chef de l'Administration aucune indemnité ou diminution de fermage. Ces travaux sont évalués, mais seulement pour la perception des droits de l'enregistrement à 15 francs par an.

Art. 20. L'Administration fera assurer contre incendie les dites maisons pour une valeur à fixer par elle, et ce tant à son profit comme propriétaire qu'au profit des preneurs comme locataires; ceux-ci devront rembourser annuellement, et sans indemnité, la prime d'assurances et tous frais y relatifs, et ce, de la même manière et aux mêmes clauses que leurs fermages.

Art. 21. Quant aux constructions n'appartenant pas à l'Administration et qui existent sur les parcelles de terre formant les Articles ces constructions devront être enlevés à la date du 30 Novembre, 186— (date du commencement du nouveau bail); néanmoins si le fond sur lequel elles se trouvent venait à être loué aux propriétaires de dits matériaux, les maisons pourraient être maintenus sur place aussi longtemps que l'Administration n'aurait pas sommé les locataires de les faire démolir: mais une fois cette sommation faite, elles devront être démolies, et les matériaux enlevés, endéans les deux mois de la date d'exploit sous peine de paiement à la caisse des hospices d'une somme de 10 francs pour chaque jour de retard.

Il est expressément stipulé que les preneurs anciens et nouveaux ne pourront prétendre à aucune réduction de fermage, ni indemnité quelconque, du chef de la démolition qui devrait se faire pendant le terme de leur occupation, des maisons dont il s'agit.

Art. 22. Toutes les constructions que les locataires éleveront sur les biens qui font l'objet de la présente location, toutes les constructions qu'ils ajouteront aux bâtiments existants, demeureront au profit de cette Administration, sans que les locataires puissent, à leur sortie, exiger une indemnité de quelque chef que ce soit.

Art. 23. Les preneurs se soumettront, sans indemnité aucune, aux décisions que prendra l'Administration à l'effet de livrer passage pour la culture et la récolte des biens environnants ceux qui leur auront été affermés, comme aussi pour toute autre exploitation des mêmes biens.

Il est entendu qu'ils ne pourront permettre aucun passage sur les biens leur loués, sans l'autorisation de l'Administration.

Pour ce qui concerne les décharges qui leur seraient nécessaires au cas d'enclave, pour l'exploitation des biens loués par l'Administration, ils seront tenus de payer tous les frais et honoraires à résulter des poursuites qui devraient être intentées à cet effet, ainsi que les sommes qui pourraient être exigées du chef des décharges fournies, et ce sans indemnité de la part de l'Administration.

Art. 24. En cas de contestations entre différents locataires, au sujet de l'exécution des présentes conditions, il sera statué par l'Administration des Hospices définitivement, sans recours ni opposition quelconque de la part des preneurs.

Art. 25. L'Administration se réserve la faculté de disposer du droit de chasse sur les biens loués.

Art. 26. L'adjudication aura lieu au plus offrant, et après que le notaire aura demandé, à trois reprises, si personne ne veut surenchérir.

Chaque enchère sera de 10 francs au moins, si le fermage dépasse 200 francs, de 5 francs au-dessus de 100 francs, et de 2 francs lorsque le fermage n'atteindra pas 100 francs.

Art. 27. Les frais de la présente location seront à charge des preneurs et payés immédiatement au notaire après l'adjudication, pour chaque lot séparément, sur le pied du tarif suivant :—

Sur le Fermage Annuel de			Frais de Location.	Sur le Fermage Annuel de			Frais de Location.

Art. 28. Indépendamment de ces frais, les preneurs seront tenus de verser également entre les mains du notaire, au moment de l'adjudication, 1 pour cent sur le montant d'une année de fermage, à titre de frais de bornage.

Art. 29. Les preneurs seront tenus de présenter, au moment de l'adjudication, un co-locataire, qui sera solidairement tenu avec le preneur, à l'exécution de toutes les clauses du bail.

L'Administration des Hospices pourra, en outre, pendant la durée du bail, si elle le juge convenable, exiger une caution.

Les preneurs et leurs co-locataires, domiciliés hors de l'Arrondissement de Bruxelles, devront y élire domicile: à défaut de le faire, ils déclarent élire domicile en l'étude du notaire instrumentant, où il leur sera fait toutes significations requises.

Cette disposition est également applicable aux cautions qui pourraient être éventuellement exigées.

Toutes contestations au sujet des présentes entre l'Administration et les preneurs ou leurs co-locataires, qui ne seraient pas, aux termes du présent cahier des charges, soumises à la décision d'experts seront portées, d'après leur nature et le degré de juridiction qu'elles comportent, devant le tribunal de première instance, ou devant la justice de paix du deuxième canton de la ville de Bruxelles.

Art. 30. Chacun des preneurs retirera à ses frais, pour ce que le concerne, un extrait du présent bail, et consent à ce que l'Administration soit dispensée d'en faire la signification en cas de poursuites, de manière qu'un simple commandement suffira pour l'exécution de tout ce qui est contenu dans les clauses et conditions du présent cahier des charges.

Les preneurs et leurs co-locataires renoncent bien expressément dès-à-présent et pour lors, à toutes les exceptions et à toutes les prescriptions contraires établies par le Code de Procédure Civile.

La présente stipulation a pour objet d'éviter des frais inutiles.

Art. 31. En cas de poursuites en paiement des fermages échus, les fermages de l'année courante deviendront immédiatement exigibles; il en serait de même si la récolte venait à être saisie à la requête d'un tiers.

Art. 32. Il est défendue aux preneurs de vendre la récolte et les fruits sur pied, sans autorisation spéciale et écrite du Conseil-Général de l'Administration, sous peine de paiement d'une année de fermage à titre de pénalité.

Art. 33. A l'expiration de leur bail, ou en cas de résiliation (sauf ce qui est dit au paragraphe final de l'Article 38), les locataires auront droit à une indemnité d'engrais, mais seulement pour autant que le bien soit loué à un autre locataire, et uniquement vis-à-vis de ce dernier, sans pouvoir, de ce chef, exercer aucun droit contre l'Administration des Hospices, soit que le bien reste inoccupé, soit pour tout autre motif.

Les terres sont divisées en trois classes pour la fixation de l'indemnité d'engrais, savoir:—

Première Classe.—Jardins potagers, terres en jachères et terres sur lesquelles on a récolté la dernière année des pommes de terre, des colzas, des trèfles, des fèves et des pois.

Pour ces terres, l'indemnité d'engrais ne pourra être évaluée à plus de 150 francs par hectare.

Deuxième Classe.—Terres sur lesquelles on a récolté la dernière année du froment.

Pour ces terres, l'indemnité d'engrais ne pourra être évaluée à plus de 100 francs par hectare.

Troisième Classe.—Terres sur lesquelles on a récolté la dernière année des navets, de l'avoine, de l'orge, du seigle, du sarrazin, des carottes, des chicorées et des betteraves.

Pour ces terres, l'indemnité d'engrais ne pourra être évaluée à plus de 50 francs par hectare.

Quant aux prairies, et aux terres sur lesquelles on aurait récolté d'autres fruits que ceux designés ci-dessus, les locataires devront s'en rapporter à la classification des experts qui les placeront dans l'une des classes spécifiées.

Art. 34. Toutes contestations entre l'Administration et les préneurs quant aux cas prévus aux Articles 8, 11, et 18, ainsi que celles relatives à l'exécution des Articles 3 et 33, et toutes autres de nature à être tranchées par expertise, seront soumises à la décision sans appel de deux experts, nommée par les parties ; si ces experts ne peuvent tomber d'accord, il sera nommé, à la requête de la partie la plus diligente, un tiers expert par M. le Juge de Paix du Canton où les biens sont situés, et en cas de refus de celui-ci par M. le Président du Tribunal de Bruxelles.

Si l'une des parties restait plus de huit jours, à partir de l'avis donné par l'autre, contre récepissé, par exploit d'huissier ou par lettre chargée à la poste, à désigner son expert, il sera également nommé à la diligence de l'autre, de la manière indiquée ci-dessus.

Si l'un des experts ne se réunissait pas à ses collègues dans le délai voulu, il sera pourvu à son remplacement, dans la forme qui vient d'être déterminée.

Les frais d'expertise seront supportés par moitié par chacune des parties, à moins qu'il n'ait été stipulé autrement par le cahier des charges.

Art. 35. Les nouveaux locataires devront, sans intervention ni indemnité de la part de l'Administration des Hospices, exécuter à leurs frais les conditions réglant l'occupation des locataires actuels, desquelles conditions ils déclarent avoir parfaite connaissance.

Art. 36. Il est défendu au locataire entrant de payer au locataire sortant l'indemnité à laquelle celui-ci pourrait avoir droit pour engrais, ou pour tout autre chef, sans avoir obtenu du Receveur-Général de l'Administration la déclaration que le locataire sortant ne doit plus rien aux Hospices. Si, au contraire, le locataire sortant était débiteur de l'Administration, le locataire entrant paiera au bureau du Receveur-Général le montant de l'indemnité dont il s'agit, jusqu'à concurrence de l'import de la dette de l'ancien locataire.

Art. 37. Il est expressément stipulé que la tacite reconduction n'aura pas lieu à l'expiration du présent bail, qui cessera de plein droit à l'époque fixée.

Si, à cette époque, l'Administration n'avait pas renouvelé le bail, et si les locataires continuaient cependant à occuper les biens, ils ne pourraient pretendre à aucun nouveau terme; mais il leur serait permis de continuer leur occupation jusqu'au 30 Novembre suivant, aux clauses et conditions de la présente location.

Art. 38. Les clauses et conditions du présent cahier des charges, ainsi que celles qui pourraient devoir être insérées au procès-verbal de la location, seront de stricte interprétation, et ne pourront être réputées comminatoires. A défaut par les preneurs de s'y conformer, il sera facultatif à l'Administration des Hospices, si elle le juge convenable, de résilier la location, moyennant un simple avertissement par huissier, et ce sans préjudice aux autres pénalités stipulés dans le bail, ainsi qu'à tous dommages et intérêts.

En cas de résiliation par application de la présente clause, les preneurs ne pourront réclamer ni des Hospices, ni des nouveaux locataires, aucune indemnité pour engrais, ni de quelqu'autre chef que ce soit.

Art. 39. La présente location ne sera définitive qu'après approbation par le Conseil-Général des Hospices et par l'autorité compétente.

Ainsi fait et arrêté en séance du

M. de Boeck's Opinion on the Law of Real Property, Successions, Leases, and Registering of, &c.

Q. 1. Quelle est la loi qui règle la succession et la division des terres après le décès du propriétaire ?—*R.* (A.) Le Code Civil : Livre III, Titre I, " Des Successions," Articles 718 à 892 ; Titre II. " Des donations entre vifs et des testaments." Les chapitres qui dans ce titre concernent les testaments sont :

Chapitre I. Dispositions générales ; Chapitre II. De la capacité de disposer ou de recevoir par donation entre vifs ou par testament ; Chapitre III. De la portion de biens disponibles et de la réduction.—Les dispositions de ces chapitres sont communes aux donations entre vifs et aux testaments.

Chapitre V. Des dispositions testamentaires. — Les dispositions de ce chapitre concernent spécialement les testaments.

Chapitre VI. Des dispositions permises en faveur des petits enfants du donateur ou testateur ou des enfants de ses frères et sœurs.—Les dispositions de ces chapitres sont de nouveau communes aux donations et aux testaments.

Chapitre VII. Des partages faits par père, mère, ou autres ascendants entre leurs enfants.

Chapitre VIII. Des donations faits par contrat de mariage aux époux et aux enfants à naître du mariage.

Chapitre IX. Des dispositions entre époux, soit par contrat de mariage, soit pendant le mariage.

(B.) Le Livre II. "Du Code de Procédure Civile," concernant les procédures relatives à l'ouverture d'une succession. Ce livre comprend—

Titre I. De l'apposition des scellés après décès.
Titre II. Des oppositions aux scellés.
Titre III. De la levée du scellé.
Titre IV. De l'inventaire.
Titre V. De la vente des mobiliers.
Titre VI. De la vente des biens immeubles.
Titre VII. Des partages et licitations.
Titre VIII. Du bénéfice d'inventaire.
Titre IX. De la renonciation à la communauté ou à la succession.
Titre X. Du curateur à une succession vacante.

(C.) Le Code Civil et le Code de Procédure Civile dans les matières sus rappelées ont été modifiés par diverses lois dont on trouvera la nomenclature en note des Articles du Code annoté par Delbecque.

Il faut y ajouter la Loi du 26 Avril, 1865, sur le droit des étrangers de succéder en Belgique.

Toutes ces lois qui précèdent consacrent les principes suivants que nous croyons utile de faire ressortir pour faire connaître brièvement le système des successions en Belgique :—

(1.) Depuis la Révolution Française il n'existe plus en Belgique de biens féodaux. Tous les biens sont soumis à la même loi. Il n'existe plus entre eux d'autres distinctions que celles qui résultent de leur nature de meubles ou d'immeubles (terres ou maisons). —Code Civil, Livre II, Titre I.)

(2.) A la mort d'une personne sa succession forme une personne morale appel e hérédité, composée activement de tous les biens qu'elle délaisse, sans aucune distinction de meubles ou d'immeubles, et passivement de toutes les dettes antérieures ou postérieures au décès. (La personne morale sous-mentionnée est appelée indifféremment hérédité ou succession.)

(3.) L'hérédité est dévolue à un ou des héritiers, qui continuent la personne du défunt, tant activement que passivement, de telle sorte qu'au moment même du décès l'héritier seul ou les héritiers indivisément sont investis de plein droit de la propriété et de la possession de tous les biens, sans distinction, qui composent l'actif de l'hérédité, et sont en même temps chargés de toutes les dettes du défunt, comme le défunt lui-même. L'héritier ou les héritiers sont même tenus des dettes de l'hérédité au-delà des forces de la succession ; mais la loi rémédie aux conséquences fâcheuses de ce principe en permettant à l'héritier de renoncer à la succession ou de ne l'accepter que sous bénéfice d'inventaire. Dans ce dernier cas, l'héritier n'est tenu que jusqu'à concurrence de l'actif de la succession.

(4.) Les héritiers sont ou légaux ou testamentaires.

Quand le défunt laisse des parents en ligne directe (descendants ou ascendants), la loi n'admet pas d'autres héritiers. Il peut dans ce cas avoir aussi des légataires par testament ; mais la loi défend à toute personne de disposer par donation entre vifs ou par testament de tous ses biens au préjudice soit des descendants soit des ascendants. La personne qui se trouve dans l'un de ces cas ne peut disposer que d'une partie. La quotité que la loi réserve aux descendants et aux ascendants, s'appelle " la réserve." La quotité dont le défunt a pu disposer s'appelle " la quotité disponible."

La réserve et la quotité disponible sont fixés par les Articles 913, 914, 915, 1094, et 1098 du Code Civil.

Quand le défunt ne laisse ni descendants ni ascendants, il peut disposer de tous ses biens par testament (Article 916 du Code Civil).

Dans ce cas, le ou les légataires institués pour recueillir tous les biens du défunt, prennent la qualification de légataires universels, et ils sont considérés sous tous les rapports commes les héritiers du défunt (Articles 1003 à 1009 du Code Civil).

A défaut de légataire universel, soit que le défunt n'en ait pas institué, soit qu'en cas d'existence de descendants ou d'ascendants qui acceptent l'hérédité, la loi prohibe le legs universel, la succession est dévolue aux héritiers légaux dans l'ordre indiqué par les Articles 731 à 749 du Code Civil, savoir:—

1. Les enfants ou descendants, sans distinction de sexe ni de primogéniture.

Ils succèdent par égales portions et par tête, quand ils sont tous au premier degré. S'ils ne sont par tous descendants du premier degré, ils succèdent par souche; les descendants d'un autre degré que le premier représentent leur auteur du premier degré (Article 745 du Code Civil).

2. A défaut d'enfants ou descendants la succession est dévolue :

(A.) D'abord, aux père et mère en concours avec les frères et sœurs, ou les descendants de ceux-ci par représentation ; on distingue entre les frères et sœurs germains, consanguins, et utérins (Articles 748 et 749).

(B.) A défaut de père et mère, aux frères et sœurs ou à leurs descendants par représentation ; on distingue entre les frères et sœurs germains, consanguins, et utérins (Articles 750 et 751).

(C.) A défaut de frère et sœur ou de descendants d'eux, aux ascendants les plus proches tant de la ligne paternelle que de la ligne maternelle ; moitié pour chaque ligne. Les ascendants au même degré succèdent par tête (Article 746).

(D.) A défaut d'ascendant dans l'une ou l'autre ligne, la moitié dévolue à chaque ligne revient aux parents collatéraux les plus proches. Les collatéraux au même degré partagent par tête (Article 753).

Les collatéraux sont admis à succéder jusqu'au douzième degré (Article 755).

(E.) A défaut de collatéraux au douzième degré, la succession est dévolue à l'époux survivant (Article 767).

(F.) A défaut d'époux survivant, la succession est dévolue à l'Etat.

Les enfants naturels reconnue ne sont pas comptés comme héritiers, mais ils ont droit à une part dans la succession (Articles 756 et 759).

Ils sont mêmes préférés au conjoint survivant et à l'Etat (Article 758).

(5.) Dans le partage des successions, la loi consacre les principes suivants :—

(A.) L'égalité entre tous les héritiers légaux appelés à recueillir une succession et l'ayant acceptée.

Le principe de l'égalité est poussé si loin que tout héritier doit restituer à la succession tout ce qu'il a reçu du défunt par donation entre vifs, directement ou indirectement ; il ne peut même réclamer le legs fait par le défunt, à moins que les dons et legs n'aient été faits expressément à l'héritier par préciput et hors part et avec dispense de rapport (Article 843). La loi présume que, sauf le cas où le défunt aurait déclaré manifestement le contraire, il a lui-même voulu maintenir l'égalité complète entre tous les héritiers qui ont accepté sa succession.

Il est à noter qu'en aucun cas il n'est permis d'avantager un héritier au delà de la quotité disponible. (Voir ci-dessus.)

(B.) La partage en nature non seulement des meubles mais aussi des immeubles de la succession.

Dans le cas où les immeubles ne peuvent pas commodément se partager en nature, ils sont vendus et le prix en est partagé entre les héritiers.

Le principe est que, dans tous les cas où un partage est nécessaire, les immeubles soient partagés en nature, c'est-à-dire, divisés.

La vente est l'exception et ne doit avoir lieu que lorsque le partage en nature n'est pas commode (Article 827 du Code Civil).

Ce principe, combiné avec la dévolution de toute succession, sans distinction de biens, à tous les descendants ou autres parents sans distinction de sexe ni de primogéniture, a pour but et effet d'empêcher l'accumulation de la propriété foncière sur un petit nombre de têtes et de diviser au contraire la propriété foncière entre le plus grand nombre d'individus possible. Appliqué aux terres, il a pour conséquence la division du sol entre les mains d'un nombre considérable de propriétaires, et de permettre à tout le monde d'acquérir une partie du sol.

Ce système a été introduit en Belgique par la Révolution Française, et dans un but politique. Sous ce rapport il est facile de se rendre compte des résultats qu'il a produits. Sous le rapport économique, ce système contrarie la grande culture.

Cependant, il existe encore en Belgique de grandes exploitations agricoles, particulièrement dans le midi du Brabant et dans le Hainaut, soit parce que certaines personnes

opulentes sont parvenues à conserver ou à acquérir de grandes propriétés, soit parce que des fermiers sont parvenus à louer des terres d'un certain nombre de propriétaires et à les réunir au moyen de baux à ferme dans une grande exploitation agricole.

A cet égard, tout dépend du propriétaire.

Dans certaines localités il a intérêt à affermer sa terre à un fermier qui en cultive déjà beaucoup d'autres ; dans d'autres localities, il a intérêt à les affermer à un petit cultivateur.

1. Il faut noter toutefois—que le partage en nature n'est pas obligatoire.

Les intéressés peuvent sortie d'indivision comme ils l'entendent (Article 985 du Code de Procédure Civile) ; ainsi, s'ils sont d'accord, ils ne sont pas tenus de diviser ou de morceler les immeubles qu'ils possèdent dans l'indivision, par exemple en vendant le tout en bloc, ou en donnant à l'un des héritiers le montant de sa part en immeubles et à l'autre le montant de sa part en autres valeurs d'une autre nature. Le partage ou la division des immeubles en nature n'est obligatoire que lorsque les héritiers ne sont pas d'accord et que ce mode de partage est possible.

2. Que le partage en nature des immeubles n'entraine pas toujours le morcellement des propriétés. Si, par exemple, dans une succession dévolue à deux héritiers, il y a deux terres, chacun en reçoit une et aucune des deux terres n'est morcelée. La loi veut même que le morcellement soit évité, s'il est possible (Article 832 du Code Civil).

3. Que, dans le cas où le partage en nature ne peut avoir lieu sans morceler une terre, la terre n'est divisée (si les copartageants ne sont pas d'accord) qu'après que le tribunal a décidé qu'elle est commodément divisible. Ainsi, en cas de contestation, la loi donne aux tribunaux le soin d'empêcher que les terres ne soient morcelées d'une manière préjudiciable à l'intérêt public et particulier. Avant de se prononcer les tribunaux prennent d'ordinaire l'avis d'experts (Article 824 du Code Civil).

On peut dire qu'il n'existe à cet égard aucune autre règle que l'appréciation des tribunaux, qui doivent dans cette question tenir compte de l'intérêt public et de l'intérêt particulier. Ainsi, la Cour de Bruxelles a décidé le , 1869, qu'une exploitation de située dans la Campine (partie de la province d'Anvers) ne pouvait pas être divisée, parce que la nature du sol ne permettait pas de cultiver par petites parcelles. Le même propriété, si elle avait été située aux environs de Bruxelles, aurait été divisée.

(c.) La loi ne permet pas que quelqu'un s'engage à rester dans l'indivision pour plus de cinq ans, mais cet engagement peut être renouvelé (Article 815).

Q. 2. De quelle manière fait-on légalement la vente, la cession, l'échange, ou la division des terres ? Est-ce par actes distincts ou par un simple enregistrement ? Quel est le coût de ces actes ou enregistrement ?—*R.* Les ventes, cessions, échange et partage des immeubles (et par conséquent des terres) s'opèrent de la manière suivante :—

(1.) La vente, la cession, l'échange ou le partage sont constatés entre les parties par un acte authentique (un acte passé devant notaire ou un jugement). Les actes authentiques sont seuls admis à la transcription (voir ci-après, 3).

(2.) L'acte constatant la vente, la cession, l'échange, ou le partage doit être enregistré sous peine d'amende. L'enregistrement a pour but de donner une date certaine à l'acte et de percevoir un impôt sur l'opération. On peut même dire que la perception de l'impôt est le but principal de l'enregistrement. C'est pourquoi le défaut d'enregistrement d'un acte sous seing privé dans les trois mois de sa date est puni d'une amende, qui consiste dans le paiement du double droit. Les actes notariés doivent même être enregistrés dans un délai plus court, sous peine d'amende contre le notaire.

Les droits d'enregistrement que l'Etat perçoit sont les suivants :—

(A.) Sur les ventes, cessions, et tous autres actes translatifs de propriété des biens immeubles, 4 pour cent de la valeur des dits biens plus 30 pour cent de droits additionnels, ce qui porte la perception totale à 5 francs 20 centimes pour cent.

(B.) Sur l'échange de deux immeubles le droit d'enregistrement est de 60 centimes ou de 78 centimes, avec les additionnels par 100 francs. La taxe n'est perçue que sur l'une des parts échangées. (Loi du 1 Juillet, 1869.)

(C.) Sur les partages de biens de toute nature entre co-propriétaires il n'est perçu qu'un droit fixe de 5 francs 9 centimes (6 francs 61 centimes avec les additionnels).

Au surplus les lois relatives au droit d'enregistrement forment tout un code. La théorie de ces lois est expliquée par de nombreux auteurs. Le livre le plus facile à comprendre est le traité de M. Bastiné. On pourrait le joindre à la présente.

La loi du 1 Juillet, 1869 a réduit le droit d'enregistrement dans plusieurs cas.

(3.) L'acte étant enregistré est soumis à la formalité de la transcription ; c'est-à dire, qu'une expédition en est déposée dans un bureau *ad hoc*, et qu'il est transcrit tout entier dans un registre.

Ce registre est public, en ce sens que tout le monde peut obtenir une copie de tous

les actes qui s'y trouvent. Le coût de la transcription est de $1\frac{1}{4}$ pour cent. Ce droit a été réduit pour certaines mutations d'immeubles par la Loi du 1 Juillet, 1869.

La transcription a pour effet de transmettre la propriété des immeubles à l'égard des tiers.

Par exemple si, par une fraude quelconque, le propriétaire d'une terre vendait cette terre à deux personnes différentes, celle qui la première aurait fait transcrire son acte serait considérée comme le seul propriétaire. L'autre n'aurait de recours que contre son vendeur. Il doit se reprocher d'avoïr traité sans s'être assuré d'abord au bureau de la transcription que la propriété n'était pas vendue.

Il est d'usage de déposer le prix de vente en main tierce jusqu'à ce que la formalité de la transcription soit accomplie.

Le même système de publicité existe pour les hypothèques. Seulement la formalité, au lieu de s'appeler transcription, s'appelle inscription. Tout ce régime est réglé par la Loi du 16 Décembre, 1851, qui se trouve dans le code ci-joint à la suite du Code Civil.

Q. 3. Donne-t-on des facilités spéciales pour faire des emprunts sur terres? Ces facilités sont-elles données par le Gouvernement, des sociétés publiques ou des banques subsidiées par le Gouvernement, ou d'une autre manière, &c. ?—*R.* Non.

Q. 4. Est-ce que les terres sont en général fort grévées, et quel est le taux ordinaire des intérêts ?—*R.* Les terres sont en général peu grevées. Les placements d'argent avec hypothèque sur terre sont les plus recherchés. Le taux des intérêts est en général de 5 pour cent.

Q. 5. De quelle manière s'enregistrent les hypothèques; qu'el est le coût de l'enregistrement et des formalités y relatives?—*R.* De même que le transfert de la propriété, la constitution d'une hypothèque par Convention exige trois conditions :—

(A.) Un acte authentique, d'ordinaire un acte devant notaire.

(B.) Cet acte doit être enregistré. L'enregistrement est encore ici plutôt un impôt qu'une formalité prescrite dans l'intérêt de la chose même. L'hypothèque garantissant un droit d'obligation, il est perçu sur le montant de l'obligation un droit de 1 franc pour cent, avec 30 centimes de droits additionnels.

(C.) L'acte authentique enregistré pour avoir de l'effet à l'égard des tiers doit être inscrit sur les registres du bureau de la conservation des hypothèques.

L'hypothèque ne prend son rang qu'à dater du jour de l'inscription. (Voir Articles 81 à 91 de la Loi du 16 Décembre, 1851, sur le régime hypothécaire. Cette loi se trouve à la suite du Code Civil.)

Q. 6. Quelle est la nature de la location, sa durée ordinaire, et les principaux incidents qui s'y rattacheut? Les sous-locataires peuvent-ils céder leur bail, et, dans ce cas, le bailleur doit-il consentir à la cession?—*R.* Le bail à ferme est un contrat entre le possesseur du sol et un fermier, par lequel le premier s'oblige à faire jouir le second d'une propriété rurale pendant un certain temps et moyennant un certain prix. (Les règles du bail à ferme sont indiquées dans le Code Civil dans les Articles 1714 à 1751, et 1763 à 1778.)

Le bail ne donne au fermier aucun droit réel sur l'immeuble. La durée ordinaire des baux est de neuf ans. Quand il s'agit d'une ferme d'une grande importance, le bail est quelquefois convenu pour douze, quinze, ou même dix-huit ans.

Quand il s'agit d'une exploitation de peu d'étendue, par exemple d'une simple pièce de terre sans bâtiments, elle est souvent donnée à bail sans écrit et sans terme convenu.*

Un bail de plus de neuf ans ne peut être opposé aux tiers s'il n'est transcrit au Bureau de la Conservation des Hypothèques (Article 1 de la Loi précitée du 16 Décembre, 1851).

Le droit de sous-louer ou de céder son bail est réglé par la convention des parties. A défaut de convention à cet égard, le fermier peut sous-louer et céder sa terre (Article 1717 du Code Civil), à moins que le bail n'ait été donné à la condition d'un partage de fruits avec le bailleur (Article 1763); mais ce dernier genre de bail n'est nullement usité. Aucune loi n'oblige le bailleur à consentir à une sous-location ou cession, si le contraire n'a été convenu.

Q. 7. Les baux se font-ils verbalement ou par écrit? En l'absence d'un écrit, quelle est la durée fixée ou présumée par la loi pour l'occupation?—*R.* Les baux d'une certaine importance son faits d'ordinaire par écrit; les autres sont faits d'ordinaire verbalement.

* Quelquefois pour les propriétés rurales de peu d'importance les bailleurs agissent comme pour les maisons de la ville et les louent pour trois, six ou neuf ans, avec faculté de résiliation pour le locataire à l'expiration de chaque triennal.

Le bail fait sans écrit d'un fonds rural est censé fait pour le temps qui est nécessaire afin que le preneur recueille tous les fruits de l'héritage affermé.

Ainsi, le bail à ferme d'un pré, d'une vigne, et de tout autre fonds dont les fruits se recueillent en entier dans le cours de l'année, est censé fait pour un an.

Le bail des terres labourables, lorsqu'elles se divisent par soles ou saisons, est censé fait pour autant d'années qu'il y a de soles.

Ce sont les termes de l'Article 1774 du Code Civil. Par soles ou saisons, la loi indique l'usage suivi dans certaines contrées de laisser une partie d'une terre en friche pendant un ou deux ans, et de ne cultiver chaque année que la moitié ou les deux-trôisièmes de cette terre.

En Belgique ce mode de culture n'est plus suivi ; mais il est d'usage d'engraisser les terres de manière à en retirer plusieurs récoltes successives de différentes espèces (par exemple, pommes de terre, froment, avoine). Les tribunaux décident que, si une terre est cultivée de cette manière, le bail sans écrit doit avoir la durée nécessaire pour que le fermier puisse retirer de la terre le profit de l'engrais qu'il y a mis.

Q. 8. Existe-t-il un système pour l'enregistrement d'une convention écrite? Quelle est la nature de ce système?—*R.* Voyez la réponse à la Question 6.

L'enregistrement est plutôt un impôt. Il a cependant pour effet de donner date certaine au bail sous seing privé.

Si le bailleur vend la terre louée, l'acquéreur ne peut expulser le fermier qui a un bail authentique ou dont la date est certaine, à moins qu'il ne se soit réservé ce droit par le contrat (Article 1743 du Code Civil). De plus si le bail excède neuf ans, il doit être sommis à la formalité de la transcription (Article 1 de la Loi précitée du 16 Octobre, 1851). A défaut de transcription la durée en est réduite conformément à l'Article 1429 du Code Civil, c'est-à-dire, à neuf ans.

Q. 9. Existe-t-il une loi ou coutume quelconque donnant au locataire le droit de rester en possession de la terre aussi longtemps qu'il paie exactement le loyer stipulé ou celui qui doit être fixé par les tribunaux, un contrat, ou des arbitres?—*R.* Non. Le bail étant expiré, aucune loi ou coutume n'oblige le bail à conserver le fermier.

Q. 10. Existe-t-il une loi ou coutume qui autorise le locataire à vendre son droit à la terre louée, avec ou sans le consentement du propriétaire, et, dans ce cas, à quelles conditions?—*R.* Si le bail n'est pas expiré, le fermier peut céder son bail (voir Question 6). Le bail étant expiré, le bail peut obliger le fermier à quitter son exploitation. Si le fermier a fait des impenses (constructions, drainage, engrais) qui ne sont pas indispensables, et qui se trouvent encore en tout ou en partie incorporés au sol, les droits des parties relativement à ces impenses est réglé par leurs conventions. A défaut de convention, le propriétaire ne doit rien payer de ce chef; mais le fermier a le droit, s'il le peut, d'enlever tout ce qu'il a fait, à condition de rendre sa terre dans le même état qu'il l'a reçue. (Voir question No. 17.) Cependant, en ce qui concerne les engrais, il existe dans chaque localité des coutumes qui, à défaut de convention contraire, règlent les rapports du fermier sortant et du fermier entrant. Ces contumes sont indiquées aux pages xlix à liv du Recueil de Statistique Agricole publié en 1862 pour le Gouvernement.

Q. 11. Le loyer est-il payable aux propriétaires en argent ou eu nature, ou par une part dans les bénéfices des produits?—*R.* Le propriétaire et le fermier peuvent régler les loyers comme ils l'entendent. En général tous les fermages sont payés en argent. Il existe peu d'exemples de fermages payés en nature ou au moyen d'une part dans les bénéfices.

Q. 12. Le loyer est-il fixé par coutume, par estimation, ou par adjudication? Si c'est par coutume, quelle est la nature? Est-elle reconnue par les tribunaux? Si le loyer est réglé par estimation, quel est le mode d'opérer? Par qui l'estimation est-elle faite? Le loyer est-il payable par année, par sémestre, ou autrement?—*R.* Les fermages sont réglés par convention entre le propriétaire et le fermier. Le bail étant expiré, le propriétaire traite avec le fermier qu'il veut et le fermier avec le propriétaire qu'il veut. D'ordinaire ces conventions se font sans recourir à l'adjudication publique. Cependant certains établissements publics possédant des terres ont l'habitude de mettre les baux à ferme en adjudication publique. Le bail est accordé au plus offrant, pourvu qu'il présente les garanties nécessaires pour une bonne exploitation. Aucun propriétaire n'ayant de fermier contre son consentement, les fermages ne sont point réglés par la coutume ou par estimation. Le plus communément les fermages sont stipulés payables par année après l'échéance, et non par anticipation, et l'échéance est fixée d'ordinaire au 30 Novembre. Il en est ainsi pour presque tous les anciens baux. Mais depuis quelques années, on

commence à stipuler que le bail à ferme commencera et finira après l'enlèvement de la première récolte de l'année, c'est-à-dire, vers le 15 Septembre. Le paiement du fermage est stipulé alors pour la même époque. Cette convention a pour avantage de permettre au locataire entrant de labourer et d'ensemencer lui-même sa terre pour l'année suivante, et d'éviter les comptes pour reprise de labour et ensemencement avec le fermier sortant et le fermier entrant.

La loi prévoit le cas où il y aurait contestation sur le prix d'un bail verbal dont l'exécution a commencé. Dans ce cas, s'il n'existe pas de quittance, le propriétaire est cru sur son serment, si mieux n'aime le locataire demander l'estimation par experts; auquel cas les frais d'expertise restent à sa charge, si l'estimation excède le prix qu'il a déclaré (Art. 1716 du Code Civil). C'est le seul cas où le prix d'un bail peut être réglé par estimation.

Q. 13. Le propriétaire a-t-il un pouvoir illimité d'augmenter le loyer et de faire déguerpir son locataire en défaut de payer son loyer ou pour infraction au contrat? Peut-il faire déguerpir son locataire pour d'autres causes?—*R.* Le propriétaire, en traitant de la location de sa terre, est libre de demander tels fermages qu'il lui convient, mais il va de soi que s'il ne trouve personne qui consente à donner le prix qu'il demande, il en est réduit à laisser sa terre non-cultivée ou à la cultiver lui-meme. Le propriétaire peut faire déguerpir son fermier en cas de non-paiement des loyers. Il peut encore le faire déguerpir pour toute autre infraction au contrat.

Il ne peut le faire déguerpir pour aucune autre cause.

Q. 14. Quels sont les moyens de procédure par lesquels les droits respectifs de locataires et de propriétaires pour le recouvrement des loyers et autres réclamations sont poursuivis? La loi donne-t-elle aux propriétaires un privilége exclusif sur les autres créanciers?—*R.* Aux termes de l'Article 20 de la Loi du 16 Décembre, 1851, "les fermages des immeubles sont privilégiés sur les fruits de la récolte de l'année, et sur le prix de tout ce qui garnit la ferme et de tout ce qui sert à l'exploitation de la ferme, savoir, pour trois années échues; en outre, pour l'année courante et pour celle qui suivra, et même, si les baux sont authentiques ou si, étant sous signature privée, ils ont une date certaine, pour tout ce qui est à echoir; dans ce dernier cas, les autres créanciers ont le droit de relouer la ferme pour le restant du bail et de faire leur profit des fermages, à la charge de payer au propriétaire tout ce qui serait encore dû.

"Le même privilége existe pour les réparations qui incombent au fermier et pour tout ce qui concerne l'exécution du bail.

"Le propriétaire peut saisir les meubles qui garnissent sa ferme lorsqu'ils ont été déplacés sans son consentement, et il conserve sur eux son privilége, pourvu qu'il en ait fait la revendication dans le délai de quarante jours.

Pour exercer son droit de privilége le propriétaire a recours à la procédure connue sous le nom de "saisie-gagerie," et qui est reglée par les Articles 819 et suivants du Code Civil.

Cette procédure est des plus expéditives.

Dès que le fermier est en retard de payer son fermage, fût-ce d'une heure, le propriétaire peut lui faire notifier un commandement de payer par un huissier; vingt-quatre heures après ce commandement, il peut saisir tous les effets et fruits étant dans les bâtiments ruraux et sur les terres.

Il assigne ensuite le débiteur devant le tribunal pour en obtenir un jugement qui valide la saisie.

Ce jugement obtenu, le propriétaire peut faire vendre les effets et fruits saisis, et se paie sur le prix. Dans les cas urgents, le propriétaire peut même saisir sans commandement préalable, mais en obtenant l'autorisation du juge.

Q. 15. Quel est le mode de procédure par lequel un propriétaire fait déguerpir un locataire? Quel avis faut-il notifier au locataire? Quels sont les moyens de défense du locataire contre le déguerpissement? En cas de déguerpissement pour non-paiement de loyer, un délai est-il accordé au locataire pour se remettre dans son ancienne position?—R. La procédure à suivre pour l'expulsion d'un fermier, soit pour cause d'expiration de bail, soit pour défaut de paiement, est aussi des plus expéditives. Dès que le bail est expiré ou que le fermage est exigible, le propriétaire peut assigner le fermier à comparaître soit devant le Juge de Paix du canton, soit devant le Président du Tribunal de première instance pour le faire condamner à déguerpir. Assignation doit être donnée pour comparaître devant le Juge de Paix si les fermages pour toute la durée du bail n'excèdent

pas 200 francs; dans le cas contraire, elle doit être donnée pour comparaître devant le Président du Tribunal (Loi du 5 Octobre, 1833, et Loi du 25 Mars, 1841).

Entre l'assignation et le jour de la comparution le délai normal est de un jour franc.

Dans le cas de demande d'expulsion pour défaut de paiement, le Juge de Paix ou le Président interposent souvent leur autorité pour faire accorder un court délai au fermier.

Si le fermier se présente à l'audience avec la somme nécessaire pour payer le montant de son fermage et les frais, l'expulsion n'est jamais ordonné.

L'expulsion étant prononcée, le fermier doit partir dans un délai qui est fixé *ex æquo et bono* dans le jugement (ce délai est d'ordinaire de huit ou quinze jours au plus.

Q. 16. Les déguerpissements sont-ils fréquents? Quelle en est la cause?—*R.* On peut dire que les demandes en déguerpissement sont peu fréquentes. Le fermier sachant qu'il doit partir après l'expiration du bail, ne se laisse pas faire de frais, et quant aux paiements de fermages, ils se font d'une manière assez régulière; les propriétaires ne se montrent pas en général trop exigeants pour le paiement précis à l'échéance.

Q. 17, 18, 19, et 20. Les améliorations, surtout en fait de bâtiment, sont-elles faites par le propriétaire ou par le locataire? Si elles sont faites par le locataire, sous quelle garantie? Quand il reprend possession, le propriétaire a-t-il droit aux améliorations faites par le locataire? Ou bien, la loi reconnaît-elle que le locataire a un droit quelconque? Si ce droit existe, comment est-il défini, établi, et exercé?—*R.* Quand la question des améliorations est prévue par le bail, il faut se conformer strictement aux stipulations de cet acte. Pour tout ce qui n'est pas prévue dans le bail on applique les règles suivantes:—

1. S'il est établi que les travaux faits par le fermier étaient nécessaires, indispensables, le propriétaire doit lui rembourser ce qu'il a dépensé. Par exemple, le fermier qui a reconstruit le toit d'une grange, même sans avertir le bailleur, peut réclamer le remboursement de ce qu'il a dépensé.

2. S'il est établi que les travaux faits par le fermier sont seulement utiles ou de pur agrément, il ne peut s'en faire rembourser par le propriétaire qui n'a pas donné ordre de les faire.

3. Dans le cas où le fermier ne peut exiger le remboursement de ses impenses, il a le droit d'enlever ce qui, dans les améliorations qu'il a faites, peut être enlevé, à la charge toutefois de rétablir et de laisser la chose dans son état primitif.

4. Si les améliorations faites par le fermier sont incorporées au fond, le propriétaire peut empêcher le fermier de les enlever et a le droit de les conserver en payant au fermier la valeur de ces travaux. Le fermier n'a pas le droit de retenir la ferme ou la terre après l'expiration du bail, jusqu'à ce que le propriétaire ait payé les améliorations qu'il est tenu de rembourser. Le fermier n'a du chef de ces améliorations qu'une créance ordinaire.

Q. 21. Exerce-t-il des occupations ou locations qui ressemblent aux copyholds, &c.?—*R.* Non, ce genre de propriété n'existe pas en Belgique.

No. 13.*

Mr. Lumley to the Earl of Clarendon.—(Received December 20.)

My Lord, *Brussels, December* 18, 1869.

I HAVE the honour to inclose a Report on the land tenure in Belgium, which has been been drawn up by Mr. Grattan, Her Majesty's Consul at Antwerp, in accordance with the instructions of your Lordship's despatch of August 26.

While Mr. Grattan's position at Antwerp has made him intimately acquainted with East and West Flanders, his information is equally accurate with regard to the other provinces of this Kingdom, and the comparision he has been enabled to draw between the condition of the peasantry of Ireland and of this country will be found to add greatly to the interest of this valuable Report.

I have, &c.

(Signed) J. SAVILE LUMLEY.

---

* See Mr. Lumley's despatches of January 8 and 9, 1870, in Part II of Land Tenure Reports.

Inclosure in No. 13.

Consul Grattan to Mr. Lumley.

Sir, *Antwerp, December* 16, 1869.

HAVING given my careful attention to the Earl of Clarendon's Circular despatch and the annexed paper of queries relating to the tenure of land in Belgium, transmitted to me in your despatch of the 6th of September last, I have the honour to communicate to you herewith, in reply, the results of the information I have been able to collect in egard to this subject.

In order to obtain the data necessary to the accomplishment of the duty confided to me, I have applied to various persons acquainted with the law and possessing practical information on the subject of farming and the occupancy of land in Belgium, consulting also the published Reports of the Minister of the Interior, as well as other special works which treat of the state of agriculture in Belgium. The plan I have adopted in the hope of meeting as fully as possible the objects set forth in Lord Clarendon's Circular despatch, is that of replying in succession to the several queries contained in the paper which accompanied his Lordship's circular, adding thereto a few observations suggested by the general tenor of the despatch, and arising out of the subject under consideration.

Promising, therefore, that the population of Belgium in 1865 amounted to 4,984,351 souls, that the inhabitants profess almost exclusively the Roman Catholic religion, and that the chief industrial pursuits of the people consists of agriculture, manufactures, commerce, and mining, and following the order in which the questions succeed each other in the paper of queries, I reach the subject of—

Land Occupation.

The system of land occupation in Belgium consists of (A) proprietors, and (B) tenant under proprietors, and, to a limited extent, sub-tenants under intermediate tenants holding from proprietors. The total superficial measurement of Belgium according to the census of 1846 was 2,603,036 hectares.*

The lands under cultivation amounted to 1,793,153 hectares, of which quantity 613,570 hectares were cultivated by owners of the soil themselves, and 1,179,583 by tenants.

According to the census of 1856 the total superficial measurement was estimated to amount to 2,945,539 hectares; the lands under cultivation amounted to 1,830,516 hectares of which quantity 628,291 hectares were farmed by proprietors, and 1,202,224 by tenants. Thus about two thirds of the arable lands of Belgium are cultivated by tenants.

The system of underletting not being practised to any considerable extent in Belgium, the number of sub-tenants is not comprised in the official statistics.

(A.)—Small Proprietors.

1. The lands held by proprietors are thus classified in the Report published by the Minister of the Interior in 1850:—

Proprietors farming	50 ares and under	101,584
„	51 ares to 1 hectare	47,726
„	1 hectare to 5 hectares	122,593
„	5 „ to 10 „	33,001
„	10 „ to 15 „	13,290
„	15 „ to 20 „	6,501
„	20 „ to 25 „	3,715
„	25 „ to 50 „	6,388
„	50 „ to 100 „	2,134
„	100 and over	654
	Total	337,586

Thus at that period out of every 100 proprietors, forty-four farmed less than 1 hectare of land, thirty-six farmed from 1 to 5 hectares and nineteen over 5 hectares, and the proportion has probably not varied materially since that time. It is observed also, says the Minister in his elaborate Report, that it is in the poorer and more thinly inhabited districts that proprietors are the most apt to cultivate their own land, and, on the other hand, that the system of letting land to tenants appears to increase notably in the neigh-

* The hectare is equal to 2 acres 1 rood 35 perches.

bourhood of towns, so that in populous districts proprietors farming their own lands become comparatively rare.

In consequence of the extreme sub-division of landed property in Belgium, estates are frequently intersected by other properties.

This is considered a great evil, and at a meeting of the Conseil Supérieur d'Agriculture on the 18th of March, 1867, the subject was discussed at much length.

A Report was agreed to, strongly advocating the reduction of the charges on exchanges of real property ("frais de mutation") as the best means of meeting the difficulty by diminishing the expense of effecting transfers of this description.

According to this Report a law exists in Prussia and some other German States, which compels proprietors of scattered plots of land in any particular commune, when required by a sufficient number amongst themselves, to unite the whole land and submit it to redistribution according to the mutual interests of the parties. These operations, which appear to have been highly beneficial to the landed interests, are termed in Germany consolidations and are of ancient usage, numerous exchanges of this nature having occurred in the principality of Kempten, which now forms part of Bavaria, as far back as the seventeenth century. The members of the Council were generally of opinion that the dispersion of detached plots of land belonging to individuals was undoubtedly injurious to agriculture. It had been estimated that a field situated at a distance of from two to three miles from the farm-house yields no profits, the whole produce being absorbed by the expenses of cultivation and that consequently detached fields of this description ought to be converted into grass lands, or into woods. This subject has been fully treated by Ville Roy and Muller—"Des Réunions Territoriales en Allemagne"—and by H. de Lavellée, "De l'Echange des Immeubles Ruraux en Belgique."

2. The following are the leading principles which govern the descent and division of property, whether personal or real, in Belgium, on the death of the owner. The children of the defunct inherit his property in equal shares, the children of deceased sons or daughters representing their deceased parents. A husband and wife may, in case of their having no children, leave all their property to the survivor, except in case of the deceased leaving a father or mother, in which case one-quarter of the property reverts to each of the latter, though a life interest in these shares may be left to the surviving husband or wife; and should there be children or their descendants living, the married couple may bequeath to each other one-quarter of their property, and a life interest in one-quarter.

Should an unmarried person leave at his decease a father and mother as well as brothers and sisters living, the father and mother inherit together one-half, and the remaining relatives each an equal share of the residue. If there is neither father nor mother, all is divided between brothers and sisters; and if there are neither brothers nor sisters, one-half reverts to the father and one-half to the mother.

In case of there being one parent only and no brothers and sisters living, one-half to the surviving parent and the other half to the nearest relations of the deceased father or mother, in equal shares. All near relatives, such as father, mother, brothers, and sisters, being dead, the property reverts in equal shares to the nearest relatives of the parents of the deceased on both sides. The law allows to all persons the faculty of giving during their lifetime, or of bequeathing by will to any person, any portion of their property not exceeding one-half of their entire estate in case of their having or leaving at their decease but one legitimate child, one-third if they leave two children, and one-fourth if leaving three or more children.

Finally, persons leaving no relatives whatever, possess the full power of disposing of their property as they please.

3. Every sale, transfer, exchange, or division of landed property is effected by a deed drawn up by a notary. The registration ("enrégistrement") of such deeds or conveyances is compulsory, but merely in a fiscal sense, the omission to register entailing simply a fine, but in no way affecting the validity of the deed.

The law, however, requires all deeds relating to the sale or transfer of property to be entered into what are termed the "Régistres Hypothécaires," or register of mortgages, a different process altogether, for the purpose of protecting the interests of third parties ("tiers"), and in order that all charges upon real property should be duly recorded and accessible to persons interested.

The costs for sale and registration amount to	..	5·20	per cent on the value of the property.
And for entry upon the mortgage register	..	1·25	„ „
Amounting in all to	..	6 45	„ „

The costs for exchanges and transfers ("mutations") amount to about 3·30 per cent.

4 and 5. Loans may easily be obtained upon real estate by mortgages negotiated

through a notary, to the extent of about two-thirds of the value of lands and five-eighths of the value of houses.

Landed property in Belgium is very frequently mortgaged, and the rate of interest at which advances may be obtained upon mortgage depends very much upon the value of money at the time. During the war between Prussia and Austria in 1866, the rate of interest upon money advanced on mortgage reached 7 per cent. per annum; the present rate is about 4½ per cent. Loans are sought more frequently for the purpose of facilitating the purchase of land than with a view of making improvements upon properties.

There are two public companies, the "Caisse des Propriétaires" and the "Caisse Hypothécaire," established in Brussels, both of which lend money on mortgage.

The conditions upon which these companies make their advances is that of repayment by annual instalments, which embrace a portion of the capital, interest on the money advanced, and a commission; whereas loans obtained from private persons, through notaries, are usually contracted for a specific term of years, generally ten. The expenses attendant upon raising money by mortgage, including registration and notarial fees, amount to 3 per cent., paid by the borrower.

6. All mortgages are executed in the presence of a notary public, and are officially registered. A copy of the deed of mortgage, besides a "bordereau," or abstract of the same in duplicate, are then produced at the office of the Registrar of Mortgages, "Bureau des Hypothéques;" one copy of the abstract is retained in the office, and the other, with an indorsement specifying that the duplicate has been so retained, is returned to the parties interested, together with a copy of the deed.

The registration duty amounts to 1·30 per cent., and the charge for recording the mortgage 0·12½ per cent. The notary's fees amount altogether to about 8 per cent. upon the sale of a property of from 5,000 to 10,000 francs in value, to 7½ per cent. upon properties of between 10,000 and 30,000 francs in value, diminishing to a minimum of 7 per cent. upon sales of a larger amount.

7. The principal crops raised in Belgium are rye, wheat, oats, clover, barley, flax, buckwheat, hops, chicory, beetroot, potatoes, turnips. The rotation adopted varies according to localities, and depends much upon the nature of the soil and the habits of the population in the different agricultural districts into which the country may be divided. According to the classification adopted in official publications, Belgium is subdivided into six leading agricultural districts. M. E. de Laveleye, in his essay on the agriculture of Belgium, "L'Economie Rurale de la Belgique," distinguishes seven, but it may for the present purpose suffice to indicate the five principal subdivisions referred to in M. de Laveleye's work, viz., Flanders, the Campine, the Hesbaye, the Condroz, and the Ardenne. The first of these subdivisions, Flanders, embraces the two provinces of East and West Flanders, including what may be termed the coast region, which forms an important part of the provinces in question. The latter consists of immense alluvial plains, called "polders" or lands redeemed from the sea by means of dykes, and formed by deposits proceeding from the overflow of the sea and of the Scheldt, along the banks of which river, from Ghent to the sea, the polders extend. The fertility of this district is very remarkable, lands newly embanked producing, according to Van Aelbroeck, superb crops without manure for twenty-five years in succession, or more.

The rotation of crops most in use in the polders combines a period of ten years, and may be described about as follows:—

1st year, barley or rapeseed; 2nd, horse beans; 3rd, wheat; 4th, horse beans; 5th, wheat; 6th, clover; 7th, wheat; 8th, potatoes and carrots; 9th, oats; 10th, fallow-fields. A second crop of turnips is produced after barley. The farms in that region are comparatively large, varying from 20 to 50 hectares in extent. Farms rent from 115 to 125 francs the hectare, grass lands from 150 to 200 francs the hectare.

The remaining and more extensive portion of these two provinces consists of land of a very different description; it is light and sandy, somewhat analogous to the Landes of Gascony. Being poor in quality, it necessitates large quantities of manure, both natural and artificial, such as sewage, the mud derived from towns, which is carefully collected and sold, lime, guano, pulverized bones, and oilcake. This region exhibits all the peculiarities of Flemish husbandry, being characterized by variety of production, second crops, the employment of very active manures, and the extreme smallness of the farms. These do not exceed on the average 3½ hectares in West Flanders and 2½ hectares in East Flanders; a considerable number are even very much smaller in West Flanders, half of them not exceeding 50 acres or a little over 1 acre, a subdivision no doubt in a great degree to be accounted for by the intense competition for land which exists in this densely populated province. The ratio of population in East and West Flanders is about one inhabitant to

every acre of land. Rents in the two provinces average from 85 francs to 110 francs per hectare. Wages of farm labourers vary from 1 franc 15 centimes to 1 franc 30 centimes a day, and the price of land from 2,500 francs to 5,000 francs per hectare.

The following rotation of crops is frequently adopted in this district:—

1st year, potatoes; 2nd, wheat, followed by turnips; 3rd, flax with clover; 4th, clover; 5th, rice or barley, followed by carrots; 6th, oats and turnips; 7th, buckwheat.

The second agricultural subdivision, the Campine, comprises the greater part of the provinces of Antwerp and Limburg. It is a region of moor and heath, dotted at intervals with villages and cultivated fields, the soil being in general arid and sandy. Considerable efforts have been made of late years to improve this very barren and naturally unproductive district, roads and canals have been constructed, a system of irrigation and drainage has been introduced, and wealthy proprietors have purchased lands and done much to ameliorate their condition. There is one inhabitant to every $1\frac{1}{4}$ hectares, or hardly half the population of Flanders. The average extent of the farms is from 10 to 30 hectares, the price of arable land is about from 2,000 to 3,000 francs per hectare, and rents average from 60 to 75 francs per hectare. Wages are not actually higher than in Flanders, but the condition of the labourers is somewhat more favourable in consequence of the Lande Communale, or common pasturage grounds, which enable them to keep a goat or a cow. The employment of manures is even more necessary and also more carefully attended to in the Campine than it is in Flanders, but the rotation of crops differs materially from that adopted in Flanders, and is in general inferior. The following gives an idea of the system of rotation which prevails in this district:—

1st year, potatoes; 2nd, rye, followed by spurry; 3rd, rye; 4th, oats and clover; 5th, clover; 6th, rye and spurry or buckwheat.

The third subdivision, the Hesbaye, is formed of the provinces of Brabant and Hainault, and embraces the most fertile lands of Belgium. The soil consists of clay and sand mixed, and is eminently adapted to the production of wheat.

Until recently the system of triennial rotation of crops, allowing the land to lie fallow every third year, prevailed generally amongst the Walloon population of the Hesbaye, but this practice has been replaced by a succession of the most varied crops, among which wheat occupied a prominent place. The culture of beetroot is much attended to in these provinces. Arable lands are worth from 4,000 francs to 6,000 francs per hectare. Rentals average from 100 francs to 110 francs per hectare, and in some localities even reach from 125 francs to 150 francs per hectare. It is stated that the value of land in this region has nearly doubled in thirty years, an increase no doubt to be attributed to the extreme development attained by the industrial and mining interests of this district. Labourers' wages average about 2 francs per day,

The fourth leading subdivision, the Condroz, occupies a large portion of the provinces of Liege and Namur. This region contains the largest farms in Belgium, and is probably the most backward in respect of farming, skill, and industry. The principal crop consists neither of wheat nor of rye, but of spelt, a cereal which appears to be more hardy than wheat, and which produces a more palatable flour for domestic use than rye. In Flanders it is estimated that probably not one individual landlord in four, farms his own property, whereas in the district of Condroz the land is about equally divided between proprietors and tenants. The population is less dense than in most other parts of Belgium, the average number of inhabitants being in the proportion of one to every $2\frac{1}{2}$ hectares. The price of the hectare varies from 1,600 francs to 4,000 francs, and rents from 45 francs to 100 francs per hectare. The rotation of crops is generally triennial in this district, viz.:—

1st year, a cereal; 2nd, oats; 3rd, fallow-fields.

Artificial grass is seldom produced, and second crops are almost unknown. This system of rotation, the "assolement triennal," though as a rule condemned by the best authorities, is not without its advantages in districts such as the Condroz, where the hard and heavy character of the soil requires a great deal of labour to be expended upon ploughing. The fallows produce weeds or grass, which contribute to feed sheep or other cattle, thus furnishing manure for the use of the farm.

The fifth sub-division, the Ardenne, consists of the greater part of the province of Luxemburg. The climate is very rigorous, and the productive power of the land falls far below the average of the remainder of Belgium. After having produced three crops in succession, the land remains uncultivated for six or seven years, or even longer. Oats form the staple product of the district, the population does not exceed the rate of one inhabitant to every 3 hectares, and the price of arable land does not average over 1,000 francs per hectare, nor rents exceed 40 francs per hectare. The labouring population, however, enjoys great advantages, the necessaries of life being very cheap, while the rate of wages attains the average of 2 francs per day.

The principal farm implements employed in Belgium are light ploughs drawn by horses or oxen, harrows of ordinary construction, rollers, threshing machines, scarifiers, &c. The spade is much employed, especially in Flanders, Artificial manures are, as have been seen, very much used in the sandy districts of Flanders and the Campine, but less so on the more fertile soil of Brabant and Hainault.

But little cattle is raised for sale in Belgium. A few animals are bred in the Campine and rather more in the province of Luxemburg, but in the other provinces farmers only raise enough for the use of their farm, and frequently purchase cows in calf, three-fourths of which come from Holland. Cattle are sometimes fatted on pasture-land, but the greater part are fattened by the distillers, who generally import their oxen from Germany. Belgium does not furnish sufficient cattle for its own consumption, consequently, considerable quantities of fat cattle are imported from Holland and Germany : the former being preferred. Calves are separated from the mother from their birth ; seven-eights of the calves are fattened upon milk for a period of from ten to twelve weeks, and one-eighth is retained on the farm. On small properties cattle is in a great measure stall-fed, by which means a large quantity of manure is obtained and carefully preserved. The period of stabling is from November to May, but in some parts of Flanders and of the province of Antwerp the cattle are stall-fed during the whole year. In the polders, cattle is pastured in the meadows and in clover-fields during the day, always returning to the stable at night. But animals that are being fattened for the market are allowed to remain in the fields night and day. The number of horned cattle in Belgium in 1856 amounted to 1,257,649, being an increase of 53,758, or 4·46 per cent. upon the number officially returned in 1846.

The number of sheep at the same period was 583,485, or 79,023 (nearly 12 per cent.) less than in 1846.

The total amount of land under cultivation in Belgium in 1856 amounted to 1,830,515 hectares, of which quantity 1,518,018 were devoted to tillage, and 312,498 hectares were employed as grass lands. The following statement shows the extent of land devoted to each particular branch of agriculture :—

	Hectares.
Cereals	947,578
Vegetables	58,285
"Plantes industrielles" (hops, chicory, &c)	76,993
Roots and green crops	335,762
Grass lands	312,498
Fallow fields	64,418
Kitchen gardens	34,981
Total	1,830,515

Taking the whole of Belgium into consideration, 12·39 per cent. of all cultivated lands produce second crops, while in the provinces of Antwerp and East Flanders the estimate reaches from 20 to 48 per cent. of all arable lands.

The average production of wheat and rye per hectare is stated to be as follows :—

	Wheat.	Rye.
	Hectolitres.	Hectolitres.
In Antwerp	17·83	18·25
Brabant	16·45	16·64
West Flanders	20 14	21·23
East Flanders	20·10	21 64
Hainault	19·67	20·25
Liege	17·04	17 83
Limburg	17·15	15 39
Luxemburg	14·74	19·37
Namur	15·90	16 42
The whole Kingdom	18·41	18 68

Woods and forests, according to the census of 1846, occupied an extent of 485,666 hectares, and are thus sub-divided :—

	Hectares.
Woods belonging to the State	34,810
Woods belonging to communes (townships and parishes) and public establishments*.	133,894
Woods belonging to private individuals	317,162

It is difficult to appreciate the annual produce of woods and forests in Belgium, but the nearest estimate fixes it at about 2,034,940 stères,† and the revenue derived from them according to the land survey ("cadastre"), is probably 19 francs 33 centimes per hectare,

* Exclusive of woods of less extent than 5 hectares, and young plantations.

† The stère, or cubic mètre, is equal to 35·174 cubic feet English.

making in all, inclusive of the crop of mast, deadwood, game, &c., an annual revenue of 16,998,310 francs.

The management of woods and forests in Belgium is no longer, as in former times, under the control of a special Department, but forms a branch of the Administration de l'Enrégistrement et des Domaines, and as such is placed under the direction of the Minister of Finance. A Council, of which the Minister is the President, besides various inspectors, regulate all that concerns the supervision and care of the public woods and forests. The Régime Forestier is governed by a variety of laws and regulations, the basis of which, as far as the management is concerned, is the well-known old French Ordonnance of 1669, relative to the Eaux et Forêts, modified by the laws of 1790 and 1791, but the French system of "aménagement," under which the number of trees to be cut annually, was regulated by law, has never been applied to Belgium. According to the prevailing usage the State and Communal Authorities are advised in this respect by the local inspectors, who are not themselves subject to any fixed rule or principle, and private individuals are governed by whatever they consider to be most advantageous to their own interests. The preservation of woods and forests was in former times guarded by very severe and stringent regulations, but these were abolished as far as woods and plantations belonging to private individuals were concerned by the law of 15th and 20th September, 1791. An attempt was, however, made in the year 1803 to restrict the alienation or destruction of woods belonging to private persons, by a law which was to remain in vigour for twenty-five years, but the main principles of which were indefinitely prolonged by an Arrêté-Loi dated the 14th of March, 1814.

Notwithstanding this last-mentioned Arrêté-Loi, the Belgian Government has, it appears, acted upon the assumption that all legal restrictions applying to individual proprietors ceased at the expiration of the twenty-five years, stipulated under the law of 1803. Some legal authorities, however, do not share this opinion, and hold that isolated woods and plantations cannot be alienated or destroyed without the sanction of the Minister of Finance. (See Articles Bois, Aménagement, and Défrichement, in the work entitled "Répertoire de l'Administration et du Droit Administratif en Belgique," by MM. C. de Brouckère and F. Tielemans.)

8. With the exception of the steam-threshing machine, which is now extensively used, machinery is not much employed as a substitute for, or in aid of, manual labour in Belgium. As a rule, the use of steam ploughs, mowing and reaping machines, &c., entails too much expense, nor are they indeed suitable to small farms. Threshing machines are generally purchased by associations of farmers, who club together for the purpose, and after having been successively employed by each of the subscribers, are frequently let out on hire to others, whose means do not enable them to contribute to the purchase, or to obtain one themselves.

The average daily wages of agricultural labourers in Belgium, according to the Report published by the Minister of the Interior in 1862, were as follows:—

	Per Day.	
	Men.	Women.
	Fr. c.	Fr. c.
For labourers who live with their employers (farm servants) ..	0 78	0 45
For labourers who do not live with their employers (day labourers) .	1 36	0 86

These wages do not, however, represent the entire compensation received for their labour, extra pay being given for harvesting and for threshing, the latter often assuming the shape of an allowance in kind at a much higher rate of remuneration than the ordinary daily wages. According to a statistical return to be found in the Minister's Report above cited, there were 15·04 agricultural labourers to every 100 male inhabitants in the rural districts; and as regards women, the proportion was 7·03 to every 100 inhabitants of the female sex. The number of farm servants employed in Belgium, according to the census of 1846, was as follows:—107,303 men, and 69,723 women, being in the proportion of about 155 men to 100 women.

9. There is but little if any emigration amongst the agricultural labourers of Belgium.

10. Properties being generally very much subdivided, it frequently happens that the owners of land do not live on their own properties, but inhabit towns or villages adjacent thereto. In some parts of the country, especially in Flanders, small proprietors are not generally in the habit of farming their own land, and as it is considered more profitable to suppress the expenses attendant upon keeping buildings in repair, it is becoming very much the custom to remove the farmhouses existing on small properties. This practice, however,

only prevails in the neighbourhood of towns or villages. In the polders but few properties have farm houses erected upon them, and the proprietor or tenant farmer inhabits some neighbouring village or hamlet.

11. Small proprietors, who farm their own land, occupy in general well-constructed houses, and are comfortably clad. The food of the majority of this class of persons, as well as that of tenant-farmers, is, however, exceedingly plain, consisting chiefly of bread made from wheat, rye, or spelt according to the locality, buttermilk and potatoes. The only animal food they employ, as a rule, in the Flemish provinces, is bacon; but the inhabitants of the Walloon provinces consume a greater proportion of meat. Beer is rarely drunk, the principal beverage being coffee mixed with chicory.

12. The urban population, according to the last census, amounted to 1,323,090; the rural, to 3,661,261 souls; the latter being in the proportion of 2·76 to 1, as compared with the former. The total superficial measurement of lands in Belgium, according to the census of 1846, being 2,603,036 hectares, and the number of proprietors amounting to 33,586, it follows that the average population of proprietors was at that time 1 to about 8 hectares, or 18 acres, but this estimate includes all lands, whether cultivated or uncultivated.

13. Opinions differ as regards the effect of the extreme subdivision of land viewed in reference to agriculture, but, practically, the state of the law and the usages resulting from it seem to be generally acquiesced in and approved of.

(B.)—Tenants and Sub-Tenants under Landlords.

Tenure.

1. The number of tenants in Belgium, according to the Report published by the Minister of the Interior in 1850, was 234,964, of which number 145,967, or about 60 per cent., held land not exceeding half an hectare, or about $1\frac{1}{8}$ acre in extent; 66,027 persons, about 30 per cent., held from 1 to 5 hectares, or $2\frac{1}{4}$ to $12\frac{1}{2}$ acres; and those holding over 5 hectares amounted to 22,970, or about 10 per cent.

2. Farms are generally held upon lease, but not invariably so. The usage regarding leases varies in the different provinces or districts, but the use of long leases does not appear to extend to Belgium. In some parts of the country, including the Province of Antwerp, I am informed that the practice of letting farms without leases, or tenancy-at-will, is, if anything, on the increase. This system is preferred by most landlords, who, in consequence of the great competition for farms in thickly populated districts, find no difficulty in procuring tenants on these terms. As a rule, however, three years' leases are most commonly granted. Some proprietors do not give leases, simply because the tenants, having full confidence in their landlords, do not require a written covenant.

The agricultural class in the Flemish provinces have, moreover, a great dislike to sign any document; but did they require it, leases would of course be granted. There is a great distinction to be made between estates held by the noblesse, in the occupancy of which tenants have succeeded each other from father to son for perhaps a century, and lands recently purchased by persons in trade, or who have otherwise acquired wealth, and between whom and their tenants relations of equal intimacy cannot be expected to exist. In the latter case, leases are generally given, and the highest amount of rent exacted, whereas in the former an amicable understanding usually prevails between landlord and tenant, the tenant almost invariably meeting with liberal treatment at the hands of the proprietor.

According to law (Code Civil, Article 1717) a tenant has a right to underlet or assign his lease to a subtenant unless the contrary is specified in the lease, a restriction, however, almost invariably stipulated by the landlord. It therefore rarely occurs that land is underlet in the sense implied by the French word "souslouer," that of yielding or assigning a lease to another person; but the practice of letting small patches of land to farm labourers, with the tacit consent of the proprietor, is very common. In some parts of the country it would be almost impossible to procure labourers unless on the condition of allowing them a small piece of land to cultivate for their own use and that of their families. As these labourers are often, it appears, bad paymasters, a high rent is usually expected from them in order to cover the risk of loss. It does not appear to be usual in Belgium to grant allotments to labourers free of rent.

3. Tenancy may be created either by parol or written agreement (Code Civil, Article 1714). Tenants holding lands without a written agreement are supposed by law to possess a claim to occupancy until the land has yielded its full natural produce. Thus the

occupant of a field or an orchard, which produces its crop within the twelvemonth, is entitled to hold the same for the space of one year; but the holder of arable lands, subject to a succession of crops ("soles ou saisons") is not liable to be disturbed until the full rotation of crops, according to the custom of the country, has been produced (Code Civil, Article 1774).

It must be observed that the practical operation of this law being made to depend upon the custom of the country, renders it liable to be variously interpreted. Thus it seems that in those localities where the old system of rotation, terminating after a certain number of years by a year of fallow-fields ("jachères") has been abandoned, the law is considered by some as being inoperative. But it may be said that a landlord evicting a tenant against the provisions of this law, incurs as a rule the risk of a lawsuit. In reality, however, tenants are rarely molested or evicted from their holdings, except on account of non-payment of rent. All unwritten agreements cease to possess any binding force at the expiration of the periods specified in the foregoing Article.

4. A written agreement may be registered, but registration in Belgium ("l'enrégistrement") is purely fiscal in its character, and confers no legal validity on a document. In case of a written contract it has, however, the effect of establishing its date, or what is called in law a "date certaine."

5. No law or custom exists in Belgium whereunder a tenant is considered as having a right to remain in occupation of his holding as long as he pays a stipulated rent, or a rent to be determined from time to time by a legal tribunal, or by agreement subject to arbitration. At the expiration of a written lease, the tenant loses all right to hold the land, even without receiving formal notice to quit; nevertheless, should he remain and be left in undisturbed possession by the proprietor, he acquires *ipso facto* by law the rights of a tenant holding without a written agreement, as specified in answer to question 3 (Code Civil, Article 1776). See also "Dalloz Jurisprudence du 19éme Siècle," vol. xix.)

6. A tenant may sublet, as before stated, or sell his interest in his farm, unless prohibited from so doing by a stipulation to that effect in his lease.

Rent.

1. Rent is always chiefly paid in money, though some leases stipulate certain additional payments in kind, such as butter, lard, ham, pigs, eggs, poultry, straw, hay, &c. This practice is, however, gradually falling into disuse, and the payment of rent is generally paid in cash, the landlord purchasing from his own tenant whatever produce he may be in need of.

2. Most questions connected with the occupation of land are regulated by the Code Civil. The law requires that the amount of rent payable should always be stipulated in the covenant between the parties, otherwise the lease loses its validity. Properties are valued by the Government Land Surveyors ("Inspecteurs du Cadastre"); and the amount of rent demanded depends no doubt generally upon the estimated value of the land, and the extent of its productiveness.

Lands belonging to charitable institutions, on account of public interests being concerned, are habitually let to the highest bidder; but this is the only case in which rent is strictly speaking governed by competition. In another sense, competition no doubt exerts an influence upon rents, inasmuch as in densely-peopled districts where a great demand for land exiss, rents are apt to rise in proportion. The periods at which rents are payable differ considerably according to localities. In the province of Antwerp leases generally commence either on the 15th of March, the 1st of October, or the 25th of December, and the rent is payable annually. There exists no custom in Belgium which corresponds with what is termed in Ireland a running or hanging gale.

3. As long as the lease lasts the proprietor is bound to adhere to its conditions, and the rent remains the same. If the tenant does not pay his rent, or otherwise fails to fulfil his engagements, the landlord has in some cases the right to terminate the lease, which confers upon him the power of raising the rent if he thinks proper to do so. In other cases he may commence an action against the tenant in order to compel the latter to comply with certain obligations, the non-fulfilment of which does not annul the contract.

4. The respective rights of proprietors and tenants for the recovery of rents and other claims are regulated by the Code Civil, the "Loi sur le Régime Hyphthécaire," and the "Code de Procédure Civile." In case of failure on either side the other party has his remedy by an action of law. The law confers some exceptional privileges upon the landlord over other creditors. In case of non-payment of rent the landlord may, in preference to any other creditor, seize the produce of the crops for the year, as well as the furniture and farming utensils belonging to the tenant to the extent of three years back rent, and

even on account of rent which has not yet fallen due. In the case last mentioned, the other creditors have the right of re-letting the house or farm for the remainder of the lease, and to make their profit out of leases or rents, on condition, however, of paying to the proprietor any balance still due to him. The proprietor possesses further the right of seizing the furniture belonging to the house or farm if they have been removed without his consent. He may also arrest the proceeds of the crop or the farming implements of the tenant, in order to cover any advances he may have made him for seeds, or otherwise, on account of the crop, or for the purchase of the utensils.

Evictions.

1. The legal means of procedure by which a landlord evicts a tenant for non-payment of rent or other cause, depends upon the nature of the lease. If the latter is what is termed a "bail authentique," or a lease executed in the presence of a notary, the process is summary, the proprietor simply sending a bailiff to ascertain that the tenant is in default, to inform him that the proprietor intends to cancel the lease, and to give him notice to quit the premises. If he refuses, he may be forcibly ejected. In case the lease is signed privately by the parties ("sous seing privé"), without the intervention of a notary, the eviction of the tenant must be preceded by a judgment from a competent Tribunal. The tenant may appeal, and be allowed a certain time to redeem, according to the circumstances of the case. Where there is no lease it is usual to give six months' notice, and the evicton must also be preceded by a judgment.

2. Evictions, generally on the grounds of non-payment of rent, are by no means infrequent.

Improvements.

1, 2, 3, 4. The general conditions of the Belgian law in relation to this matter are the following:—

The landlord is bound by the nature of his contract, and without the necessity of any special stipulation to that effect, to keep the property he has let in a state fit to be employed for the purpose for which it was hired. The property must be handed over in a good state of repair in all respects, besides which the landlord must do all the repairs that may become necessary to keep the property or buildings in a habitable state, excepting those which specially concern the tenant. The latter consist of minor repairs which, if there is no stipulation to the contrary, are governed by local usage, and are chiefly the following:—keeping fire-places, doors, locks, window-frames, mantel-pieces, &c., in repair, painting and plastering walls to the height of 1 mètre, repairing or restoring pavements, if there are but a few broken, and window-panes, unless destroyed by hail or other extraordinary accident, cleansing wells, cisterns, and water-closets, unless there should be a clause to the contrary; but the tenant is not bound to repair any damage resulting from ordinary wear and tear, age, or other unavoidable circumstances. If the landlord refuses to execute the repairs which fall to his charge, the tenant may enter an action against him, and if the property has become untenable, he may cancel the lease, and sue for damages.

As regards buildings connected with farms, they are generally, but not always, erected by the landlord.

In respect of improvements executed by the tenant without the previous consent of the landlord, should they not be strictly necessary, or such as appertain by law to the landlord or to the tenant himself, consisting, for example, of new buildings or plantations, the proprietor has the option at the expiration of the lease either of requiring the tenant to remove the same and restore the property to its original condition, at his own expense, and without any compensation, and even to force the tenant to pay damages for any injury which may have accrued to the property by reason thereof (Civil Code, Article 555), or he may retain the improvements. In the latter case the tenant is entitled to an indemnity, but only to the extent of the cost, and not the actual value of the improvements of whatever nature they may be. If the landlord's consent has been previously obtained, the tenant may claim to be reimbursed the cost of any buildings he may have erected. For what are termed ordinary improvements, such as placing grates, closets, shelves, or anything attached to walls, or in the nature of fixtures, the tenant is not entitled to compensation. On properties where no farm-houses or buildings exist, such, for example, as grass lands about to be converted into arable lands, on which it may be considered desirable to erect a house or other buildings, the latter are not infrequently executed by the tenant on the condition of his receiving compensation for the same at the expiration of the lease either from the proprietor or the incoming tenant. In such cases

it is a principle of law that the indemnity to be granted to the tenant is based not on the actual value of the buildings in connection with the remainder of the property, but upon the cost of construction and the state and condition of the buildings at the termination of the lease. In case of improvements effected by tenants holding long building leases, such as those termed "contrats d'emphytéose ou de superficie," which constitute what is known in England as "leasehold property," all improvements and repairs, including the construction or reconstruction of buildings, must, of course, be executed by the leaseholder and not by the owner of the land. According to custom, which, however, varies in each province, tenants on giving up their farms are entitled to certain proportions of the crops already sown and other advantages from the incoming farmer. This, what is termed in the Flemish language "Pachtersregt" (tenant-right) or "Derdevoor," and is a matter to which considerable importance is attached. In principle the "Pachtersregt" appears to be to a certain extent based upon law (Code Civil, Article 1777), but in its practice and details it is entirely governed by custom.

The following outline gives an idea of the leading usages with reference to the rights of outgoing tenants which prevail in different parts of the country. In the Province of Antwerp the outgoing farmer is allowed to remain in the enjoyment of two-thirds of all arable lands until the harvest season, without paying any rent for the same. In some localities the crops, as well as the manure expended upon the land, are valued by experts, and the old tenant receives from his successor compensation for his outlay and labour. In Brabant the custom varies according to the nature of the leases. In some localities the farmers have no right to any indemnity for the improvements they have introduced, in others they are entitled to receive the value of the manures, seeds, and price of tillage. In some cases the outgoing tenant is entitled to half the crop, provided the soil has been duly manured, ploughed, and sown during the last year of his occupancy.

In West Flanders the outgoing tenant generally receives an indemnity for the straw and manures left by him on the farm. In East Flanders the rights of tenants are established by a Regulation dated 17th October, 1671, which being, however, founded upon very ancient customs is not in all cases conformable to the laws of property existing in the present day, nor with the actual situation of agriculture in the province, and often gives rise to contestation and difficulty. The outgoing tenant generally receives the value of all seeds sown on the farm. He is entitled, according to valuation, to the coppice or underwood inclosing fields, and frequently to an indemnity for all seeds, manure, and for the tillage of the land. In the Province of Hainault, as a rule, the outgoing tenant receives from his successor the value of the straw on the farm and the manures employed on the soil, but allows the new tenant to sow clover in a portion of his crop. In the Province of Liege, where the leases generally commence from the 15th of March to the 15th of May, the outgoing tenant is generally entitled to the winter crops. In the Pays de Herve, however exceptionally, the tenant receives as a rule no indemnity for his improvements of whatever description they may be. In Limburg the outgoing tenant is entitled to the benefit of all hard grain sown, which generally amounts to two-thirds of the crop. In Luxemburg he receives the value of the seeds of all green crops. In the Canton Wellin the outgoing tenant enjoys special advantages. He is entitled to the crops, and also to the use of the cattle and of all the farm implements, the result of which is that the new tenant is compelled to wait for a year, or even eighteen months, before entering into the enjoyment of any produce or revenue, with the exception of hay and the yield of grass lands. Lastly, in the Province of Namur the crop of cereals belongs to the outgoing tenant, and in some districts the new tenant is bound to cut the crops for him, and to leave the lofts of the farm-house at his disposal during the space of a year. In others the outgoing tenant is entitled to the value of all seeds sown.

According to the Report published by the Minister of the Interior in the year 1862, the Belgian Government was desirous of regulating and reforming in some degree these various and complicated usages, but owing to the difficulties inherent to the question, the idea appears to have been abandoned. Subsoil-drainage, which requires a considerable outlay of money, is generally undertaken by the landlord, the tenant paying a fixed charge of 5 or 6 per cent. in addition to his rent, upon the capital expended.

As far as general improvements of a public character is concerned, extensive works of irrigation have been carried out by the Government, and a considerable extent of unproductive communal lands have been sold and cleared of late years, in virtue of the law of the 25th of March, 1847.

5. There exists at Brussels a bank for the encouragement of agriculture ("Banque Générale pour favoriser l'Agriculture et les Travaux Publics"), but this establishment is not in the habit of making advances to tenants for the improvements of their holdings. The latter generally obtain loans or advances, when needed, through notaries or other private

persons in their own localities, and the Government does not in any way intervene in the matter.

Miscellaneous.

1. The relation between landlord and tenant are in general friendly, although the general increase in the value of land, and consequent gradual rise in the rents, tends to create a certain amount of discontent amongst the tenant-farmers. The relative rights and duties of landlord and tenant are regulated by the Civil Code, but no special legislative interference appears to be required for the better protection of tenants.

2. The mode of cultivation adopted by small proprietors and tenants are substantially the same, nor does any very appreciable difference appear to exist between the two classes in respect of intelligence, character, or position generally. It may, however, be assumed that the small proprietor, being the owner of the soil, and having no rent to pay (admitting his property to be free from incumbrances) will be to that extent better off than the tenant-farmer.

3. The statistical returns published by the Government do not establish the comparative increase in the population of the two classes.

4. Emigration amongst this class is almost unknown.

5. Public opinion has apparently very little to say to these matters, and the people seem in general to be satisfied with the existing state of things.

6, 7, and 8. The creation of freeholds or tenancies by proprietors, and the granting of leases, have never been enforced by the Belgian Legislature.

9. No steps of this nature appear to have been at any time taken by the Belgian Government.

10. No person being liable to be dispossessed of his property, except on the ground of public utility, tenants can only become proprietors of land as opportunities of sale arise, and in proportion to the capital they may have been able to save or realize, or by profiting by such facilities as may be offered by the Banking institutions previously alluded to, the power of obtaining loans on mortgage tending, no doubt, materially to facilitate the acquisition of real property. The desire of possessing land, whether favourable or not to the general interests, is a marked characteristic of the agricultural classes in Belgium, and by the exercise of extreme frugality and thrift, tenants are frequently enabled to become proprietors. Upon this point the Minister of the Interior (Report of 1850) remarks as follows:—"It is worthy of observation," he says, "that in general those provinces in which the cultivators of the soil exhibit the greatest tendency to become proprietors are also those in which agriculture is the least advanced and makes the slowest progress. Without wishing to attach an exaggerated degree of importance to this coincidence, it seems as though one might be entitled to conclude from it that the too easy access to property is not favourable to the development of production, a matter easily to be understood if one reflects that in devoting too large a proportion of their profits to the acquisition of land, farmers are prevented from applying them to the improvement of the soil which they already cultivate. There is no doubt that this tendency is one of the greatest obstacles to improvement in certain parts of our country, and that those of our provinces where, all else being equal, the appropriation of land on the part of the cultivators is of the slowest growth, are also those in which the cultivation of the soil has attained the highest degree of development and perfection."

11. The law of succession tends necessarily to favour the subdivision of landed property in Belgium, and the dispersion of land is also increased by the system which generally prevails at public sales, of dividing real estate into small parcels or lots, a custom which materially interferee with persons inclined to purchase an entire property, but raises the price of land by encouraging competition.

Copyhold.

There are no tenures in Belgium resembling the copyholds of England, in which rent or services have become, or are becoming, fixed by custom, and the tenant irremoveable.

Having endeavoured in the foregoing replies to answer, to the best of my ability, the various questions embraced in the paper of queries which accompanied Lord Clarendon's despatch, I should be glad to be able to illustrate more in detail certain points affecting the tenure of land in this country which may not have been fully examined in the preceding pages.

It may be remarked, that Belgium is essentially a country of small farming, the law

of succession combined with other causes having tended, and continuing to contribute, to the scheme of dispersion and subdivision of land, and it is from this point of view that the whole system of land occupation and husbandry in this country should be examined. The number of persons holding lands being very considerable relatively to the population at large, it necessarily follows that the properties occupied by them are generally small, so small indeed that, according to official returns, the number of farms over 50 hectares, or about 125 acres in extent, are only in the proportion of 75 to every 10,000.

The Belgian land system thus differs widely from that which prevails in most other countries of Europe, although resembling, as regards the smallness of the holdings, but probably in few other respects, the state of things which prevails in some parts of Ireland. The difference between the Belgian and Irish cultivator is, however, as will be seen, very considerable, the former being, in the first place, very frequently the owner of the land he farms, and the system of husbandry pursued in the two countries, differing very materially from each other both as regards theory and practice. The comparative merits and disadvantages of cultivating small holdings and of farming on a large scale, forms a question which admits of controversy, although, in reality, it has been to a certain extent prejudged. The balance of opinion in the prosent day in most European countries, in view of the great changes introduced into agriculture by modern science and skill, is in all probability favourable to culture on a large scale. Yet the example of Belgium gives rise to much matter for reflection, and shows that a dogmatical decision on this point ought not to be too hastily arrived at. If, as is the case in England, farming operations are carried out in a spirit of enterprise, with the expectation of turning capital to a profitable account, there is no doubt that the extent of the farms ought to correspond with the resources and means intended to be applied to their cultivation. But if, on the other hand, as in most parts of Belgium, farming is carried on upon traditional principles, as it were, according to routine, and with restricted means, the very extent of a farm is a bar to the application of a sufficient amount of capital to render it productive. These questions have been examined at considerable length in most of the works which treat of agriculture in Belgium, and M. de Laveleye, one of the latest writers on this subject, whose interesting "Essay on Belgian Agriculture" has been previously alluded to, very frequently compares the two systems, and often in terms favourable to the principle of small farming as practised in this country. He says, with reference to the Condroz, the district of Belgium in which, as before stated, large holdings are the most numerous: "It is thus that, according to the diversity of ideas and habits, farming upon a large scale ("la grande culture"), which in some countries favours agricultural progress, tends in others to retard it. Whenever in the Condroz a farm is divided, the land becomes at once better cultivated, and the number of cattle on the farm increased. The small land-owners, who cultivate properties varying from two to three hectares in extent, never allow their land to lie fallow, their crops are more varied and better regulated, the yield is much more abundant. They produce beet-roots, rapeseed, and turnips; their spelt and oats attain a greater height and produce more grain. Thus, in the actual condition of habits and ideas amongst the rural population, the prevalence of large farms is one of the causes of the inferiority of culture in the Condroz."

In speaking of Flanders, M. de Laveleye expresses an opinion equally favourable to small holdings. He says, with reference to the farms in the Pays de Waes:—"If the cultivators of land understand the proper methods of fertilizing the soil, the subdivision of land, far from diminishing its productive power, will tend considerably to increase it. If they are ignorant of these methods, they will not succeed better, or as well perhaps, on large farms. It does not follow from this, that the subdivision of land is to be held up as an ideal to modern society, for it entails upon man an increase of labour hardly compatible with the development of his intellectual faculties; but in view of the state of things existing in Flanders, it may be asserted, that up to this day it has produced none but advantageous results, at least as far as production and rent are concerned." Another writer, Van Aelbroeck, who, in his valuable work on farming in Flanders, has entered into a very close examination of the system of small holdings, inclined unmistakeably to the same opinion as that expressed by M. de Laveleye. He says, in allusion to the small farmers in those provinces:—"Many of them carry on at the same time the business of weavers, and are considered as amongst the most profitable citizens of the State, seeing that they produce the largest population, encourage trade and commerce, and are the best farmers. They say in Germany, 'Arme boer arme landbouw' (a poor peasant leads to poor husbandry); but in Flanders they say, 'Arme boer met groot gebruik slechte landbouw' (a poor peasant on a large farm leads to bad husbandry). The size of the farm," he says, "must not exceed the means and knowledge of the cultivator; and in this consists the theory and practice of the small Flemish farmers."

The whole argument is in favour of small proprietorship; and he makes the following practical remarks, for the purpose of illustrating the value of this principle. "If," he says, "a small cultivator possesses a bad piece of land, he will endeavour to improve it by constantly digging and turning up the soil; he will even labour for years to overcome its defective qualities, and render it productive; whereas land of a similar quality in the hands of a large proprietor is in general neglected, and will remain uncultivated." After remarking that the more land is subdivided, the more populous it becomes, he says, "If it is true that the land which is the most densely peopled, is the most valuable to the State, it certainly also follows that the small cultivators are the most profitable to both the State and the land." "So convinced are people in Flanders," he further says, of the advantages of small holdings, that large farms are frequently divided and converted into small ones. A part, or all the buildings are removed, and the lands are let to various small agriculturists, who may be inclined to increase their farms. This occurs chiefly in thickly-populated districts. The landlord incurs less outlay for the repair of buildings, and obtains a higher rent for his land." Another practical advantage of the system of small holdings, which results from the extreme subdivision of land in this country, is the facility it affords to a large number of persons, artisans, small traders, and others to purchase or occupy land in the vicinity of towns or villages, by which means they are enabled to produce potatoes and other vegetables for domestic use, and to the great benefit of themselves and their families. The possession of a patch of land, however small, not only contributes to their comfort, but creates a feeling of pride and independence, which reacts favourably upon the character and conduct of the possessor.

Under this system of small proprietorship, as well as of small holdings generally, it is observed by persons who have practically studied the question, that the effect produced upon the land itself, is the following:—

1. It is better manured. Nothing capable of being turned into compost is wasted.

2. It is kept cleaner. The artisan devotes all his leisure time to the cultivation of his small holding; and all spare hours of labour are utilized by the whole family, his wife and children assisting him in weeding, and the lighter occupations connected with the land.

3. It is more productive. When half of one crop is gathered, the other half is already planted or sown. Beet-roots, for example, are often planted between rows of potatoes, the latter being removed by hand as often as they are wanted. Land containing 90 per cent. of silica, it is asserted, may, under this system, be made to produce potatoes, and even rye and other crops, by the continuous application of manures, in a couple of seasons.

It must be said, however, that many agricultors in this country do not approve of the extreme subdivision of land which exists in Belgium, and would prefer to see greater extension given to the system of large holdings, combined with the various appliances of modern scientific culture, which as yet are comparatively but little employed in this country. Cheapness of production, they say, can only be attained by the application of such means, sustained by large capital, or in other words, by the introduction generally of what is termed intensive culture. Such a system is, however, of slow growth, and would necessitate very considerable changes in the conditions under which landed property is at present held in this country. Viewing matters, however, as they now exist, a very competent authority states it as his opinion, that in order to cultivate land on the most approved modern principles, farms ought in no case to fall below a minimum of 20 hectares, or about 45 acres, a limit which is of course exceeded by a considerable number of farms in this country. But, upon inquiring from the same person, whether the system of farming upon a very small scale was prejudicial to public interests, or to the land itself, the reply was, that such was not the case. That small holdings could be made very profitable to their owners, and that the number and variety of crops which are produced from the land under this system, could not be said to be injurious to the soil, provided the latter were sufficiently manured, and in other respects judiciously managed. It would be erroneous, however, no doubt, to suppose, that a system of husbandry, such as that which has just been described as existing in Belgium, could be applied with advantage in all other countries indiscriminately; for in order to meet with success, it must have been developed naturally by the force of circumstances and events, and be, moreover, in harmony with the customs and institutions of the inhabitants, and adapted to the climate and general capabilities of the soil.

The Belgian rural population, especially in the Flemish provinces, appear to combine the leading qualifications requisite to success in the cultivation of small properties. They are steady, sober, and persevering, prudent, and economical in their habits, and are possessed of all necessary experience in whatever relates to the management of land.

They are, moreover, extremely attached to the soil on which they were born and brought up, and are especially devoted to agricultural life; and it is these qualities which have enabled them to attain great success, and a considerable degree of prosperity as small cultivators, in spite of natural disadvantages in respect of soil, except in specially-favoured localities, which it has required the continuous industry of many generations to overcome. Other populations might not be qualified to encounter similar obstacles with equal success.

In order further to elucidate the position of the Flemish cultivators or tenant-farmers, it may be stated that they possess in general the great advantage of entering upon their farms with a fair amount of capital. Hence it follows that they generally own a sufficient number of cattle to produce the requisite amount of manure for the use of the farm, besides most carefully and sedulously collecting and employing all the fertilizing substances which can be applied to the soil for the purpose of sustaining and increasing its productive power. Lastly, the Flemish farmer cultivates his land, as a rule, in an intelligent manner, adopting a rational and advantageous rotation of crops. The condition of the small Irish cultivators offers in many respects, it is to be regretted, a contrast to the foregoing picture. Rarely possessing a sufficient command of money on taking possession of their holdings to commence cultivating them advantageously, and being moreover often ignorant of the methods of culture which are so universally understood and practised in this country, a train of evils follow which render the position of the occupiers of the land one of constant discomfort and difficulty, and underlie a great part of the misery and distress which press so heavily upon the agricultural classes in many parts of Ireland.

The position of the agricultural labourer in Belgium, judging from the average rate of wages paid throughout the country, as stated in my reply to question 8 (Section A), does not appear a favourable one, but it must be remembered that the number of persons so employed is relatively limited in this country, in consequence of the considerable number of small proprietors who farm their own land, and whose families, besides those of the tenant-farmers, are generally employed in agricultural pursuits. In certain localities, taking as an example the Province of East Flanders, where an excess of population brings with it increased rent and diminished wages, the remedy would seem to be in emigration, yet strong local attachments added perhaps in some degree to jealousy of race appear to prevent the Flemish peasant from removing even as far as the neighbouring Walloon Province of Hainault, where the want of agricultural labourers forms a source of complaint, and is looked upon as a serious inconvenience.

It has already been stated that the use of long leases is by no means general in Belgium, neither is there a positive law securing to tenants compensation for their improvements at the termination of their lease.

According to the custom of the country, however, as has been seen, tenants are allowed certain advantages upon quitting their farms which constitute to limited extent an indemnity for the outlay expended by them as respects seeds, manures and tillage. The amount of compensation, however, to which they thus become entitled, is not only very variable in its character, but does not make up for the absence of a lease sufficiently long to enable an enterprising tenant to realize a fair profit upon the improvements he may have effected. It is true that buildings are generally executed by the landlord, the relations between the proprietor and his tenant very much resembling in some respects that which exists under the métayer system of Lombardy, the landlord paying the taxes and repairing the buildings, and the tenant providing cattle, implements, and seeds. But such improvements as drainage, irrigation, marling and subsoiling, will not repay a tenant unless he is secured by a long lease, besides a legal claim to compensation for his improvements upon quitting his farm. This question was examined at considerable length at several meetings of the Conseil Supérieur d'Agriculture in the year 1867, during the discussions which arose with reference to lands belonging to charitable and other public institutions, which are by law assimilated to those held by minors, and thus cannot be leased for a period exceeding nine years.* A very general desire was manifested to obtain such a modification of the law on this question as would enable lands of this description to be leased for terms of from twelve to fifteen years, a relaxation which has since, in fact, been practically accorded by the "Deputations permanentes", though the law remains unchanged; and independently of the special object in view, opinions highly favourable to long leases and fixed indemnities to tenants were expressed at these meetings, as well as by some of the local agricultural commissions.

I am inclined, however, to doubt whether the landed proprietors of Belgium are in general disposed to favour the adoption of these ideas, although in the uncleared portions

* See "Code Civil," Article 1712, and Arrêtés of 19th July, 1816, and 15th July, 1829.

of the Campine and the Ardenne, for example, where, in order to develop the capabilit ie of the soil, irrigation, drainage, and other artificial improvements involving a considerable outlay of capital are indispensable, it would seem beyond doubt desirable, in the interest of agriculture as well as in that of proprietors themselves, to adopt the practice of granting long leases as well as a liberal compensation to the tenant for the improvements he may have introduced upon his holding during the period of his occupancy.

No. 14.

Mr. Lumley to the Earl of Clarendon.—(Received February 21.)

My Lord, *Brussels, February 20, 1870.*

WITH reference to my despatch of the 12th instant, I have the honour to inclose the reply of Mr. Consul Grattan to my inquiries why the contract to which he refers in his Report which I forwarded to your Lordship in my despatch No. 32 of the 20th instant, the object of which is to regulate the loan or hire of cattle, or of any animals employed in agriculture or commerce, is so little used in Belgium.

I have, &c.
(Signed) J. SAVILE LUMLEY.

Inclosure in No. 14.

Consul Grattan to Mr. Lumley.

Sir, *Antwerp, February 18, 1870.*

IN reply to the despatch which you did me the honour to address to me on the 12th instant with reference to my recent Report on the loan of cattle, I beg leave to state that, as far as I am able to form an opinion upon the subject, one of the principal reasons why the customs to which I referred are not employed in Belgium is, that they do not appear to be practically very much required. Horned cattle being abundant and not very dear in this country, the Belgian cultivators are generally enabled to supply the cattle wanted for the use of their farms. Should they be in need of an advance of funds on entering upon their holdings, they are usually able to procure a loan through notaries or others, and in some cases, I understand, advances of this description are made by the landlords.

Another reason which may be assigned for the non-employment of the *bail à cheptel*, is that the contract in question, though incorporated in the Code Civil and forming part of the Belgian Law, does not seem to be very much known or understood.

It would appear, however, that during the Middle Ages a custom which bore more or less analogy to it existed in Belgium. I infer at least as much from the following passage in M. Emile de Laveleye's work on Belgian agriculture. Alluding to the landed property held by the church in the Campine during the eleventh and twelfth centuries, he says :—

"De puissantes abbayes établies dans la contrée étendirent de proche en proche les défrichements autour d'elles. Celles d'Averbode, de Postel, de Tongerloo, les prieurés de Korssendouck, de Troon, et d'Achel employèrent sans relâche une partie de leurs revenus à mettre en culture des terres vagues et à planter des forêts, dont plusieurs existent encore. Les religieux faisaient préparer et labourer les terres nouvelles pendant quelques années, et quand ils les avaient portées à un degré suffisant de fertilité, ils y bâtissaient des fermes, qu'ils confiaient avec le cheptel à des métayers."

I have, &c.
(Signed) G. A. GRATTAN.

No. 15.

Sir C. Murray to the Earl of Clarendon.—(Received December 15.)

My Lord, *Lisbon, December 10, 1869.*

I HAVE the honour to inclose herewith, to your Lordship, copy of a despatch which I have received from Mr. Consul Brackenbury, forwarding a report upon the various systems of Land Tenures prevailing in Portugal, in accordance with the instructions contained in your Lordship's despatch to Mr. Doria of the 11th of October.

I have, &c.

(Signed) CH. A. MURRAY.

Inclosure 1 in No. 15.

Consul Brackenbury to Sir C. Murray.

Sir, *Lisbon, December 4, 1869.*

WITH reference to Mr. Doria's despatch of the 18th October last, I have the honour to transmit to you, herewith, a report upon the various systems of land tenure prevailing in Portugal.

In this Report I have endeavoured to answer to the best of my ability the several queries contained in Lord Clarendon's despatch, marked Circular, of the 26th of August last, and to furnish such general information upon the subject as falls within the scope of the instructions of the circular itself.

In now submitting, as I respectfully beg to do, the result of my inquires to your better judgment, I need not point out to you, Sir, familiar as the fact must be to you, how much the satisfactory execution of a task like this is embarrassed by the absolute want in this country of any official agricultural statistics.

I can only hope that the defects in my Report due to this, and to other causes, will not be such as to render it utterly valueless as a very humble contribution towards the solution of the important question of the settlement of land tenure in Ireland which these inquiries are designed to elucidate.

I have, &c.

(Signed) GEORGE BRACKENBURY.

Inclosure 2 in No. 15.

Report upon Land Tenure in Portugal.

Preliminary Note.

AS the value attaching to the information furnished in the ensuing pages must necessarily depend, in great measure, upon the authority of the sources from which that information is derived, I have considered it desirable to preface this Report with a list of the more important works which I have had occasion to use in the execution of my task, and which are as follows :—

"Codigo Civil Portuguez." 2da Edição oficial, Lisboa, 1867.

"Censo de 1864." J. da C. Brandão e Albuquerque. Lisboa, 1866.

"Memorias Economicas da Academia Real das Sciencias." Vol v. Lisboa, 1815.

"Relatorio acerca da Arborisação Geral do Paiz." Lisboa, 1868.

"Compendio de Economia Rural." L. A. Rebello da Silva (at present Portuguese Minister of Marine). Lisboa, 1868.

"Compendio de Economia Industrial." L. A. Rebello da Silva. Lisboa, 1868.

"Relatorios do Governo da Companhia Geral do Credito Predial Portuguez." Exercicio de 1868. Lisboa, 1869.

"Memoria sobre a Origem e Progressos da Emphyteuse." V. A. E. de Carvalho. Lisboa, 1814.

I append a Table showing the English equivalents of the Portuguese money weights and measures referred to in this Report :—

MONEY.

		£	s.	d.
1 real	equal	0	0	0·53
100 reis	„	0	0	5⅓
1 milreis (1,000 reis)	„	0	4	5⅓
4½ „ (4,500 reis)	„	1	0	0

SUPERFICIAL MEASURES,

1 hectare	2·471 acres.

DRY MEASURES OF CAPACITY.

1 hectolitre	2·751 bushels.
1 moio (or 60 alqueires)	2·70 imp. quarters.

WEIGHTS.

1 gramme	0·035 ounces avoirdupois.
1 kilogramme	2·206 pounds avoirdupois.

Name of Country.—PORTUGAL. The continent of Portugal, exclusive of the adjacent islands and the colonies, according to the last census, that, viz., of 1864, contains,—

Population.—A population of 3,986,558 inhabitants; a number supposed, by competent judges, to be below, rather than above the mark. Of these 1,955,929 are males, and 2,030,629 females.

Area and Agricultural Produce.—The area of Portugal is 8,954,010* hectares, or 34,573½ square miles, and the density of population is therefore 115⅓ to the square mile. For facility of calculation in the following Report the population will be taken in round numbers as 4,000,000, distributed over a surface of 9,000,000 hectares, and the mean density or population therefore is 44 per 100 hectares.† Of the total area of 9,000,000 hectares it has been calculated by two eminent authorities at least,‡ and on entirely independent data, that 2,000,000§ hectares, at the outside, are under any species of cultivation. Of these, 1,048,000 hectares, or rather more than half, are laid down in cereals, with an average annual yield of 11,050,000 hectolitres. The subjoined Table, which will be found useful for subsequent reference, shows the proportion of the different grain crops to each other and to the total yield, the number of hectares devoted to each, the mean value per hectolitre, and the gross value of each description of grain, and of the whole production.

Description.	Hectolitre.	Hectares.	Value per Hectolitre.	Gross Value.
			Reis.	Milreis.
Wheat	2,000,000	250,500	3,623	7,246,000
Indian Corn	5,600,000	311,500	2,318	12,980 800
Barley	700,000	70,000	1,739	1,217,300
Rye	2,400,000	400,000	1,452	3,484,800
Oats	200,000	12,000	1,452	290,400
Rice	150,000	4,000	2,500	375,000
	11.050,000	1,048,000	..	25,594,300

The remaining area under cultivation is thus distributed:—

	Hectares.
Fallows	300,000
Vegetables	31,499
Potatoes	13,499
Orchards‖ and kitchen gardens	24,424
Meadows and pasture lands	200,000
Oliveyards	42,000
Vineyards	189,409
Chestnut woods	12,436
Woods and forests	100,000
	913,265

From the foregoing Tables it will be seen that the staple cereal in Portugal is Indian corn, and this, with olives and vines, form together the *differentia*, if I may be allowed the expression, of Portuguese agricultural production. Other cereals are indeed grown with more or less success; more than a tenth of the cultivated area is devoted to pasturage; a very large amount of vegetables is raised with incredible care and patience from the com-

* According to the calculations of the Geographical Institute of Lisbon, as quoted by M. Rebello da Silva. The Report of Messrs. C. Ribeiro and J. Delago to the Portuguese Government ("Arborisação Geral do Pais") gives the area as 8,962,531 hectares.

† This gives 114 approximately to the square mile, a result near enough to the truth for practical use.

‡ M. Rebello da Silva and Messrs. Ribeiro and Delgado.

§ Accurately, 1,961,265 hectares.

‖ Including orange and lemon groves, which occupy 2,546 hectares.

paratively small area devoted to this species of culture; the quantity of oranges, lemons, and other fruits produced is considerable, and, owing to the varieties of soil, climate, configuration, and exposure enjoyed by this country, almost every agricultural product of Europe is to be found here in more or less abundance; but in any calculation of the present resources of the land the main elements must be the three above enumerated. A significant circumstance which will not have failed to be observed is, that 300,000 hectares, or about one-sixth of the whole cultivated area, are annually absorbed by fallows. The extent and value of the grain crops has already been given; the mean value of the wine crop has been estimated at 36,000,000 milreis (8,000,000*l.* sterling); that of the olive crop at 2,228,000 milreis; other fruits and all vegetables, including potatoes, at 7,967,000 milreis.

Omitting the particulars of other items of less interest, the normal annual value of the vegetable produce of Portugal is estimated by M. Rebello da Silva at 81,101,300 milreis (18,022,510*l*), while the same authority gives the corresponding value of the animal products at 23,221,000 milreis (5,160,222*l.*), thus making the annual total value of the agricultural produce 23,182,732*l.*; an amount which is certainly very much under-estimated.

Religions.—The Catholic Apostolic Roman religion is the only religion recognized by the State, and is professed by the vast majority of the nation. All other forms of worship are tolerated under certain restrictions. Of Dissenters, the only sects of any importance are the Jews and Protestants. Of the former there are perhaps 200 in Portugal, of the latter the number, exclusive of foreigners, resident or domiciled, is not appreciable.

Industrial Pursuits.—The population of Portugal being, as above stated, 3,986,558 persons, it is calculated, upon what appear to be reasonable data, that the rural population absorbs 2,899,090 of these, among whom are found—

Proprietors (including "foreiros")	419,402
Tenant farmers	139,000
Domestic and farm servants, shepherds, cowherds, &c.	105,000
Hired labourers	210,000
	873,402

Which, admitting that each of them supports a fraction more than two persons on an average besides himself, makes up the above total. There would then remain 1,087,467 persons of both sexes to be accounted for in the urban population, and thus the rural would be to the urban population nearly as 3 to 1.

Of the urban population, according to calculations which must be regarded as only approximately correct, owing to the absence of any official data posterior to the year 1852, there would be employed of both sexes and of all ages in—

Manufactories on a large scale ("Grande Industrie")*	19,076
Manufactories on a small scale, professions, handicrafts, &c. ("Pefite Industrie")	186,684
Mining	4,541
Fisheries	20,000
Commerce and wholesale trade	5,942
Retail and mixed, *i.e.*, wholesale and retail trade establishments	23,591

The foregoing data as to the urban population are so imperfect that they must only be accepted with great reserve. Bearing in mind, however, that they leave large classes of the inhabitants of towns unspecified, as well as the majority of the adult female population, besides all infants and many minors of both sexes; and that, with regard to retail and mixed trades, the number of the establishments alone is given, without any reference to the number of persons employed in them, I see no reason to believe that the respective totals have been to any serious extent over-stated. The number of 19,076 operatives employed in the Grande Industrie is obtained by M. Rebello da Silva, from whose work on Industrial Economy the above data are extracted, by adding a fifth as the probable rate of increase since 1852, when their number was stated in an official Report drawn up for the Department of Public Works at 15,897, employed in 362 factories. Of these operatives more than 11,000, or two-thirds, were at that time employed in the great cities of Lisbon and Oporto alone. The total number was divided among men, women, and children (of both sexes) under 16 years old, as follows:—

Adult men	7,978
„ women	4,772
Boys and girls	3,147
	15,897

* In this division are comprised all establishments employing ten or more workpeople.

In the different branches of manufacture the numbers employed were in operatives—

Cotton textures	4,130	Wool spinning	166
Woollen ditto	3,083	Other descriptions	98
Silk ditto	589	Tobacco manufactures*	1,325
Linen ditto	383	Dyeing and printing	1,190
Mixed silk and cotton textures	58	Paper making	1,071
Mixed wool and cotton ditto	23	Glass and crockery-ware making	905
Silk spinning	23	Hat making	657
Cotton ditto	54		

At the same time (in 1852) there were only in the whole of Continental Portugal 70 machines, with an aggregate of 983-horse power. M. Rebello da Silva estimates them now at 84, by the same process of adding one-fifth to the number ascertained at the earlier period.

Passing now to the Petite Industrie, we find 115 small† factories of cotton, linen, and wool; 411 small iron foundries; 21 small laboratories of chemical products; and 219 small dyers' yards. To the purely manufacturing population thus obtained must be added a few thousand hand-loom weavers, and 1,500 women and girls employed in lace-making. The rest of this industrial division consists mainly of artizans, handicraftsmen, butchers, bakers, carriers, &c., and persons employed, directly or indirectly, in the learned professions, literature, and the fine arts.

It is thus evident that not only is the bulk of the population of Portugal devoted to agricultural pursuits, but that of manufactures on a large scale she is almost totally estit ute.

Land Occupation.

The system of land occupation in Portugal is fourfold, viz., by—

(*a.*) Small proprietors;
(*b.*) Tenants under proprietors;
(*c.*) Métayers;
(*d.*) Emphyteutas.‡

These last are occupiers by a tenure analogous in many respects to the copyhold of England, the rent being fixed, and the tenant irremovable; and they are by most Portuguese writers referred to the class of small proprietors.

As to the proportion in which these several systems exist in this country nothing can be known with absolute certainty, and but little with any probably degree of certainty at all. Before endeavouring to ascertain this residuum, it will be necessary to premise that these modes of tenure vary more or less directly with certain broad geographical divisions of the country which have been adopted by most of the writers on rural economy.

These agricultural regions are the Northern, Central, Southern, and Mountainous.

1. The Northern Region embraces the six administrative districts of Vianna do Castello, Braga, Oporto, Aveiro, Vizen, and Coimbra,§ and contains 1,892,836 hectares, with a population of 1,853,397 inhabitants, which gives nearly 100 inhabitants per 100 hectares. This is the most thickly populated part of Portugal, and here small proprietors abound, and the "petite culture" prevails. It is stated that in parts of the district of Vianna the large properties are to the small as 1 to 15, in other parts as 1 to 10, while the number of small proprietors nearly equals that of the day labourers. The configuration of this region is generally mountainous, and the natural fertility of the plains and valleys is augmented by irrigation or by alluvial deposits from the rivers. The cereal chiefly cultivated is Indian corn. Cattle-breeding is on the increase, and the system of stall-feeding has been introduced of late years in this region, which now carries on a steadily progressive export trade in live cattle. In this region also is comprised the famous wine-growing district of the Douro.

2. The Central Region extends from the valley of the Mondego to the south of the valley of the Tagus, and comprises the three administrative districts of Leiria, Santarem, and Lisbon.‖ Its general aspect is not indicative of fertility, and with an area of 1,770,394 hectares, it has only 836,555 inhabitants, or 47 inhabitants per 100 hectares. Although containing much poor and worthless land, many of the valleys, and the great basin of the Tagus receiving, as it does, the rich deposit of the river, show great fertility.

* At that time (1852) a Government monopoly.
† "Small," *i.e.*, employing fewer than ten operatives.
‡ A full account of this species of tenure will be found under the answer to the query headed "Copyhold."
§ Minho:—Vianna, Braga, Oporto. Part of Beira:—Aveiro, Vizen, Coimbra.
‖ Estremadura:—Leiria, Santarem, Lisbon.

The defective conservancy of the river, and the consequent flooding of good land at the period of freshes, undo, however, much that labour accomplished. The land at such times is covered with sand, or remains under water, and it is said that there is no district of the country where marshes and fens are more numerous than here. In this region large and medium sized properties prevail almost equally, and small properties and "la petite culture" are, therefore, rare. Owing to its central position wheat, the southern crop, and Indian corn, the prevailing crop of the north, are cultivated in about equal proportions, while the rice crops exceed those of all the rest of the Kingdom. Of live stock the production is comparatively small.

3. The Southern Region comprises the two Provinces of Alemtejo and Algarve, in other words nearly the whole of Portugal south of the Tagus, and is coincident with the administrative districts of Beja, Evora, Faro, and Portalegre.* In area it is the most extensive, in population the thinnest, of the four agricultural regions, containing only 527,790 inhabitants to the 2,979,574 hectares which it embraces, or only 17 inhabitants to the 100 hectares. The soil is for the most part thin, poor, and sandy, though interspersed occasionally with lands of a heavier and more fertile character. The climate is the hottest and driest in Portugal, and woods of cork-trees and oak abound. The Kingdom of Algarve, one of the greatest sub-divisions of this region, and of which the flora appears to be transitional between those of the Mediterranean and of the Oceanic coasts of Europe, is characterized by the growth of the dwarf palm- and carob-tree, &c. Here large properties predominate, which M. Rebello da Silva compares to the *latifundia* of the Romans. Wheat is the principal cereal, and large numbers of swine are fattened in the vast acorn-woods for which the district is remarkable.

4. The mountainous region consists of the four administrative districts of Castello Branco, Guarda, Bragança, and Villa Real.† It occupies an area of 2,311,206 hectares, with a population of 768,916 inhabitants, which makes the density of population 33 inhabitants to the 100 hectares. This region, as its name indicates, is the highest elevation of the four, being formed of lands placed at a height of from 500 to 2,000 metres above the sea level. The highest lands produce a coarse undergrowth; the slopes of the mountains and the lower table-lands afford good spring pasturage and rye crops; while the lands at the base of the mountains and in the bottoms of the valleys form luxuriant meadows, and yield crops of wheat and good Indian corn wherever the plains are sheltered, and in a position to profit by the alluvial deposit from the rivers. In this, as in the northern region, the "petite culture" is in the ascendant, and small and, perhaps, medium sized properties are the rule. The mountain-tops, which are barren, are mostly common lands. Rye is the cereal chiefly cultivated here, and sheep and goats are the principal live stock.

The subjoined Table exhibits, in a synoptical form, some of the more important data above stated in regard to the four agricultural regions of Portugal, together with some other particulars which may serve to elucidate the difficult and doubtful question as to the proportion in which the different systems of land occupations exist throughout the country.

* Including *Emphyteutas*.

(A.)—Small Proprietors.

1. The total want of any official statistics in regard to land tenure in Portugal renders it impossible to give an approximate calculation of the quantity of land usually held by each small proprietor. The holdings, however, must be mostly of very limited extent, since the proportion of proprietors to the total cultivated surface of Portugal is such as to give only about 4½ hectares (about 11 acres) of cultivated land as the share of each proprietor. Allowing for the large properties which are the rule in Southern Portugal, and for the large and medium sized estates, which occur more or less frequently in the other agricultural regions; it is obvious that there must be a very large number of proprietors whose portions of land will be extremely small. These properties are perhaps more usually intersected by others than held together.

2. The law regulating the descent and division of landed property on the death of the owner is as follows:—

(*a.*) Where the owner dies intestate, or where, having made a will, the will is annulled or becomes void, the estates descends to his lawful heirs, in the following order:—

1. Lineal descendants.
2. Lineal ancestors.
3. Brothers and sisters and their issue.
4. Surviving husband or wife.
5. Collaterals not included in No. 3 to the tenth degree.
6. The State.

Relatives in the same degree take equal shares of the inheritance, without respect of sexes; and a relative in a nearer degree excludes a relative in a more remote degree.

(*b.*) Where the owner dies having made a will, and leaving lineal descendants or lineal ancestors, two-thirds of the estate descend absolutely to his lawful heirs, as the whole would have done if he had died intestate, and in the same order; as does also such portion of the remaining third as may not have been disposed of by will by the owner, in accordance with his legal right so to dispose of this third.

(*c.*) Where the owner is married, and the marriage has been entered into without a settlement, the law gives one-half of the estate to the survivor of the marriage for life, and the other half goes to the lawful heirs; and husband and wife have each the power of disposing by will of one-third of their real property. But on the death of the survivor, the children or other lawful heirs are absolutely entitled to take *per capita* or *per stirpes*, as the case may be, the other two-thirds which they take in equal shares.

It is obvious how much this law encourages the division of landed property. When the inheritance falls in, the coheirs may make whatever arrangement they please as to the mode of dividing it, provided they are none of them absent or outlawed, and are all of full age; and provided also such arrangement be embodied in a public instrument. Where, however, any of the co-heirs are minors, absent or outlawed, and inventory and valuation must be made in due form of law, and the heirs are then called together to a private auction, at which they settle on what terms each of them is to retain such particular tenement as he may select. Where, owing to differences of opinion among the heirs, being of full age, or from its being necessary to guaranty the interests of such of them as are minors, it becomes impossible to decide upon the proper price of any given lot, such lot is put up to public auction, and the proceeds are divided among the heirs. All the lots remaining, after the amicable distribution or public sale, are then divided equally among the heirs, in accordance with the legal valuation.

Finally, where there remains any object which has not been adjudged at auction, and which is incapable of division, it may be sold, or allotted to one of the heirs at a price to be agreed upon,—or it may be held in common by them all.

The legal method used for the sale, transfer, exchange or division of landed property is by registry. All transmissions of real property or rights are by law subject to registration. The failure to register them does not prevent the titles being pleaded in suits between the parties or their representatives, but such titles, until registered, have no effect as against third persons; and possession, unless previously registered, cannot be pleaded in proof of ownership. The mere act of registering a transmissive title, without any other formality, transfers the legal possession to the person in whose favour such title is registered. Contracts for the sale, transfer or exchange of landed property must always be reduced to writing. The instrument may be of a private nature, where the value does not exceed 50 milreis (about 11*l.*); where the value is more than that amount, the contract must be executed in due form before a Notary Public.

The mode of division of landed property in due course of law, as between co-heirs, has been set forth in the answer to the preceeding query.

It has been seen that all transmissions of landed property must be registered to hav any effect against third persons; and that sales, transfers and exchanges of such property must be effected by a distinct conveyance—executed in most cases before a Notary Public. The expense of such conveyances is moderate, while the fees for registration are within the means of the most humble.

4. Special facilities for raising loans upon all landed property, whether in large or small parcels, are afforded by a public company sanctioned by and enjoying special privileges from Government, under the provisions of the Law of 13th July, 1860, which enacts that any Land Credit Company, or Land Mortgage Bank, to be thereafter constituted, shall, upon the fulfilment of certain preliminary conditions, enjoy, during twenty-five years from the date of its official constitution, the exclusive privilege of issuing mortgage bonds or debentures, which shall represent solely and exclusively the transactions of the companies in loans upon mortgages of real property.

A company was accordingly constituted under the provisions of the law above cited, under the title of the "Companhia Geral do Credito Predical Portuguez," the statutes of which were approved by the State on the 25th October 1864. A liberal interpretation by Government of the 13th Article of the Law of 13th July, 1863, has, besides, recently (2nd March, 1868) exempted loans contracted with this Company from the "decima de juros," an impolitic tax of 10 per cent., first imposed in 1762 and still levied upon the accruing interest of all other loans. The "Companhia Geral do Credito Predial Portuguez" commenced its operations at the end of the year 1865, and the sub-joined Table shows their amount for that and each subsequent year to 1868 inclusive.

Year.	Loans to Landowners.				Loans to Municipalities.			
	Number of Loans.	6 per cent.	Number of Loans.	5 per cent.	Number of Loans.	6 per cent.	Total.	
							Number of Loans.	Milreis.
		Milreis.		Milreis.		Milreis.		
1865 ..	1	3,996	..	..	..	..	1	3,996
1866 ..	235	856,548	..	..	..	..	235	856,548
1867 ..	568	2,130,570	16	135,648	3	12,996	587	2,279,214
1868 ..	803	1,808,082	1	144	3	12,978	807	1,821,204
	1,607	4,799,196	17	135,792	6	25,974	1,630	4,960,962

Thus, up to the end of 1868, loans on the security of real property had been made by the company to the amount of 4,934,988 milreis or 1,096,664*l.*; the saleable value of the properties mortgaged amounting to 12,664,533 milreis or 2,814,340*l.* The annuities in which the principal and interest of the above 1630 loans are to be paid off are distributed as follows:—

Number of Loans.	Number of Annuities.	Total Amount of Loans.
		Milreis.
60	10	95,742
2	12	7,020
1	14	1,512
15	15	40,338
2	16	954
108	20	487,134
14	25	85,986
1	26	702
126	30	264,438
5	31	9,234
3	32	3,996
2	35	5,490
64	40	146,070
22	50	84,726
1,205	60	3,727,620
1,630	..	4,960,962

The sums for which such loans were affected are thus classified :—

					No. of Loans.	Total Amount.
	£		£			Milreis.
From	20	to	110	.. .. ..	447	29,148
	110		220	.. .. ..	352	54,928
	220		440	.. .. ..	341	103,663
	440		1,100	.. .. ..	272	188,316
	1,100		2,200	.. .. ..	115	169,544
	2,200		4,400	.. .. ..	68	205,488
	4,400		8,800	.. .. ..	27	161,892
	8,800		15,500	.. .. ..	5	64,452
	15,500		31,000	.. .. ..	3	75,556
	31,000		44,500	.. .. ..	1	44,444
	Total			.. .. ..	1,630	1 102,436

It will be seen from the last three Tables—

First, that these loans are already commonly raised ; secondly, that by far the largest portion of them, whether as regards number or amount, were raised at 6 per cent. interest, and were repayable by annuities extending over sixty years ; and thirdly, that three-fourths of the number of loans were contracted for sums under 450*l.*, and that one-half of the total value was raised in sums ranging from 20*l.* to 2,300*l.* It is reasonable, therefore, to suppose that a considerable proportion of the money lent by the Company has been taken up by the smaller proprietors ; and it will be remembered that the system may be said to be still in its infancy. The terms and conditions upon which these loans are effected are—that the sum borrowed shall be furnished to the borrower in mortgage bonds at par, bearing the same interest as the loan, the Company undertaking to negotiate the bonds and to make advances upon them ; or, where the borrower prefers it, the loan may be made in money ; that the long annuities by which the principal and interest are to be repaid shall never extend over a period of less than ten, nor more than sixty years, and shall be payable in two equal half-yearly instalments ; that such annuities shall comprise—

1. Interest which shall never exceed 6 per cent on the capital lent.

2. A sinking fund, to be determined by the rate of interest and the duration of the loan.

3. A commission for expenses of management, which shall never exceed 1 per cent. per annum.

That interest at the same rate as that on the loan shall accrue on the over-due half-yearly payments, and that default of payment of the annuities shall also entitle the Company to claim immediate payment in full of the debt within thirty days from notice given, and, failing payment, to foreclose in due form of law ; that the borrower shall have the option of making his payments partially or wholly in advance, and in money or mortgage bonds, which shall be received at par ; but such payments in advance shall entitle the Company to receive an indemnity of 3 per cent. on their amount ; and, finally, that such loans shall only be made on first mortgage, except when contracted for the purpose of paying all prior charges, in which case the Company will retain a portion of the loan sufficient for this purpose, so as to become, in fact, the first mortgagee.

In practice, these loans scarcely ever bear less than 7 per cent. interest, independently of the sinking fund, a rate which will appear high in English eyes, but which is not excessive as compared with the ordinary interest of money and the average price of the Portuguese funds. There is, nevertheless, an opinion current in the country that the charge will be heavier than many of the impoverished estates will bear in the long run ; that the Company will consequently be compelled in these cases to foreclose ; and that considerable quantities of land will, by this means, be brought into the market, a result which, if it arises, will be analogous in many respects to the operation of the Encumbered Estates Act in Ireland. This result is rendered the less improbable by the fact that while the ostensible object for which the loans are raised is the improvement of the property, they are frequently entered into to relieve the owner from pecuniary embarrassments arising from other causes.

There is no doubt that many of these properties were heavily mortgaged before the Land Credit Company commenced its operations ; and that they still are so. In the ten years from 1852 to 1861, both inclusive, the registered debt owing by the land in Portugal on mortgage amounted to 7,850,000*l.* in round numbers. Of this sum about one-fifth only had been lent by the religious corporations, who charged a fixed interest of 5 per cent. The remaining four-fifths were loans from private persons, and, in the majority of cases, it

is certain the rate of interest was extremely usurious, averaging from 10 to 15 per cent., and even higher. The rate of interest charged by the Land Credit Company has been already given.

6. The legal method of registering these mortgages is by entering them, with the required legal formalities, in the Public Land Register. The Civil Code provides that there shall be a public registrar in each "concelho" (sub-district) of the Kingdom; it prescribes the number and forms of the several registers, one of which is to be a register of mortgages, and provides carefully for the service of registration being executed with all possible despatch. The fees for registration are extremely moderate, each formality costing only a few pence, and the only other expense connected with the act of registration is where it may be necessary to obtain an authenticated copy of the original deed of mortgage from the notary before whom it may have been executed, and even in this case the cost is not heavy.

7. In answer to the question, what crops are raised on small properties in Portugal, it may with safety be replied that, among cereals, Indian corn predominates. The proportion it bears to that of all other corn crops throughout the country, as will appear on reference to the Table gived at the beginning of this Report, under the head of "Area," is one-half in respect to quantity and value, and one-third in respect to the portion of the cultivated area devoted to cereals. The subjoined Table shows in what proportion it is raised in the four agricultural regions, which are arranged in an order corresponding to the prevalence of small properties within the same districts:—

Region.	Order of Prevalence of Small Properties.	Quantity of Indian Corn Grown.
		Moios.
Northern	1	375,552
Mountainous	2	32,098
Central..	3	77,012
Southern	4	6,428

The total produce of the vineyards of Portugal is more valuable even than that of the whole area under corn crops. The following Table, drawn up on the same principle as the last, gives the distribution of the wine crops for the year 1862:—

Region.	Order of Prevalence of Small Properties.	Crops of 1862.
		Hectolitres.
Northern	1	317,751
Mountainous	2	267,850
Central..	3	165,592
Southern	4	88,351

Of the olive crop, nearly two-thirds are produced in the southern and central regions, to which this species of culture is more congenial than it is to the rougher climate of the northern and mountainous regions. The proper rotation of crops, though inculcated in theory, is only beginning to be recognized as a practical necessity of agriculture in Portugal. Hence the large amount of land lying fallow is calculated at not less than 300,000 hectares annually; an extent equal to one-sixth of the whole cultivated area, and to one-third of the area under cereals. In Estramadura and Algarve (central and southern agricultural regions) the most ordinary rotation is a year's wheat or barley, and two years' Indian corn or potatoes. The general mode of cultivation throughout Portugal is extremely primitive; exhaustive predominate over restorative crops, and the agricultural implements are, for the most part, rude and antiquated.

Neither my own experience, nor any data with which I am acquainted, enable me to answer the question "In what manner are stock raised and pastured on small properties, and what is the proportion between tillage and grass lands?" The extent of grass lands must, however, be comparatively small, since their proportion to that of the whole area under cultivation is only as 1 in 10.

8. Machinery is scarcely, if at all, employed either as a substitute for, or in aid of, manual labour.

The total number of hired labourers throughout Portugal (exclusive of bailiffs, farm-servants, cow-herds, &c.) is calculated by M. Rebello da Silva at 210,000, or one labourer to every two proprietors. This gives only 0·105 hired labourers to the hectare, or 0·0424 to the acre. Female labour is extensively employed in the northern and mountainous

regions, where the population is dense and property extremely sub-divided; less in the central region, and scarcely if at all in the southern. Statistics on this point are all but absolutely deficient; but the following is stated to be the proportion of female to male labour in three of the administrative districts:—

Agricultural region.	District.	Hired Labourers	Male.	Female.
Central	Leiria	13,931	10,410	3,521
Northern	Coimbra	18.000	15,814	2,186
Ditto	Aveiro	17.246	8.499.	8.747

The average daily wages of the agricultural labourer throughout Portugal are not obtainable from any published statistics with which I am acquainted. In the Lisbon district, reapers in 1866 were paid from 1*s.* 4*d.* to 1*s.* 6*d.* a-day, and spade labourers from 1*s.* 1*d.* to 1*s.* 2*d.*, or a little more; women and boys from 7*d.* to 10*d.*

In the district of Vizen (northern region) the wages of the men varied from 10*d.* to 1*s.* 3*d.*, while those of the women did not exceed 5*d.* On the whole, I am inclined to believe that the last-mentioned sums would nearly represent the average wages of hired labourers, male and female, throughout the country. Hired labourers on small properties do not as a rule live with their employers, they being themselves in many instances small proprietors also.

9. There is a considerable emigration of these agricultural labourers from the Northern provinces (1) to Brazil, and (2) to the Southern provinces. The extent of the emigration is not accurately known; it amounts, however, to several thousands annually, and its cause is attributable to over-population in relation to cultivated area, to the low rate of wages, and to the desire to make money to invest in land. The capital applied to the land in the Minho is mainly derived from the fortunes made by emigrants to Brazil, while the high rates of wages at harvest time in the thinly-populated South draws a large annual influx of Northern labourers, similar to that of the Irish reapers, who, a few years ago, were to be found in so many of the English counties at the corresponding period of the year.

10. There are no data for ascertaining in what proportion the small proprietors who live on their properties are to those who inhabit villages adjacent thereto. It may perhaps be assumed, though with much caution, that their numbers are about equal.

11. The standard of living and general circumstances of the rural population at large are thus described by M. Rebello da Silva:—

"The rural populations of Portugal are for the most part far more robust, and in many localities thay are *ailing*, weak, and apathetic. The want of sufficient nutriment and the marshy miasmas to which they are exposed contribute to the gradual degeneration they exhibit. Their vigour and growth are stunted by the large quantities of vegetable food (such as broad and French beans, peas, chick-peas, &c.) which they are compelled to consume in order to obtain the *quantum* of nitrogenous substance essential to life. Potherbs, a little rice, chestnuts, and scanty rations of fish, constitute, with the vegetables, the main sustenance of our rural classes. Beef, mutton, goats'-flesh, and pork are never eaten by them, except perhaps on a few holidays in the course of the year. The people live and labour—or it may be more correctly said that in many parts of the country they only vegetate,—and are too weak and too little energetic for the physical efforts demanded of them."

Gloomy as this picture is, I fear it is but little exaggerated, and its main details are certainly more applicable to the class of very small proprietors than to the hired labourers, who, in the Alemtejo at least, obtain, besides their wages, a scale of rations, into which meat enters to a considerable extent.

12. No answer can be given to this question with any approach to accuracy, owing to the lamentable deficiency of agricultural statistics—a deficiency which is thus characterized by the writer of the latest work of authority upon this subject:—

"Only a direct census of the agricultural population could enable us to meet these difficulties; but so far are we at present from anything of the kind, that there does not exist even the expectation of a time when so important a subject may begin to be cared for."

13. The prevalent public opinion as to the advantages or disadvantages of the system of small proprietors in this country would appear to be that where, as is frequently the case in the north of Portugal, the subdivision of the land has been carried to excess, the result has been to lower the standard of living of the rural population, and to create an intense competition for land, which, while it stimulates the avarice of the people in acquiring it, leaves them an easy prey to usurers after it has been acquired. On the other

land, it is held that this system here, as elsewhere, under favourable circumstances, conduces to a more careful cultivation of the soil and to a larger production from it, and that encourages among the peasant proprietors and their families the virtues of industry, temperance, and frugality. The objections to the system might be easily overcome, if a well-considered scheme were at once adopted for bringing under cultivation the many millions of acres of land which now lie needlessly barren; while its advantages would, by the same process, be intensified and spread over a larger surface; and, as this system of tenure is especially in harmony with the highly democratic form of government which Portugal now enjoys under a constitutional monarch, and is moreover encouraged by the nature of the laws regulating the descent, division, and transmission of land, there can be little doubt that it will eventually be the predominant form of land occupation throughout Portugal.

(B.)—Tenants and Sub-Tenants under Landlords.

The Civil Code of Portugal, which came into operation on the 22nd March, 1868, lays down, with extreme clearness and precision, the law which is to regulate henceforth the conditions and incidents of the different varieties of land tenure; and the information furnished under this and the two following heads (C and D), of my Report, has been mainly derived from the provisions of that code, and has been, in all instances, checked by them, in so far as they were applicable.

The queries under the head B (tenants and sub-tenants under landlords), will be assumed as being repeated the heads C (métayers), and D (emphyteutas), and will be answered separately in regard to each of the three descriptions of tenure, except in as far as the answers to the queries under head B, apply equally to the queries under heads C and D; in which case a reference only will be made to the answer already given under head B.

Tenure.

1. The quantity of land held by each tenant, varies from province to province, from district to district, and from one part to another part of the same district. There are no statistics whatever published upon this point; and it is impossible to give even an approximate calculation of an average.

2. The nature of this tenure is thus defined by the Civil Code;—"The contract of "arrendamento" (letting at a rent, or on lease) arises whenever any one transfers to another the use and fruition of (real property) for a fixed time, and in return for a fixed retribution."

The duration of leases in Portugal is for the most part brief. The vast majority of them are in the nature of tenancies-at-will, from year to year. A five or six years' lease is in practice a long one; and leases of still longer duration are exceptional. It is easier to obtain a lease, for a term of years, of corn or pasture lands, than of vineyards, olive-yards, or orange-groves, since a dishonest tenant will have more temptation and greater facilities to exhaust the latter than the former during the period of his tenure.

A system of perpetual leases was introduced in the Alemtejo in the latter half of the eighteenth century. They were devised as a means of colonizing the waste lands of that province; and their leading incidents were, that the landlord could neither evict the tenant nor raise the rent except by Royal licence, or where the landlord wished to cultivate the farm himself. These laws, which had already become obsolete in practice, have been abrogated by the Civil Code. In effect they were a complete failure; the landlord had always the power of harassing the tenant, who, in his turn, uncertain as he was of the duration of his tenure, mostly exhausted the soil; and at the end of a century's experience of this system, the cultivation of the Alemtejo, if it had not retrogaded, had certainly not made a step in advance. The leading incidents of the tenure are as follows:—

(*a.*) The landlord is bound to deliver to the tenant the farm, buildings, &c., in proper condition, having regard to the use for which they are designed; to preserve the farm in the same condition during the lease; not to disturb the tenant in his enjoyment of the lease, except for the purpose of indispensable repairs, (and even in this case the tenant may claim an indemnity for the interruption of his use of the farm); to secure the use of the farm against disturbance, arising from the rights (though not from disturbance arising from the acts) of third persons; and to answer for the loss the tenant may sustain in consequence of secret defects in the farm, existing prior to the lease. But the landlord may evict the tenant before the termination of the lease, if the tenant does not pay the rent at the periods stipulated, or if the tenant makes use of the farm for a purpose different from that to which it is properly adapted, or from that for which it was let.

(*b.*) The tenant is bound to pay the rent at the time, and in the manner agreed upon; or, where there is no agreement, according to the custom of the district; to answer for damages to the tenement caused by his own or by his dependents' fault or negligence; to use the tenement solely for the purpose agreed upon, or for such purposes as are conformable to the nature of the tenement; to defend the landlord against the usurpations of third persons; and to give up the tenement at the end of the lease, free from deterioration, except such as is inherent in its ordinary use.

(*c.*) If the landlord, upon a requisition being made by the tenant, should not execute in the tenement the repairs necessary to the use for which the tenement is destined, the tenant may rescind the contract and claim damages, or he may have the repairs executed at the cost of the landlord, the latter having been previously cited to answer within a fixed period.

3. In practice the tenancy is invariably created by written agreement. Where there is no lease, or where the lease does not specify the duration of the tenancy, the law declares that the tenancy shall endure for the period customary in the district, and should any doubt arise, from want of uniformity, as to what the custom is, the law presumes the custom to be that the duration shall never be less than the time necessary for one sowing and harvest, whatever may be the crops raised on the tenement.

4. Leases for a period exceeding one year, where the rent is paid in advance, or for a period exceeding four years where the rent is not paid in advance, must be registered. The nature of the system of registration is the same as that for the sale, &c., of land, and has already been fully explained in the answer to query (A) 3.

5. There is no law or custom under which a tenant, holding by any ordinary lease, is considered to have a right to remain in occupation of his holding (after the expiration of the lease) so long as he punctually pays the stipulated or any other rent. But the Civil Code provides that if, on the expiration of the lease, the tenant should be allowed to continue in the unopposed enjoyment of the tenement, it shall be presumed that the contract has been renewed for one year.

6. The tenant cannot sell his interest in his farm, but, if in the contract there is no clause prohibitive of sub-letting, he may sublet at his pleasure; but he will nevertheless remain responsible to the landlord for the rent and for the other obligations derived from the lease.

Rent.

1. In case of ordinary tenancies for a limited term the payment to the proprietors may be made by a fixed amount, either in money or kind. In practice the payment is usually made in money.

2. The rent, in the case of this description of tenure, is regulated by competition. The rent is usually payable yearly, and there is no hanging gale.

3. The landlord (as already stated, see B, Tenure, 2) has an unlimited power of eviction in case of non-payment of rent or breach of covenant; but not so, it may be inferred from the silence of the Civil Code, as to raising the rent in such case.

4. The legal means and procedure by which the respective rights of proprietors and tenants for recovery of rents and other claims are enforced is by action before the ordinary tribunals of the country. The law confers an exceptional privilege upon the landlord over other creditors in regard to the rent for the last and current year; but in order that this privilege may be enjoyed the lease must have been duly registered.

Evictions.

1. The legal means of procedure by which a landlord evicts a tenant are by summary process. A notice to quit having been served in due form of law, if the tenant resist he is summoned before a magistrate, and on the case (as non-payment of rent or expiration of the term) being proved against him, he is evicted by the executive arm.

The only legal mode of resisting such eviction on the part of the tenant is to prove to the Magistrate before whom he is summoned his right to undisturbed possession. The tenant who retains possession wrongfully is liable for damages. In case of eviction for non-payment of rent, the tenant is not allowed any time to redeem, except by the voluntary indulgence of the landlord.

2. Such evictions are not very frequent. When they do occur, the causes are generally non-payment of rent, wilful neglect or deterioration of the holding, and opposition to the landlord at elections.

Improvements.

1. Improvements are executed (if at all) by the tenant. It has been seen that the landlord is bound to deliver the tenement to the tenant in proper condition as regards the use to which it is destined, and to keep it in repair. This provision of law, therefore, applies to buildings existing on the farm at the time of the lease. New buildings erected during the lease would be made by the tenant, in the absence of a special clause binding the landlord to erect them; and few landlords in Portugal would consent to the insertion of such a clause.

2. The tenant has a legal right to execute necessary repairs at the cost of the landlord, if the latter fails to execute them when required to do so. The tenant also, where the lease is for less than twenty years, can, at its expiration, claim from the landlord the value of agricultural improvements, whether necessary or useful, even where they have not been made with express consent, unless, indeed, there should have been a stipulation to the contrary. But in case of a renewal of the lease, the sum thus paid for improvements, and the interest upon it, will be compensated by a corresponding augmentation of the rent. On the other hand, the tenant cannot refuse to give up the tenement at the expiration of the tenancy, unless he has executed improvements expressly consented to in writing, or such as come under the head of necessary repairs.

3. The landlord has, upon resuming possession, a legal right to the improvements made upon the farm by the tenant under the conditions and restrictions stated in the answer to the preceding query, which also explains what right the law recognizes in the tenant.

4. This right (of the tenant) is defined by the Civil Code; it would, I presume, be ascertained by evidence taken in a civil suit, and certainly enforced by the competent Tribunals of the country.

5. Tenants have at present no means of raising loans from Government, or from companies or banks aided or chartered by Government. An admirable law passed through the Cortes in the session of 1867, authorizing the establishment throughout the country of a number of local agricultural banks. As a means to this end certain hospitals and other benevolent institutions, whose property is to be securalized (disamortized) under the provisions of a former statute, were empowered, while still retaining their pious and benevolent character, to apply their liberated capital to the formation of banks of agricultural and industrial credit. One of the chief functions of these banks would have been to make loans for the maintenance and improvement of farms, and for the purchase of machinery, farming implements, manure, &c. This most useful piece of legislation has unfortunately been repealed, to the regret of all the most enlightened advocates of agricultural progress; but there can be little doubt that it will ere long be re-enacted, even if in a somewhat modified shape.

Miscellaneous.

1. The character of the relations between landlord and tenant in Portugal are described by M. Rebello da Silva as being anything but friendly. After referring in terms of unqualified praise to the Scotch system, which he considers due to the moderation and good sense of the landlords, who understand the future advantage to be derived from the equitable treatment of their tenants, he adds: "This obvious truth is unfortunately ignored or contemned in Portugal. Here the landlord and tenant regard and treat each other almost as if they were declared enemies. The contract which binds them together is tacitly adjusted to the prejudice of both, for the landlord thinks that his sole interest lies in the elevation of the rent; while the tenant, careless of the ills arising from the exhaustion of the soil, wrings from it the maximum produce with a view to satiating his own insane greed, and the still insane avarice of the landlord." This picture, undoubtedly most faithful in its striking touches, must be corrected by the admission that the state of hostility here described is latent rather than declared, and that the evils it pourtrays are so ingrained in the habits and traditions of the people that they are scarcely consciously perceived, and rarely complained of. If legislative interference is required for the better protection of the tenant, it is certainly not demanded by him; agrarian discontent, if it exists in Portugal, slumbers, and agrarian crime is unknown. Improvement, therefore, to come at all, must spring rather from a wider spread of education and enlightenment as regards both the classes interested, than from sweeping legislative changes which neither of them desire, and in which only one could be expected to acquiesce.

The mode of cultivation by these tenants is by oxen, for the plough, and by men and women with the hoe, spade, and other agricultural implements. As regards cultivation of their farms and general independence of character, they are, as might be expected, inferior

to the small proprietors; as regards employment of labour, mode, and standard of living, and, perhaps, solvency, they are superior.

3. The annual rate of increase in the population among tenants, as compared with that of small proprietors, could only be ascertained from statistics which unfortunately do not exist.

4. There is but little emigration among these tenants or their children. The chief emigration from Portugal is from the northern provinces, where the principal occupiers of land are small proprietors, "métayers, or emphyteutas" ("foreiros").

5. Public opinion in Portugal as regards the advantages or disadvantages of any system of land tenure has yet to be created. The system most generally prevailing in any particular province would probably be regarded in that province as the best suited to its special circumstances and requirements; and it is probably with a view to consult this localized opinion that the authors of the civil code, whilst simplifying and regulating the different systems of tenure now existing, have made no attempt to reduce them to uniformity.

6, 7, 8. The creation of freeholds or tenancies by proprietors, or the granting of leases, has never been enforced by the Legislature, with the exception of the perpetual tenancies already referred to, which were created in the Alemtejo, and which had become obsolete, even before they were legally abolished.

9. No steps have been taken by Government to create or increase the number of owners or freeholders, and no system is now in force with this object.

10. Tenants receive no assistance by law, public credit, or otherwise, in their endeavours to become proprietors of their own holdings or of their farms. Such endeavours are not frequent; nor, as far can be ascertained, is the desire to make them frequent.

11. The laws in force tend directly to favour the dispersion of land. Entails, which in Portugal were of the strictest and most exclusive character, and which had tied up in bands of iron landed property to the value of at least 3,000,000*l.* sterling, were absolutely abolished by the law of the 19th of May, 1863. The restoration of 1834 brought into the market a large quantity of real property belonging to the religious houses, and the subsequent mortmain laws passed in 1861 and 1862 have set free another considerable extent of land, which will all eventually be sold by public auction. At the same time, the law regulating the descent and division of landed property at the death of the owner, as set forth at the commencement of this report, the law facilitating and in some cases enforcing the registration of transactions in land, and the perfect liberty of selling and buying land which now exists, render its subdivision on an extended scale, a mere question of time, so long as no new legislative action is taken to check or alter the causes at present at work.

(C.)—Metayers.

Tenure.

1. See (B), Tenure, 1.

2, 3, 4, 5, 6. The tenure of metayage ("parceria agricola") is thus defined by the Civil Code.

"Metayage is whenever any person gives to another a farm to be cultivated by the latter on payment to the former of a share of the produce, such share to be ascertained in such manner as the parties may agree upon between themselves."

The usual duration of the tenure is from year to year. Its leading incidents are as follows:—

If either of the parties should die during the existence of the contracts, neither the surviving party nor the heirs of the deceased are bound to carry out its provisions. But, where at the time of the landlord's death the tenant has ploughed the land, dressed the vines, or done any other agricultural work, the contract will subsist for the length of time necessary for the tenant to recoup himself his expenses, unless the heir choose to reimburse him. The tenant must not remove the grain from the threshing-floor, nor the wine from the press, nor garner any other produce without notice to the landlord or his agent, if in the parish. If neither of them be in the parish the tenant may have the produce measured before two disinterested witnesses. Failing to act thus, the tenant is liable to pay double the quota due from him. Where there is no stipulation to the contrary, the seed is taken from the tenant's share of the produce. The tenant who fails to cultivate the farm or who does not cultivate it in the form agreed upon, or, at least, in the customary form, is liable in damages. Where there are no special regulations to the

contrary, the rules of law in regard to ordinary tenancies are applicable to metayage. See (B), Tenure 3, 4, 5, 6.

Rent.

1. In case of tenancies by metayage the payment to the proprietor is by share of the produce.

The rent is regulated by custom. Métayage prevails chiefly in the Minho, and in part of Beira and Tras-os-Montes.

2. The prevailing custom is that the landlord provides the stock and agricultural implements, and receives, usually in kind, although occasionally in money, from one-half to two-thirds of the produce, according to the degree of fertility possessed by the land. The custom of the district, where it is not contrary to the terms of the agreement, is recognized by law.

3, 4. See (B), Rent 3, 4.

Evictions.

1, 2. See (B), Evictions, 1, 2.

Improvements.

1 to 5. See (B), Improvements, 1 to 5.

Miscellaneous.

1. See (B), Miscellaneous, 1.

2. The mode of cultivation by métayers is the same as that adopted by ordinary tenants. They are in every respect (except, perhaps, in mode and standard of living) inferior to the small proprietors.

3. See (B), Miscellaneous, 3.

4. The information given in answer to query (A) 9, applies to métayers as well as to small proprietors.

5. The métayer system has met with no more mercy from Portuguese political economists than it has received, according to Mr. John Stuart Mill, from English authorities. "The métayers," says M. Rebello da Silva, "without capital and without education, farm the land according to traditional usage, and never improve their methods, for the métayer of to-day is exactly what his ancestors were 100 or 200 years ago. These poor and ignorant cultivators, incapable of initiative or of progress, are far, indeed, removed from the degree of civilization attained by the Scotch tenant farmer." In another passage he says:—"In the present day métayage reigns only where the poverty of the rural classes is greatest and most extensive. Impotent, as a rule, to stimulate the improvement of the soil, it is almost always accompanied by agricultural backwardness, and not seldom followed by immorality. The métayer is frequently guilty of fraud in the division of the produce, a circumstance which forces the landlord to continuous vigilance, which in the end becomes oppressive and vexatious." The same authority, however, holds that this system is applicable with advantage to the culture of the vine, the olive, and the orange, where the constant presence and supervision of the landlord is very desirable.

6 to 11. See (B), Miscellaneous, 6 to 11.

(D.)—Emphyteutas.

Tenure.

1. See (B), Tenure 1.

2. This tenure, it has been already observed, resembles the copyholds of England in that the rent is fixed and the tenant irremovable. The rent and services which, by ancient custom, were varying and onerous, were reduced by law in 1832 to a fixed rent, accompanied by a fine on sales, and the fine, as will appear hereafter, has been prohibited as to future contracts.

Emphyteuse* is thus defined by the Civil Code:—"The contract of emphyteuse arises whenever the owner of any real property (*prædio*) transfers the *dominium utile* of such property to another person, who binds himself to pay to the owner a certain fixed

* *Gr.*, Ἐμφύτευσις. Ingrafting, implanting; and, perhaps, met. amelioration.

rent, called a 'fôro' or 'canon.'" The landlord, who thus retains for himself only the *dominium directum* of the land, is called the Directo Senhor or Senhorio; the tenant is called the emphyteuta, or, more commonly, the Foreiro. The history of the origin and mode of growth of this description of tenure, which has had a most important share, from the earliest times, in the agricultural and social development of Portugal, and which is ingrained in the habits and traditions of the people, is as follows:—

The Romans, it is well known, when they conquered a country, occasionally left the land in the possession of the inhabitants, and at other times divided it among settlers or the victorious soldiery. The occupiers, to whichever of these classes they belonged, paid an annual fixed rent to the Republic, called vectigal. Squatting was also permitted on some of the unreclaimed lands of the conquered country, the squatters being held to pay to that State a fixed proportion of the fruits of the soil, and a varying quota of the live stock. Another portion of the unreclaimed lands was reserved for the benefit of the State or of the municipalities. The decurions, who were charged with the administration of these lands, let them on leases, some of which were originally terminable, but which all tended to become perpetual. These leases did not, however, convey any portion of the ownership, and the tenants were liable to have their rent increased, to be evicted whenever the State alienated the dominion, and thus to lose the benefit of any improvement effected by them. Such risks tended naturally to prevent the tenant from ameliorating his holding, and hence to defeat the object of the lease. By degrees, therefore, the improvements made by the tenant were secured to him; he was guaranteed from increase of rent and from eviction, the alienation of the property by the State being held thenceforth to affect the quit-rent only; and, finally, he obtained full power to dispose of the land, which nevertheless remained subject to the quit-rent in whatever hands it might be. The tenant thus, in fact, acquired the *dominium utile* of the land.

Although this tenure must have been familiar to the Romans at a comparatively early period of their history, the epoch at which it was first legally defined, and its Greek name adopted into Roman jurisprudence, is unknown. In the early days of the Lower Empire it was a fully recognized mode of contract, and a law of the Emperor Zenos fixed whatever had therefore been uncertain in its nature and incidents, and decided that nothing but the total destruction or extinction of the holding should exempt the tenant from payment of the quit-rent. Long before this, however, the tenure had become general throughout the Roman Empire, and existed in Lusitania. The conquest of Portugal by the Visigoths, and, subsequently, by the Saracens, substituted new laws and new tenures for those of the Romans, and there is reason to believe that the contract of emphyteuse fell into complete disuse, and did not fully revive until the reintroduction of the Civil Law,* which King Diniz ordered to be taught in his recently founded University of Coïmbra, and which was firmly established throughout the Kingdom by Dom John I, who caused a translation of Justinian's Code to be executed.

The Portuguese Code, bearing the name of Alphonso V, embraced a system of emphyteutic laws, and from this time forward emphyteuse became one of the leading tenures of Portugal, and was applied to cultivated as well as to waste lands, though more commonly to the latter. The Monarch, the great feudal lords, the churches, the monasteries, were all glad to alienate, in this form, waste or other lands which they could neither sell nor cultivate; but, whereas the rents exacted by the Romans had been for the most part moderate, they became, under the new system, in many cases exorbitant, the large and wretched class of non-proprietors being forced to accept, in return for land, any terms which its owners might choose to impose upon them. The rent and other services thus exacted from the tenant became, and still were up to a recent date, so oppressive that it was only with extreme difficulty that he was able, in many instances, to provide himself with the barest necessities of life. These "foros" were often not only exorbitant in amount, but most vexatious also in their variety and in the difficulty with which the means of paying them were procurable. Among the payments stipulated with frequency, by the ancient contracts of this nature, were such things as a quantity of incense, a certain number of porringers, iron tools, shoes, and sea-fish, where the holding was, perhaps, in the interior of a country possessing no roads. The usual services were no less oppresive, and would have been ridiculous but for the ruin in which they so often involved the tenant, who was compelled to kill for his landlord so many brace of partridges or so many couples of rabbits; to catch so many dozen trout; to furnish oxen or beasts of burthen for a journey of a certain distance; to work for the landlord in the fields one day in the week; to break up a certain amount of land for him, &c.'

* The author of the "Memoria sobre a Origem e Progressos da Emphyteuse" makes the origin of the modern contract coeval with the Monarchy, which would carry it back to the twelfth century; but it had certainly not become general before the date assigned in the text.

The tenant had to bear, moreover, the full incidence of all casualties and natural deterioration short of the total destruction of the holding; and the received and frequent usage of sub-letting, or, as it was technically called, sub-emphyteuse, was obviously liable to many of the worst evils associated with collier tenancies. The lease again was not always perpetual, but might be limited to one, two, or three lives, with or without a renewal clause. The uncertainty of the charges and incidents of this tenure led to frequent litigation; and if the tenant, in despair of turning his holding to profitable account, or even of wringing a livelihood from it, determined to sell, he was bound to pay to the landlord (who had also a right of pre-emption), a fine called "landemio," which varied in amount from a fortieth to a tenth, a fifth, and even a third of the purchase-money.

The law of 1832, already referred to, put an end to the grosser and more harassing of these abuses, and the Civil Code has quite recently placed this tenure on a footing, as regards the future, still more favourable to the tenant.

The nature and mode of growth of the tenure of emphyteuse having been thus described, it remains to state briefly what are its leading incidents: (*a*), in regard to contracts entered into subsequently to the promulgation of the Civil Code; and (*b*) in regard to contracts already in existence when the Code came into operation.

(*a.*) In regard to contracts under the new law: The contract of emphyteuse is perpetual. Any contract entered into under this name for a limited term will be treated as an ordinary lease for years. Sub-emphyteuse is abolished for the future, as are also the fine on sales, above referred to, and all other occasional and casual charges other than the fixed quit-rent. The interest on the holding is hereditary, as in the case of freeholds, but the holding cannot be divided without the consent of the landlord, consequently the heirs must arrange among themselves as to who is to retain the holding, which, failing such arrangement, must be put up to public auction. Where there are no heirs the holding reverts to the landlord, instead of falling to the State.

(*b.*) In regard to contracts already in existence before the promulgation of the Civil Code, such contracts will be upheld subject to the subsequent modifications. The tenant shall have the option of paying in money or kind, where there is no clause to the contrary, and he shall have the right to insist upon an uncertain being converted into a fixed rent. Where the amount of the fine upon sales is not expressed in the contract, it shall be presumed to be a fortieth of the selling price. The contract of sub-emphyteuse will be maintained, but the rights of pre-emption will belong, in the first instance, to the sub-Emphyteuta or the Directo Senhor respectively.

3. 4. The contract of emphyteuse must be consigned to a public instrument, and must be registered in order to effect third persons.

5. Already answered.

6. The tenant may freely dispose of the tenement; but the landlord has a right of pre-emption, and the tenant is bound to give him thirty days notice of the price offered. If during that time the landlord does not exercise his right the sale may go on.

Rent.

1. The payment of the landlord may be either in money or kind at the option of the parties.

2. The rent is regulated by competition, and is payable at such intervals as the parties to the contract may agree upon. In practice the rent is usually paid yearly. There is no hanging gale.

3. The landlord cannot raise the rent, nor (even should he stipulate to the contrary) can he evict for non-payment of rent. Rut he can distrain for arrears of rent and interest, and he may evict where the tenant deteriorates the tenement to such an extent that its value becomes less than the value of the capitalized rent, plus one-fifth.

4. See (B), Rent 4.

Evictions.

As to the law of eviction generally (subject to the modifications stated under (D) Rent, 3), see (B), Evictions.

Improvements.

Inapplicable.

Miscellaneous.

1. There are scarcely any relations between landlord and tenant,—the latter having no obligation except to pay his rent punctually and not to ruin the land.

2. The mode of cultivation is that adopted by small proprietors with whom the foreiros are in almost all respects very much on a par.

3. See (B), Miscellaneous 3.

4. The information furnished in regard to agricultural labourers (see answers to Query A, 9) applies to foreiros in the northern provinces.

5. The prevalent public opinion in Portugal as to the advantages of the system of emphyteuse appears to be that it is of most useful operation as an inducement to the cultivation of waste lands, and as facilitating the acquisition of a beneficial interest in the land by those who would be too poor to purchase the fee-simple. It has been seen how large a portion of the soil of this country is still unreclaimed; and it is believed that there is no method by which the deficiency of capital to bring it under cultivation could be so efficiently supplemented as by this. The system has, moreover, long prescription and popular prejudice in its favour, and it meets with so little opposition in any quarter that many landlords are still found willing to let their lands in this form on receiving a lump sum at the commence of the perpetual lease called luvas or gloves. The disadvantage formerly existing, and which have been enumerated above, have been removed by the Civil Code.

6, 7, 8, 9. See (B), Miscellaneous, 6, 7, 8, 9.

10. The only assistance the tenant receives by law, in endeavouring to become the proprietor of his own holding, is the rule that he enjoys a right of pre-emption whenever the landlord alienates the quit-rent. As to the frequency of such endeavours, or of the desire to make them, I cannot speak with certainty.

11. See (B), Miscellaneous, 11.

General Observations.

Having thus traced, most imperfectly I am well aware, but as accurately as the brief period of time at my disposal, the scanty materials available, and my own limited powers would permit, the salient features of the various systems of land-occupation prevalent in Portugal, I propose to devote the few remaining pages of this Report to inquiring what influence those systems, taken as a whole, have exercised upon the material well-being of this country, and to what extent its actual state contrasts favourably or unfavourably with that of Ireland.

It has been seen that the action of the law in Portugal has tended, even in past times, to the acquisition of a beneficial interest in the soil by a very large proportion of the inhabitants; that at the present moment more than 10 per cent. of the absolute population are landholders, and that the number of these is very nearly equivalent to the number of all other persons actively employed in agriculture, while it is three times as great as the whole number of tenant-farmers. It has been seen that the rural is to the urban population as 3 to 1; that manufactures exist on so small a scale as to employ but a small fraction of the population, and to contribute but little to the aggregate wealth of the community, and that the country must therefore, for long years at any rate, seek prosperity in the development of its agricultural resources, for which a wide field is opened in the seven-ninths of its superficial area, which are still without any species whatever of cultivation. It has been seen that if the relations between the larger landowners and their tenants are not all that could be desired, agrarian discontent and agrarian outrage are unknown. It has been seen that modern legislation favours the class of tenants (comparatively small as that class is); that it encourages, although it does not enforce, the granting of leases; that it does in certain cases enforce compensation for unexhausted improvements, even when effected without the landlord's consent; and that its presumptions, where there is no agreement, or where custom is uncertain, are all to the advantage of the tenant. It has been seen that a cheap and efficient system of land registration is in force, and that loans for improvements are easily obtainable upon the security of land, and upon terms which, having regard to the average rate of interest, are moderate. And, finally, it has been seen that the laws in force tend directly to favour the dispersion of, and free trade in, land.

Under these circumstances it would, perhaps, be only reasonable to anticipate that the Portuguese, if not a wealthy, would be at least a well-to-do community; that their standard of living, solvency, independence, and general circumstances would be a high one; that with a soil of average fertility, an exceptionally privileged climate, and unlimited elbow-room, they would raise not only a sufficiency of food to maintain themselves in comfort, but a large surplus for exportation to countries less naturally favoured; that the population, with no appreciable danger of pressing unduly upon the means of subsistence, would expand rapidly and steadily; that improvements in machinery and in agricultural processes would be eagerly adopted, and that a revenue more than adequate to the

demands of a small State possessed of strong natural frontiers, shut off from the necessity of taking part in any European complications, and composed of an orderly and gentle race of men, would be raised without difficulty and without any sensible hardship. How, then, does the case actually stand? The standard of living and comfort among the rural classes has been already described in general terms, and is such as under the less genial sky of Ireland would be almost too low to support a bare existence.

Assuming, with some of the French political economists, that a mean daily ration of 100 grammes of nitrogenous ("azotés") substances for each individual of the absolute population is necessary to the maintenance of a proper standard of vitality and vigour, it has been calculated that, allowing a considerable margin in excess of the ascertained consumption in this country, the daily ration of each Portuguese (taking into account all ages and both sexes) cannot exceed 57 grammes. This quota must be further reduced on considering how much larger is the relative consumption of food in the cities and towns than in the country, and among the wealthier than among the poorer classes; and if the mean daily ration of these latter is taken at 33 grammes each, or only one-third of the requisite amount, the calculation will even then, perhaps, give a result in excess of the truth. But not only is the consumption of food lamentably below the standard, the production itself is no less deficient. Portugal has never, within living memory, grown sufficient corn for her own frugal wants; and the present annual deficiency of her cereal crops is calculated to be equal, on the average, to the total yearly consumption of Lisbon. The increase in the population, again, is so slow, that it is calculated it would take more than two centuries and a-half, at the present rate, to double itself. As regards agricultural improvements, with the exception of the adoption here and there of a few French and American ploughs, and of the more liberal use of manure, the processes here are much the same as they were two hundred years ago. The state of the finances is still more deplorable. A constant and increasing deficit, amounting now to more than a third of the revenue; an enormous floating debt, much of which has been raised or renewed on the most usurious terms; an expenditure which admits of no sensible reduction; an unelastic revenue, all attempts to augment which in any proportion to the outgoings have been frustrated by that "ignorant impatience of taxation," which is, perhaps, more fully developed in this than in any other country in Europe; a system of taxes which is evaded systematically by the rich, and which presses with frightful severity upon the poor. Such are some of the elements of that chronic financial crisis, which is the curse of Portugal and the despair of her Statesmen.

Some materials, I venture to think, for a comparative estimate of the actual state of prosperity as between the two countries will be found in the foregoing rapid survey of the present condition of Portugal, by those who are familiar with the corresponding facts in regard to Ireland. In further elucidation of this part of the question I beg to subjoin a Table, the figures in which are, for the former country derived mainly from M. Ribello da Silva's work so often cited, and for the later from "The Statesman's Year Book for 1866."

		Portugal.	Ireland.
Area—English square miles		34,573½	31,874
Population*		3,986,558	5,798,967
Population to square mile		115⅓	181
Area	acres	22,125,358	20,391,131
Area under tillage†	„	3,222,883	5,672,980
Acreage under wheat‡	„	618,985	279,863
Acreage under oats	„	29,652	1,869,918
Acreage under potatoes	„	33,356	1,039,282
Acreage under green crops ..	„	165,250	1,475,535
Meadows and pasture lands ..	„	494,200	..§
Total number of cattle		523,248	3,257,309
Total number of sheep		2,417,049	3,363,068
Total number of pigs		858,334	1,056,245
Total number of horses		69,749	564,361
Total value of live stock		£6,670,000	£30,085,082
Taxation per head of population		£0 19*s.* 1*d.*	£1 3*s.* 5*d.*

From the foregoing Table it appears that Ireland, with a smaller superficial area, but with a far denser population, tills a much larger part of her soil than Portugal; and must

* Portuguese Census of 1864, and Irish Census of 1861.
† Exclusive of 741,300 acres lying fallow.
‡ Besides 769,716 acres under Indian corn.
§ I have not been able to ascertain the acreage in Ireland of meadows and pasture lands—a most important element of comparison.

raise from that part an amount of corn still larger in proportion; since, though I am ignorant of the average yield from seed in Ireland, it must far exceed the average of Portugal, which from wheat is not more than six or at the outside seven fold. The total number of live stock raised in Ireland is enormously greater than the number raised in Portugal, and the annual value of the live stock in the former country is more than four times the value in the latter. As regards taxation, the two countries are nearly on a par, and both are lightly taxed; but it may be doubted whether, taking into account the real wealth of either, Ireland has not the advantage in this respect also.

With the inferences to be drawn from the foregoing statements it would be presumption on my part to deal, and any such inquiry, while it would undoubtedly be beyond the scope of this report, will be most easily made by those who are best acquainted with the copious statistics and the mass of evidence which have been accumulated upon the subject of land tenure in Ireland. It may perhaps be submitted with some confidence, that the laws which now regulate land tenure in Portugal are on the whole wise and equitable; and if the results have not as yet been more encouraging, I am anxious to guard myself from any appearance of taking a pessimist view of the future effects to be anticipated from them. It must be remembered that a generation ago vast quantities of the land were held in mortmain or tied up under entails; that the burdens upon the land were infinite in their vexatiousness; that there were no roads—and no popular education; and that the large and bold reforms which have since been carried out in all these respects, are only now beginning to come into efficient operation. An intelligent interest is now being steadily developed in all questions of rural economy; the stagnation and indifference of centuries is gradually yielding before the spread of enlightenment and the increased intercommunication of persons and ideas due to the improvements effected in travelling; and there is, therefore, no reason to doubt that Portugal may yet attain the high degree of prosperity to which her ample natural resources and the amiable character of her people certainly entitle her, and which will then be founded on a surer basis than she possessed even in the apparently vast resources which marked the proudest days of her old Colonial Empire.

Lisbon, December 4, 1869.

No. 16.

Sir C. Murray to the Earl of Clarendon.—(Received December 15.)

My Lord, *Lisbon, December* 10, 1869.

I HAVE the honour to inclose herewith to your Lordship copy of a despatch which has been addressed to me by Mr. Doria, Her Majesty's Secretary of Legation, transmitting a Report upon the laws and customs affecting the tenure of land in Portugal, in accordance with the instructions conveyed to him in your Lordship's Circular despatch of the 26th of August.

I have, &c.

(Signed) CH. A. MURRAY.

Inclosure 1 in No. 16.

Mr. Doria to Sir C. Murray.

Sir, *Lisbon, December* 10, 1869.

I HAVE the honour to inclose to you for transmission to the Earl of Clarendon my Report on land tenure in this country.

The materials for writing on such subjects in Portugal are very limited, which renders the task more difficult than in other European countries where statistical returns published by the Government afford a ready means, easy of access, for procuring the necessary facts, and one on which reliance may be placed as to their correctness. Such returns are, however, in most instances entirely wanting in Portugal, and I would therefore avail myself of your kind medium to invoke and throw myself on Lord Clarendon's indulgence to excuse any want of information in my present Report, on a subject having reference to the important question of land tenure in Ireland, in which instance it is my great desire to

furnish information which may be of use to Her Majesty's Government, in their deliberations on this question.

I have, &c.
(Signed) WM. DORIA.

Inclosure 2 in No. 16.

Report by Mr. Doria on the Laws and Customs affecting the Tenure of Land in Portugal.

I OUGHT to premise this Report with the following remark, viz., that my inquiries have necessarily been confined almost exclusively to the tenure of land in the Province of Minho, a superficies of about 648 square miles.

In this province land is nearly all held under one system of tenure called emphyteusis, a system represented as favourable to the interests of the tenant, productive of increase in the population favourable also to the extension of agriculture, and containing within itself incentives to exertion to stimulate the tenant or farmer to render the soil as productive as possible.

The inhabitants of the province are calculated at about 1,000,000, or a fourth part of the inhabitants of the whole Kingdom. It is the most cultivated province in Portugal, and one in which the least poverty is said to exist.

In speaking of the system of emphyteusis, which divides the tenure of the land into two rights, I have adopted the appellation of proprietor for the possessor of the soil or first right, who receives an annual rent for his interest in the land, and the name of perpetual tenant I have employed to designate the possessor of the second right or power over the land, to cultivate, or make use of at pleasure. The term generally used is "casero," or farmer, but possessing, as he does, a right over the land, he is also called proprietor, and is easily confounded with the proprietor of the first right; by making use of the term perpetual tenant it at once distinguishes him from the first proprietor, making a distinction also between him and tenants under ordinary leases, and designates at the same time that the tenure spoken of is emphyteusis.

To the proprietor, however, the tenure emphyteusis is a source of much trouble and vexation, and does not consult his pecuniary interests, which arises from the extremely small division of property and the consequent large number of perpetual tenants. My informant stated that he had no fewer than 500 tenants, and that so numerous a tenantry produced an annual income of about 1,600*l.* Many of them pay a rent of 2*l.* or 3*l.*, others only a few shillings.

Near Vianna, in the same province, the same gentleman informed me on a property belonging to him of about a kilometre square, there were twenty-two tenants, the land yielding twenty carts of Indian corn, worth on an average 100*l.*, or 5*l.* the cartload. Of these 500 tenants, with rare exceptions, the most wealthy would not have a larger income than 80*l.* per annum, half of which would be expended on the tillage of the soil; the rest would serve for the maintenance of himself and family. From a farm of this annual value the proprietor only receives 12*l.* rent. There are, however, very few perpetual tenants in such satisfactory circumstances.

One of my informants stated that in the Minho there are not more than 500 persons out of a population of about a million who, as perpetual tenants, do not possess a small bit of land, frequently with a house, paying perhaps only a few pence rent. The perpetual tenant-right had been obtained probably two or three centuries ago, and when obtained was far from the town or village which had extended and brought it within its limits.

Much uncultivated land of such a description still exists in the Minho, virtually belonging to the Crown, but which the Corporations lease at a very small rent under the system emphyteusis; my informant added if the country was properly governed no instance of extreme poverty or destitution ought to exist in the Minho, and that only in cases of sickness or infirmity.

To judge, however, from my own observation the peasantry appeared poor and exposed to hardship. I learnt from statements I received that they rarely or never taste meat; their dinner consists of "caldo," or soup made with a little pork fat or lard, beans, and cabbage. The bread is made from Indian corn and rye. The wine is made from their own vines. At breakfast farm servants are given a salt daigne or backala salt fish. The women's dress is often made from a mixture of wool and linen woven by themselves.

The recent changes effected by the Government in the system of the tenure of land in Portugal are singularly adapted, and apparently expressly framed, for the benefit of the finances of the State.

Every opportunity is seized to necessitate the transfer of land, and a fine of 10 per cent. is exacted, payable to the Government on the sale of it. In legislating on the same subject this material point has steadily been kept in view, thus the registration of landed property, and the mortgages connected with it, is strictly required by law; the Government stamp which is affixed on these occasions is another source of revenue to the State.

The extinction and dispersion of old estates ensuing from the law in force has been sought for rather than prevented; there is a direct movement towards democratic institutions, to which all measures of the Legislature for some years have tended. It was accounted for to me in the following manner:—

A class of men have found themselves excluded from the honours and privileges of the old aristocracy, in whose possession the great proportion of the landed estates of the country existed, the first step towards removing this barrier of exclusion was to insure the dispersion of landed property, which in many instances the large debts of the aristocracy rendered easy. The abolition of the right of primogeniture and other reforms introduced by the Codigo Civil continue to promote the movement.

With regard to land tenure in the other provinces of Portugal, that of Beira is nearly the only other part of the country in which the system of emphyteusis prevails to any extent. In Alemtejo the land is let on lease, and there estates of much greater extent are to be met with. For instance, an estate recently sold in that province was purchased for 80,000*l.* sterling.

The value of a "foro," that is, the right vested in an estate by a perpetual tenant, is generally calculated at twenty-five times the annual amount he pays to the proprietor.

Another blow dealt against the agglomeration of landed property is the abolition of Prasos de Vita, a sort of right of primogeniture belonging to the system emphyteusis, which the perpetual tenant possessed, that is to say, a right which allowed a property to be left as an undivided inheritance for three generations. This privilege the Codigo Civil has for the future done away with.

In conclusion, I should state that I found a want of knowledge on all subjects of inquiry relative to comparative statistical information. I have, as far as lay in my power from the inadequate means of research I possessed, answered the questions which form the inclosure to Lord Clarendon's despatch, the substance of which I gathered in conversation and from personal observation during my short visit to the Province of the Minho.

To a work by Senhor Rebello da Silva I am indebted for the opinions on land tenure in general in this country, which forms the second and concluding part of my report. From the Portuguese Government I have not been favoured with any information.

The persons to whom I owe the information I gathered during my stay in the Minho, and to whom the question of land tenure in Ireland did not appear to be foreign, expressed an opinion that the system of emphyteusis was calculated in many respects to meet the exigencies of the question in Ireland; but, though candidly admitting the advantage derived from that system to the perpetual tenant, the flourishing state of the Province, admitting also the large amount of population in proportion to the rest of the kingdom, all benefits attributed to that system, they did not conceal that to the proprietor it offered many great disadvantages.

The real superiority of the system is most apparent in instances of reclaiming large tracts of uncultivated land.

(Signed) WM. DORIA.

Answers to Queries.

In the Province of Minho the system of land tenure is nearly exclusively confined to the system called emphyteusis.

PERPETUAL TENANT OR SMALL PROPRIETOR.

1. The quantity of land held by each is very small and very much intersected.

2. The owner can select his heir to inherit one-third of his property, the remainder is equally divided among his other heirs or children. Formerly, an estate under emphyteusis could only be sold, entire, and the heir selected by the proprietor was often necessitated to do so in order to meet payment of the remaining two-thirds of the property. The Codigo Civil has altered the system, and allows an estate to be sold in portions.

3. The legal method of sale is by application to the Finance Department of the municipality, from which, on payment of 10 per cent. on the value of the estate to be

sold, a certificate is received, and subsequently the contract of sale is drawn up by a public notary, by whom, in the presence of two witnesses, it is signed. The contract must be registered by the constituted authority of the municipality to secure its validity.

4. The Government does not lend money. A bank under the name of Banco Predial, established with the Government sanction, advances money at 7 per cent. on land mortgage, subject to the condition that the property should be of twice the value of the amount advanced; 1 per cent. is retained for amortization of the debt. The Bank of Portugal, in Lisbon, that of Minho, of Oporto, and the bank called "Utilidad Publiga" also lends money on the same conditions.

5. Properties in general are heavily mortgaged paying 9 and 10 per cent. There are of course exceptions.

6. The registration of landed property is strictly enjoined by law. There is a Government office for registration; all mortgages are required to be inscribed in the register. To this system the Bank Predial owes its security, that an estate on which it advances a loan has no anterior debts upon it. Expenses of registration amount to about 4*s*.

7. On land not very dry, rye and Indian corn are grown year after year, allowing a grass crop after they have been cut; to vary the crop potatoes and onions are sown. Rye which requires much manure is often followed by a crop of flax. Cabbages are much cultivated in the grass fields, a species brought from Galicia, growing 5 and 6 feet high. The same plant is preserved for a length of time, from which only the leaves are gathered. In the Minho no wheat is grown, it is imported from the Southern Provinces. No regular system for alternation of crops seems to be adhered to.

8. Machinery is unknown as a substitute for manual labour in agriculture. Little enterprize is manifest in the country. The poor husbandman cannot afford outlay; the richer is indifferent and hords his money.

Female labour is largely employed, as much as 50 per cent. The village of Tifa, near Vianna consists entirely of female population, the men returning at stated periods of the year. Women perform the offices of the men in all agricultural labour throughout the Minho.

Male labourers' daily wages, without food 200 reis or 1*s*.; ditto with food, 6*d*.; female abourers' ditto, without food, 150 reis (9*d*.); ditto with food 4½*d*.

9. The annual number of emigrants is said to vary greatly, 2,000 have been known to go to Brazil in one year, to which country emigration from Portugal appears to confine itself; the annual average number may be stated at 300. The hope of realizing a fortune is the cause principally assigned, and to the excessive aversion existing against military service, to escape which the peasant not only leaves his country, but voluntarily mutilates himself to avoid the conscription, in such abhorrence the service is held owing to the Government failing to fulfil its engagements as to length of service and pensions.

10. The perpetual tenant, otherwise called proprietor, lives on the land which he cultivates, or in a house or cottage adjacent to it.

11. I saw none equal to the rank of, and living in the comfort of an English farmer. They are poorly clad, and are more in the position of a labourer than of a farmer as regards their outward circumstances, compared with farmers and labourers in England.

13. The system of emphyteusis is stated to be beneficial in its results as regards the extension of agriculture, and tends to augment the population; it was, I believe, popular alike with the proprietor and perpetual tenant. The introduction of the reforms emanating from the Codigo Civil are certainly not agreeable to the richer and the higher classes of old proprietors; the changes introduced have a direct effect in disseminating landed property, assimilating it to other articles of commerce, necessitating its purchase and sale as frequently as possible. The sub-division of property naturally facilitates and increases the recurrence of such sales, and the legislation takes every occasion to render such sales obligatory, thus placing within reach of the less wealthy the acquirement of land, from which the poor man would otherwise be debarred. The measurement of land by its extent is unknown, not heard of. The value and its extent is calculated by the number of cart-loads of corn which it produces. With regard to population the nearest calculation I could obtain, gives about 1,500 inhabitants to the square mile.

Sub-Tenants.

Sub-tenants were formerly permitted on property under emphyteusis. The Codigo Civil has abolished that permission, and has also ruled that accumulated rent after five years, if not demanded by the proprietor, is forfeited to the tenant. The system of registration for contracts on lease of property, as already explained, is enforced by law at a Government office.

5. The perpetual tenant remains by right in occupation of his holding so long as he punctually pays to the proprietor the annual rent-charge.

Under other systems the tenant cannot, in opposition to the landlord, continue to occupy his holding, longer than the term expressed in the lease.

6. The perpetual tenant can, with the consent of the proprietor, sell his interest in the land; the purchaser and proprietor remain in the exact position and relation to each other as existed between the former perpetual tenant and himself. The mutual consent of both is also requisite to enable the proprietor to sell his interest in an estate.

Rent.

Emphyteusis admits of great variation with regard to payment of the proprietor, which is regulated by mutual agreement. Sheep, pigs, poultry, vegetables, are often added to the more weighty payments, in corn or money, by express stipulation. Sometimes a share of the produce only is stipulated for in other cases, but rarely payment is made in money. In regard to leases not emphyteusis, the rent, as regulated by the Codigo Civil, is settled by agreement between the proprietor and tenant.

3. Under emphyteusis the proprietor has no power to raise the rent, a provision in favour of the tenant introduced by the famous Marquis Pombal. On non-payment of rent the landlord can evict the perpetual tenant, whose right in the land is sold by auction. Under ordinary leases the landlord can raise the rent at will, subject of course to conditions stated in the lease. Such instances rarely occur.

4. Legal means for recovery of rent under emphyteusis, is, application for judicial permission to sell perpetual tenant's right over the land.

Under other systems the law permits the proprietor to distrain for the rent, when the tenants goods and chattels are sold. Sixty days previous to rent day notice must be given if the landlord intends to discharge the tenant. The landlord, before all other creditors, possesses the privilege of the first charge on the estate.

Evictions.

It is usual for the proprietor to wait for his rent until the harvest is over to enable the tenant to realize the money necessary to meet the payment. Evictions are not unfrequent owing to irregularity in paying the rent.

Improvements.

Under emphyteusis improvements are executed by perpetual tenant, as he alone reaps the benefit of them. Under ordinary leases express stipulations regulate by whom they are to be incurred. The tenant is obliged to plant if the proprietor furnishes the trees.

2. The tenant can reimburse himself for money laid out on improvements which have been effected with consent of the proprietor, by retaining the expense from the rent, or by continuing to hold the farm until he is indemnified by the proprietor.

5. Perpetual tenants have the same facilities of obtaining loans from the Banco Medial as the proprietors, and from other banks already named in my Report. Other tenants are almost excluded from doing so from the nature of the conditions required by the Banco Medial.

Miscellaneous.

The relations between landlord and tenant are friendly. No case of murder by a tenant of his landlord is on record. The Codigo Civil has in some instances legislated for the benefit of the tenant; it has, for example, reduced the fine paid by the perpetual tenant to the proprietor on the sale of his interest in the property to $2\frac{1}{2}$ per cent., which fine formerly consisted of one of the four following sums, 20 per cent., 10 per cent., 5 per cent., or to $2\frac{1}{2}$ per cent. The new law, though it has reduced the fine, has, however, imposed the tax of transmission amounting to 10 per cent., to which must be added the expenses of registration, amounting to about 4*s*.

(Signed) WM. DORIA.

Part II.

Agriculture in Portugal is carried on under different systems of tenure, depending on the extent of land and the produce cultivated, the principal of which are the following:—

First, when the proprietor cultivates his land on his own account.

Secondly, when the proprietor lets his land to a tenant for a fixed time at a fixed rent.

Thirdly, when the proprietor and tenant, conjointly, cultivate the land under an agreement, varying according to the land and its produce.

The fourth system is that called "emphiteutico," when the proprietor divides the lordships in two rights—the right of possession and that of cultivation, and cedes the latter for an annual rent-charge.

All these systems offer both advantages and disadvantages, depending on the locality and the habits of the country. The Codigo Civil, promulgated in 1867, by legislating on these matters will simplify many difficulties which it is desirable should be done away with. There is, however, in these four systems enough to arrest attention in the hope of arriving at a state of improvement which they are susceptible of.

In cases where the estate is small, everything leads to the conclusion that the proprietor should himself cultivate the land, uniting the characters of capitalist and farmer.

When the estate is large, this arrangement possesses disadvantages. The proprietor is perhaps rich, and has not the aptitude requisite, his pleasures and other occupations interfere, in which case an agent is better employed.

Short leases of three years, for example are not beneficial. The fact of their being short tends to extinguish in the farmer all desire for the improvement of the estate, and creating in him an apathy arising from a want of personal interest in the amelioration; a farmer will not risk laying out money under such conditions; longer leases would tend to the progressive improvement of the soil. With regard to securing the interests of the proprietor, it would be sufficient to insert a clause for renewal of the lease at an increased rent in proportion to the increase of produce. The proprietor and farmer equally benefited by the increase of produce from the estate, would, therefore, be natural friends.

The great problem in every system is, to obtain as much profit as possible with the least expense in the shortest time; stipulations and guarantees should be made and given against impoverishing the soil, and for its improvement.

The necessity of finding a just means for remunerating the farmer for money expended on improvements is not so easy. Perhaps if leases were granted for thirty years, with a clause for an increase in the rent after every seven years, ths proprietor would obtain his share of the improvement while the farmer would be secure of reaping also the same benefit for a number of years.

The Codigo Civil, in treating the question of leases, lays down general rules with clearness. Its sanctions any arrangement the contracting parties may wish to agree upon, except in cases when the estate is in trust, as a marriage settlement, or belong to minors, or to persons unqualified to act for themselves. When no term is specified in the lease, it is understood that it is for the term usually known in the country; when doubt exists on that point, the lease is reckoned for such a time as may be requisite for once sowing and reaping the produce of the estate.

The farmer, when the length of lease is undetermined, on wishing to quit the farm, must give notice sixty days before expiration of the agricultural year. The proprietor is bound by the same rules.

The farmer cannot advance a claim for diminution of rent on account of bad season or failure of crops.

The Codigo Civil legislates for all the provinces, even where special customs were in use.

The conjoint system of farming consists in the proprietor affording the land on agreement of receiving a portion of the produce. On the death of one of the contracting parties, the heirs are not bound by the contract. The farmer, however, has a right to reap the fruits of the current year unless the heirs of the proprietor consent to give a fair remuneration. The farmer is bound to give notice to the proprietor before he gathers the crops. The farmer is bound to supply seed for sowing, unless stipulation is made to the contrary. The most difficult point in the conjoint system is the division of produce for payment of rent in kind. Fraud on the part of the farmer is of frequent occurrence, which necessitates a watchfulness on the part of the proprietor which also becomes vexatious and oppressive. Nevertheless, there are circumstances where the system can be carried on with advantage notwithstanding its known imperfections; for instance, when the absence

of capital renders the association almost a necessity to avoid rural poverty, the proprietor affords funds for drainage, irrigation, planting, &c.

In Bavaria this system is very general, and attended with most profitable results. Emphyteusis, as already explained, is a double right—that of possession by the proprietor, that of cultivation by the second proprietor or perpetual tenant. If the emphyteuta, or perpetual tenant, wishes to sell his right of cultivation, he must obtain the consent of the proprietor, who has the priority of right to purchase it, if he wishes, on condition of paying the sum offered by any other purchaser; on sale of his right in the estate by perpetual tenant a fine is paid to the proprietor, which varies according to original contract. The emphyteuta has entire power over the land, to do with it what he pleases, on condition of payment of the annual rent.

Formerly emphyteusis was limited to one, two, or three lives, with or without a clause providing for renewal of contract. The renewal was considered an act of generosity on the part of the landlord or proprietor. Modern law has in this instance favoured the emphyteuta.

A great difference existed with regard to succession of property under emphyteusis. Thus while property not under that system of tenure could be divided amongst the heirs of an estate, property under emphyteusis could only be retained under one proprietor not possessing the right of sub-division, but only that of power to sell in order to distribute and divide its value among the co-heirs. The emphyteuta could select his own heir; if he died without naming his successor, or intestate, the succession followed the general rule.

The Decree of 1832 greatly alleviated the position of the emphyteuta, relieving him from many contributions to monasteries, to brotherhood, &c., and reducing the whole charge to a fixed annual rent and fine on sale of right.

In the northern provinces of Portugal, where this system of land tenure prevails, it is considerad by persons whose opinion is worthy of being received as the cause for the increased population and general prosperity of the country, an increase and well-being, however, which only dates from 1832.

Emphyteusis was a system of great anomalies. The Codigo Civil has laid the basis for reforms which was loudly called for, and if it has not yet brought the system to one form of lease, it has simplified the question.

Legislation has not realized all its hoped-for improvements, and by degrees may make greater advancement, and it would be impolitic by arbitrary measures to do away at once with a system which has for centuries been in force in the northern provinces; moreover, the advantage gained might be counterbalanced by the opposition such a law would meet with. So time must be left the task of carrying out scientific suggestions; while experience teaches that great reforms triumph only when the moment for their adoption has arrived.

Lisbon, December 10, 1869.

No. 17.

Mr. Strachey to the Earl of Clarendon.—(*Received December* 21.)

My Lord, *Copenhagen, December* 18, 1869.

I HAVE the honour to inclose my Report on Land Tenure, Agriculture, &c.

The points which I would detach from the whole, as most worthy your Lordship's notice, are:—

1. The Danish Law on Compensation for Improvements;
2. The System for Registry and Publication of Deeds and Mortgages; and,
3. The Danish Agrarian Revolution, now in process.

I must beg to be furnished with a proof, should the Report be made public. Your Lordship will perhaps concur in my opinion, that responsible work of this kind has at least as much need of the author's revision as an anonymous article in a newspaper or review.

I have, &c.

(Signed) G. STRACHEY.

Inclosure in No. 17.

Report on Tenure of Land in Denmark.

Introductory.

THIS Report answers all the questions on the official list, with which I have discovered corresponding facts in Danish legislation and experience. The various data are collected into distinct points of view, on the following plan:—

Part I is a systematic exposition of the Danish laws on tenure, sale and transfer of real property, compensation for improvements, evictions, registry of deeds, sub-division and accumulation of land, inheritance and bequest.

Part II treats of the Danish system of tillage, of the management of stock, of customary modifications of the law, of the position and relations of proprietors, farmers, and labourers, and of other miscellaneous agricultural matters.

Part III is a short history of the agrarian reform now in process in Denmark, whereby the tenant-farmers are becoming the proprietors of the soil; it notices the chief concomitant circumstances, political and social, of the said reform, and sums up its results.

In view of comparisons with Irish and English questions I would specially fix attention on these points.

1. Danish legal practice (I may almost add theory) grants the tenant-farmers something like a concurrent ownership in the ground. Such right is enjoyed by them collectively as a class, not generally as individuals. Almost every incident of leasehold tenure is affected by the Statute Book. Leases, compensation, and evictions have been incessantly the subject of minute legislative precaution.

2. Under an ancient system for registering and publishing contracts, the titles and encumbrances of every field in Denmark may be immediately ascertained by intending purchasers and mortgagees.

3. During the last forty years the tenemental farms of the kingdom have been in process of conversion into freeholds, which change, now nearly completed, has been effected by the joint action of public opinion and permissive legislation.

4. The new freeholders are substantial yeomen holding sixty or seventy English acres where the soil is good, more where it is poor.

5. The freeholders and the leaseholders of the old class, with the smaller peasant proprietary and the agricultural labourers, have now a majority in the Folkething, or Second Chamber, where many peasants themselves sit.

6. The "peasants' friends" are the so-called democratic party of the country. Their programme includes, besides several articles of political, economic, and religious reform, the conversion of the remainder of the tenemental farms into freehold property.

7. The consciousness of his altered relations to the soil and the State appears to have exercised a salutary social and moral influence over the Danish peasant.

8. But looking at all the circumstances of the case, and, in particular, to the fact that the latter stages of the agrarian movement have been connected and coincident with a great constitutional change, it would be rash to assert that the recent extension of freehold tenure and the recent improvements in Danish agriculture make a sequence of cause and effect.

As the subject of this Report is a burning one here, I forego the pleasure of thanking by name several distinguished persons, political, legal, and agricultural, who have helped me with information and advice.

The first chapter was compiled almost exclusively from my own analysis of the original ordinances and laws. The chapter on agriculture, &c., is based on explanations given me by the best authorities, and on my own observations. The historical chapter is derived from private communications, books, reviews, pamphlets, and newspapers; the literature of the freeholder controversy is extensive and important. I can safely say that my own opinions as given in the Report were formed after the facts had been collected and not before. Many of them are, in fact, the reverse of those at which I should have thought myself likely to arrive.

Appended to the Report are Tables of population, crops, animals, tenure, &c. The figures in the text are generally in round numbers.

[Danish readers will be good enough to note that the writer is not yet thoroughly acquainted with their language, and that he had not above six weeks at his disposal for the preparation of the Report.]

Chapter I.—Legal.

(A.)—*Tenure.*

Danish estates of the old type bear an apparent likeness to the Manors of our Domesday Book. Whereas the Norman and (under other names) the Saxon. Manor, was divided into (1) demesne and (2) tenemental lands, the Danish "Sœdegaard," or Family Seat, consists of (1) the "Hovedgaard," or demesne round the mansion, and (2) the "Bönder gods," or portion occupied by small farmers.* Between the demesne or tenemental land the law has drawn a fast line, keeping the two species of property rigorously apart by ascribing to each separate rights and obligations. The "lord-drot," or lord, of an unentailed estate, may sell or lease his demesne as he thinks fit. But his proprietary rights over the tenemental lands are so conditioned as to give the occupants a kind of joint ownership in the surface of the soil. According to the Code 1683 of Christian V, the Danish Justinian, a Family Seat should lie near or amid tenemental farms rated in all at 200 "Tönder" of "Hard corn," say 2,000 acres.† The "Sœdegaard" had special fiscal immunities, and its owner was not bound by the regular law of bequest. The rule of area above given was not always observed, and it has been modified by later legislation. There may be 600 of these estates, which, however, are now rapidly dwindling in size owing to the conversion of their tenemental farms into freeholds. But if their part in the Kingdom's theoretical "Hardcorn"‡ be diminished, their importance is, on other grounds, considerable; and a clear comprehension of their position in law is an essential preliminary to an understanding of Danish agrarian questions.

A "Sœdegaard" may be a freehold in fee-simple (I use this expression as the nearest English equivalent), or an estate in tail. If entailed, it may belong to the "Stamhuse" (1), or to the Fiefs (2). The "Stamhuse" (1) correspond in part with our own entailed estates. As the Danish law knows no "fine and recovery" the entail cannot be legally barred. But the Crown has in some cases allowed the conversion of such estates into money trusts, and in others removed the entail. The lands, as well as any personal property tied up with than by the Fidei-commissary band, must descend in perpetuity as a family possession, to be enjoyed after the manner indicated by the founder's deed. The usufruct commonly follows the rule of primogeniture. The Fiefs (2), or estates of the Counts and Barons (thirty-two in number), have all been created since the establishment of the Absolute Government in 1660. They enjoy certain privileges, legal and other, and descend by primogeniture. On failure of the line they revert to the Crown.

The constitution of 1849 forbids the erection of fresh entails, and promises that estates of *this* class *shall* be converted into free property. No Bill has yet been passed in such a sense. The Government exercises a certain control over entailed estates, taking care that the usufruct is held according to the founder's intentions. By a recent

* A glance at the etymologies of the chief technical words used in the Report will, I think, facilitate the comprehension of a difficult subject.

"Hovedgaard," either "head-house ("gardr," in Icelandic, is house, hedge, inclosure), or farm ("curia capitalis"), or a "gaard" attached to the "hov" or temple. "Hoveri" ("corvée") was probably in its origin the service due to the priests of the heathen "hov."

"Bonde," peasant, is referred to "bo," house, and "boe," to dwell (Icelandic, "bû," and "bûa"). Before towns existed, every free man was a "boende" (participle) or "bonde," in opposition to the mere "trœl," and the more elevated "Jarl," or King's man. The more powerful peasants were "storbendr," or great peasants, which phrase is still applied to the great landholders.

By degrees the word "bonde" and its associated terms were narrowed in use. The tenemental farmer, now "fœster," was "landbo" (Latin, "colonus"); his farm was "landbostavn" ("colonia;" modern Italian, "colonia," or métayer farm). The peasant (in English history, the copyholder) of the demesne, was "gärdsœden" ("inquilinus"); he was the forerunner of the modern "huusmand," or labourer. Above these was the freeholder, or "adel-bonde" (Latin, "bundo"), the "selveijer" of our times.

As the "bonde" degenerated into thraldom, his name began to connote ideas of inferiority and servitude. The word is now once more an honourable title. Freeholders and farmers are "little peasants," great landholders "great peasants." In law, the "bonde" is anyone, of whatever social rank, who owns an estate of 10 acres of land, at least, and 120, at most.

† Compare this rule with the Anglo-Saxon rule (or custom) that a Thane's estate should be of 5 hydes, or 600 acres, with a house and church. I am informed by the first authority on such points, that in ancient Kent about one-third of each manor used to be in demesne; say, one ploughland in demesne, and two and a-half ploughlands held by socage tenants.

‡ In the Danish cadastre, or "matrikul," all the land of the Kingdom is rated for fiscal purposes according ot its capacity for produce. Arable of the best or normal class is marked 24, the worst 0, an infinite number of fractional ratios connecting the extremes, so as to admit of every field in Denmark being fairly taxed. Of the 24 land, 7,200 square ells, or $5\frac{1}{7}$ tönder of land (1 acre equal to 0·75 tönde) are supposed to be able to produce 1 tönde of hardcorn (rye and barley: 1 tönde of grain equal to 3·87 bushels); therefore 12 land would have $10\frac{2}{7}$ tönder of land for 1 of hardcorn, and so on. For pasture land, hay is the measure of capacity; for common, the potentiality for feeding animals; for wood, the number of swine. In Jutland, 15·4 tönder of land is the average to 1 of hardcorn, equal, in the islands, which are more fertile, to 8·8 tönder of land. The proportion usually taken for rough calculations is 10 tönder of land to 1 of hardcorn.

law the tenemental lands of entailed estates may, in a way prescribed, be converted into trust monies—a point which will be explained hereafter.

I pass from the "Sœdegaard" as a whole, to the "Hovedgaard" (1), or demesne, with which the owner of an unentailed estate may deal as he pleases. This part of the property formerly enjoyed considerable fiscal immunity, being said, in consequence, to be "free earth;" it is still, as a rule, exempt from tithe.* The "Hovedgaard" is never split up into separate farms. When it is leased the legal relations of landlord and tenant are entirely dependent on the contract. Neither side has any rights or obligations as regards the other, except such as derive from express agreement. Granted, *ex absurdo*, the absence of a written lease, the law makes no presumptions whatever, in favour of, or against, either party. The *onus probandi* falls on the raiser of the disputed point, and proof is not easily established by the complainant. If, however, a manorial tenant die before the expiration of his term, his heirs inherit the lease unless the landlord notifies that he resumes the farm. The lease of an entailed manor is, properly speaking, broken by the owner's death, but the Ministry of Justice does not insist on the observance of this restriction.

Attached to the "Hovedgaard" are the "Böndergaarde," or peasants' farms. These farms may not exceed 120 acres,† and must have a mininum area of from 10 to 15 acres. Every farm is necessarily kept apart from the demesne, and let to a separate tenant on a lease for his own life and that of his widow. This species of tenure is supposed to have been common in Denmark at the date of the issue of the Code of Christian V (in 1683). That Code forbids the "Jorddrot" to throw tenemental farms into the demesne, and the language of later laws is distinctly tantamount to the admission that the peasantry as a class, (not generally, of course, but collectively) have a claim to continue on the soil as long as they comply with certain conditions of tenure fixed not by the landlord but by the State. It is a matter of dispute whether or not the "Fœstetvang," or obligation to lease on two lives, was a positive legal fact enforced by penalties, to the exclusion of other shapes of tenure, before the issue of an Ordinance of the year 1790. However, that may be, the existing law is so jealous of infringements of the "Fœste"‡ principle that when any "Böndergaard" is converted into a freehold, twenty years must elapse from the time of its purchase before it may be let otherwise than on the two lives system, or on the fifty years' tenure named immediately below.

When the farm of a "Bonde" becomes vacant, the landlord must assign it to a new tenant within a year and fourteen days. The exceptions are:—

1. If no tenant offer a fair rent, and the landlord can establish the fact, he may, under severe restrictions, parcel out the vacant "Gaard" amongst adjacent farms.

2. The landlord may turn the farm into lots for labourers.

3. He may turn it into plantation, on condition of building two houses, and giving each a small piece of ground.

4. He may absorb it into the demesne, on condition of giving up an equivalent of demesne in exchange.

5. He may sell the farm, or convert it into a base freehold called "Arvefœste," which will be described hereafter.

6. He may lease it for fifty years certain, and so doing he is not subject to the general rules of the "Fœste" system. This plan has been growing common of late, and to prevent its abuse the Government has just presented a precautionary Bill to the "Folkething."

On exception 5 I should remark that Danish legislation shows traces of a disposition, till lately, it is true, only intermittent, to encourage the great landholders to sell the farms held on life tenures to their occupants. Just 100 years ago they were invited to move in this sense (see Chapter III), and allowed to diminish their peasants land without compromising the fiscal immunities of their demesnes. In 1854, under circumstances to be related below, a Bill was passed authorizing the sale of the tenemental farms of entailed estates, the proceeds being, with a fractional exception, convertible into trust-money. Bishop Monrad's Bill of 1861, gave all proprietors of "Böndergods," entailed or not, the right, when they had sold nine tenemental farms to the occupiers, or his heirs, to take into their demesne as much peasants' land as might be equivalent to one-ninth of the quantity sold. This rule is generally thus stated—that whosoever sells nine "Fœste" farms may take away the tenth farm from the "Böndergods."

* Country tithes are "Royal" (before the Reformation, "Bishop"), "Church," and "Priest." The two first kinds have been to a great extent impropriated by sale or gift.

† The technical figures are 12 tönder of hardcorn at most, and 1 tönde at least. My explanations will generally give the equivalent (necessarily a rough one) in English acres.

‡ The verb "fœste," in old legal language, means to conclude a bargain with a shake of the hand. The noun means the lease with all its incidents.

The general relations and liabilities of landlord and tenant will be described under the separate heads of—

a. The inspection.
b. The rent.
c. The assignment, forfeiture, and termination of leases.
d. Complaints and evictions.
e. Improvements.

(*a.*)—*The Inspection.*

1. When the landlord and the new tenant have come to a preliminary understanding, two "impartial persons" are called in, one by each party. These persons attest in writing the state of the farm, buildings, and soil. In case of need they may name an umpire; should he be unable to make a report satisfactory to landlord and tenant, the district magistrate has to appoint two more persons for the work, and these may be put on oath. If the landlord considers that improvements are immediately required he must undertake them himself.*

2. The "impartial persons" likewise examine, and appraise in a catalogue, the beasts, implements, and seed, which the law requires the landlord to supply. Should the inventory note a failure of quantity or quality the "Fœster" need pay no rent until his wants are supplied. Both the report before-named, and the inventory, are appended to the deed of lease.

(*b.*)—*The Rent.*

This falls into "gilde," or yearly payment, and "indfœstning," or sum down. The "gilde" is a first charge on the land, as against mortgages or other claims. It is a small rent in money or in kind, or both. If in kind (which would be chiefly rye and barley) it may be commuted at rates officially calculated from the average market prices of grain ("Kapitelstaxt") and published every year. The "indfœstning" is a large sum (say from one-third to one-sixth of the value of the farm) the amount of which, like that of the "gilde," is decided by the parties themselves. The landlord may let the farm by auction, but custom does not allow him to do so. The "Hoveri," or "Corvée," formerly a supplement to the rent, has been abolished, and new contracts for services of work are illegal.

(*c.*)—*Assignment, Forfeiture, and Termination of Leases.*

The contract is twofold. It includes the "Fœsteaccord," or provisional agreement, and the lease itself. To the lease, which is in duplicate, are appended the above-named report and inventory. The lease may be forfeited if the tenant neglects to pay the rent, or to reimburse the landlord for the land-tax, or to keep the farm property up to the mark described in the inventory. Also, if he sublet any part of his land, or sell hay or other fodder so that the ground suffer for want of manure, or abuse the turf or timber, or stir up the farmers against the landlord, or assault him with word or deed. The lease may be determined at the will of the landlord, should he, having no house of his own, wish to live in the tenant's "Gaard." Also, if the "Fœster," by reason of advanced age, and certain other grounds, should be unable to continue on the farm. Should the tenant's widow desire to give up the farm she can do so on terms more favourable to her than to the landlord.

(*d.*)—*Complaints and Evictions.*

On complaint being made to the Sub-prefect, or Civil and Criminal Magistrate,† an attorney is appointed to defend the tenant gratis. For minor breaches of his contract, especially on a first or second offence, the tenant may be fined. Should the case be one of damage to the buildings, land, or stock, the Magistrate sends two persons to make a survey. If they find the landlord's allegations to be true they fix a time within which the

* I have thought it best to give all these rules in the lump. They have grown up gradually. They will be mainly found in the Laws of 1787, 1838, and 1861.

In Denmark every civil suit must necessarily pass through the "Compromise Commission" before it is laid in form. The Commissions are named by the Local Municipalities and Prefect's Councils: they have had a very great influence in preventing useless litigation: a contract confirmed by their authority is treated as an effective and authorized public document.

† Denmark is divided into "Amter" (Prefectures), and these into "Herredsfogdereier" or "Birker" (Sub-Prefectures). The "Foged," or Sub-Prefect is the District Civil and Criminal Magistrate. Appeals lie to the Superior Courts of Viborg and Copenhagen, and, in the highest instance, to the Copenhagen Supreme Court.

tenant must remove the cause of complaint. Should the tenant be recalcitrant, the case comes before the court in form, and the Sub-prefect finally gives an order for eviction. On special occasions the landlord may move the Magistrate to evict the tenant at once, upon which a trial must immediately follow. Unless the landlord make out a good case the tenant has a right to be re-instated. Rent is due on 1st May and 1st October. Neglect of prompt payment is a *primâ facie* ground for eviction. But the tenant may obtain from the Magistrate a delay of four months, and no complaint obtains if payment has been made before the case is called.*

(*e.*)—*Improvements.*

The outgoing tenant, or his heirs, may claim compensation for all improvements *whatever* effected by him which have added to the marketable value of the farm. If the parties cannot agree, two arbitrators, as before, compare the previous report and inventory with the actual state of the farm, giving in a written valuation of the improvements, and taking into account the advantage which the tenant may be presumed to have himself derived from his expenditure. After thirty years from the execution of great, and ten from the date of small, improvements, no claim for compensation is allowed.

The tenant must make good all damages done to the farm by fire, weather, &c. But should the house or buildings be destroyed, the landlord must give him building timber gratis, and the parish is required to afford general help. If both the tenant and his wife die within thirty years from the date of their taking possession of the farm, their heirs are entitled to a pecuniary drawback equal to as many thirtieths of the "Indfœstning" as their years of enjoyment of the lease fall short of thirty. This does not hold if the lease be regranted to one of the said heirs.†

A tenant intending to make large improvements in the ground or buildings must give notice to the landlord in order that a survey may be held on which to base eventual claims for compensation.

Next the "Sœdegaard" is so-called "Avlsgaard," or "Ladegaard," which may be said to derive from it. This exceptional species of estate may have been derived from the accumulation of peasants' farms, or it may be a manor without any such farms, or a manor on which the owner does not reside. It is subject to the legal rules applicable to land of the category to which it belongs in virtue of its origin. If, for instance, it be in the nature of demesne (which, I presume, would be the common case), the law has nothing to say on the subject of its tenure.

Another kind of property is the "Huus," which word in Danish means not only a house, but also an estate too small to be ranked as a "Böndergaard." The house may not have over about 1 "Tönde" hard corn (10 to 15 acres of land), tradition, local usage, and other considerations to which I need not refer, being taken into account in defining the position of a doubtful estate.

Of a house, with or without land, the owner may dispose as he pleases, but a written lease is obligatory; the presumption in default of such, after six months undisturbed occupation, being that the lease is on two lives. When the last-named species of lease is granted, the relations of landlord and tenant are almost identical with those already described under the "Fœste" law as applied to peasants' farms. Services of work may not be stipulated in the lease: but as a separate arrangement, unconnected with the rent, and if not undertaken for more than a year at a time, they are lawful.

If a "Huusmand" who has a lease on lives neglects to pay his rent, or otherwise commits a breach of his contract (see under "Böndergods") he may be warned to quit on any 1st of May after six months' notice given. If he refuses to leave he may be evicted by the police, having a right of action for damages against the landlord with a claim for a trial. A "Huusmand" who is a tenant-at-will must have six months' warning before the 1st of May; tenants-at-will, and for years, have no claim to a free trial in case of law proceedings.

Land may also be held in "Arvefœste," or hereditary tenure, of which relation there are two species:—

1. "Arvefœste" simple, where the lease is to the tenant and his heirs for ever, in return for a quit-rent, the estate escheating to the owner on failure of tenant's heirs.

* These legal provisions have very little practical application. A great landholder told me that he had once heard of a "Fœster" being evicted, and that he himself had turned out one labourer, or "Huusmand," with the Magistrate's help. Of this more hereafter.

† These provisions for compensation seem fair and practical, but owing to the length of the lease and other causes which will be duly stated, they are more interesting on paper than valuable in use.

2. "Arvefœste," with right to sell and mortgage. This tenure seems to be like that of the so-called "tenant-right" estates of our border country. The landlord is a perpetual rent-charger, receiving an annual payment of grain, and a certain relief whenever the ground passes to a new owner.

The second of these kinds of tenure is very common. In Danish discussions it is always assumed to be equivalent to fee-simple, a fact which should be borne in mind.*

(B.)—*Sub-Division and Accumulation.*

No estate in Denmark, large or small, can be parcelled without permission from the Minister of the Interior. The strict rule is, that when a "Gaard" is broken up there must be reserved one lot of at least 25 acres of first-class land. Farms of less than 25 acres may not be subdivided, except under very special circumstances; one lot of 10 to 12 acres must always be reserved. When demesne is subdivided, there must be told off for separate sale or occupation, as many lots of 80 acres as the feudal owner owed knight-horses for military service. For building, lots of 2 acres may be detached from an estate, and any lot, however small, may be cut from a farm when the intention is to cede it to the owner of a contiguous property, or to annex it to a house which has no land. Before a motion for the so-called "Udstykning" can be lodged at all, a number of formalities have to be gone through, amongst which I may notice the preparation of a map of the ground to show the exact nature of the division proposed. This is insisted on as a precaution against the parcelling being done in strips, and to ensure a division into squares or other suitable shapes of ground.

It should be unnecessary to remark that these rules do not bear on the life-leasehold farm. Neither do they apply to the "Housemen," whose small lots may, in a general way, be subdivided *ad libitum*.

As the requisite formalities are rather expensive, their existence acts as a slight check on subdivision. The right of accumulation is at present so free that it may be described as unlimited.

(C.)—*Registry and Reading of Deeds.*

Since local lawyers point with reasonable pride to their system of registering and reading, as a model which the legislators of other countries might copy with advantage, I shall briefly trace the history of a Danish contract. There can be no complete seisin of lands without a deed of sale or gift. Such deed must contain an exact description of the property, its place in the Cadastre, its rate in "Hardcorn," the price paid, or, if there be no sale, its computed value. The deed is delivered by the buyer to the Under Sub-Prefect of the district, who verifies the text, asks for proof that taxation is not in arrear, and calls for payment of the Court's charges. This official reads the deed in open Court, at the next weekly session, *in extensò* or otherwise; makes entry in the Court's journal that such a deed was read on that day, and certifies the same on the document. The paper is then copied into the Protocol of Deeds and Mortgages, and noted in the Register of real property. For every district in Denmark there is kept a threefold register of all estates, large and small, belonging thereto. The 1st Division gives the size, place, &c.; the 2nd is historical, showing changes of ownership; the 3rd gives the mortgages on the estate, with statement of any other circumstances that may affect proprietary rights; and references to every instance when the property has been the subject of a "Thing-lœsning,"† or Court-reading.

To those whom it may concern, the Clerk of the Court delivers, on demand, written attestations on the matters relative to the contents of the register, so that intending purchasers or mortgagees are completely protected against risks arising from imperfect information. The whole process of registry and conveyance costs from 1 to 3 per cent. on the purchase-money.

This system can be traced back to a law of 1550. It applies to every sort of contract, and by its use Denmark is saved from those permanent certainties of swindling

* "Arvefœste" of the second species seems to me to resemble the Roman Emphyteusis; but the Danish "Emphyteuta" has absolute power to alienate. The Danish system may also be compared with Sir Arthur Chichester's settlement of the Plantation of Ulster.

† "Thing" is any assembly, judicial or political. Saxo Grammaticus translates "concio."

and collapse which characterize British commercial civilization. A small newspaper devoted to the "Thinglœsning" publishes, at regular intervals, a record of the contracts registered and read throughout the kingdom, so that the progress of speculative enterprise is easily watched and measured.*

(D.)—*Inheritance and Bequest.*

The fundamental principle to be noticed under this head is:—

That a testator may, in general, dispose of one-third of his entire property, real or personal, the remainder being of necessity distributed in equal portions to the heirs, male and female, of his body.† This rule secures to each heir two-thirds, for certain, of the lot due to him as *ab intestato*, the division, where there is no will, being in equal shares.

If the Danish law has done so much for the creation of peasant freeholds, it has also recognized as a desirable object that large estates be kept in single hands, and in the families of their original possessors. The owner of an unentailed "Sœdegaard" may leave half his property to any one of his heirs, in which case he can freely dispose of one-fourth (indeed, of one-third) of the rest of his estate, the remaining three-fourths following the common rule of inheritance. But the favoured heir must, nevertheless, give the other claimants compensation for their shares reckoned on the usual foot. Again, if the proprietor of a "Sœdegaard" die intestate, the sons may reserve his real estate, on condition that they give their sisters, if any, full money compensation for the land of which the brothers have deprived them. In the Island of Bornholm a singular customary law of inheritance prevails. The youngest son, on compensating the other children, may take the estate.

The owner of a freehold "Böndergaard," be he of the peasant class or not, may leave his property according to a special set of rules, from which I am content to extract the chief circumstances. These are—

1. If a "Bonde" have no heirs of his body he may leave his estate (animals, tools, &c., inclusive) away as he pleases.
2. He may leave all to any one of his heirs without restriction as to sex.
3. He may fix the compensation to be given by the favoured individual to the deprived heirs.
4. A testator who favours a single heir (rule 2) can only bequeath, *ad libitum*, one-eighth of his entire property, real estate included.
5. The owner of two or more farms may not make a cumulative bequest.

These provisions are crossed by checks and counter-checks connected with the wife's right to control her husband's testamentary dispositions in cases of communion of property. But into such details, lying as they do *inter apices juris*, I do not presume to enter.

The last-named rules of bequest apply likewise to owners in base freehold, viz., to the "Arvefœstere," whose tenure was recently described.

Part II.—Agricultural.

[For Tables of acreage, crops, animals, &c., see Appendix.]

Although Denmark has some time since emerged from the mediæval, or three-field, system of cultivating arable land, the tillage is still too uniform in character to convey the idea of a high pitch of agrarian civilization. Culture is not everywhere monotonously the same; but a rotation of crops closely approximating to that known as "the Holstein" is very commonly followed. This method, with or without modifications borrowed from English or Scottish practice, will be found in vigour on the great manorial farms, on the peasant properties, and even on the labourers' small holdings. The land is divided into several marks, or parts, each of which is separately tilled according to a certain cycle. To give reality to my description, I shall state the plan followed on a large freehold farm in

* "Thing-lœsning" is not necessary to make a lease binding on the contracting parties, but it is essential as against the rights of a third party. A deed which has been read extinguishes a deed which has not been read.

† Children of a deceased son or daughter take the parent's share.

Zealand, where I took down the details from the peasant's mouth. The estate was of 125 acres, of which 95 acres were cultivated in seven marks after this rotation :—

1st year .. Rye (twice manured).	5th year .. Oats.
2nd „ .. Barley.	6th „ .. Clover.
3rd „ .. Potatoes and turnips (manured).	7th „ .. Clover and half fallow.
4th „ .. Barley.	

On the remaining 30 acres, which were inferior soil, the rotation was different :—

1st year .. Oats.	5th year .. Barley.
2nd „ .. Fallow.	6th „ .. Clover.
3rd „ .. Rye.	7th „ .. Clover.
4th „ .. Potatoes and turnips.	

As there were some exceptional circumstances connected with this farm, I add two other average specimens of Danish rotations—the first (and worst) being for six years, the second for nine years :—

1.

1st year .. Fallow.	4th year .. Oats.
2nd „ .. Winter corn.	5th „ .. Clover.
3rd „ .. Barley.	6th „ .. Grass.

2.

1st year .. Fallow.	5th year .. Barley.
2nd „ .. Winter corn.	6th „ .. Clover.
3rd „ .. Barley.	7th „ .. Grass.
4th „ .. ⅓ peas, ⅓ beans, ⅓ vetches (all manured).	8th „ .. Grass.
	9th „ .. Oats.

The Danish farmer is too fond of a stereotyped rotation, and the fallow is generally excessive. The fine season in spring and autumn is so short here that it is often difficult to prepare the ground properly when crop immediately succeeds crop. But, in face of the increased value of land, and its improved condition, the amount of fallow ought to be on the decrease, whereas it appears that the quantity taken from the arable is now often one-sixth, instead of one-ninth, as formerly.

Jutland is the chief grazing country: on the islands, which have a drier and warmer climate than the peninsula, the culture of cereals predominates. There are generally two successive marks of grass: the first year is of red clover, the second year will be chiefly of the various grasses sown with the clover. The clover is often short and thin, from its too frequent occurrence in the rotation, and from the ground being insufficiently manured. From the abuse of clover and the shortness of the rotations, it frequently happens that an acre of land will only yield two loads of hay.

The management of cereals is on a fair footing. Danish wheat, especially that of Lolland and Moen, is said to contain more gluten than English wheat; and in England the Danish grain sometimes fetches, *cæteris paribus*, a higher price than our own. The barley is not quite so good as the wheat: it is cut too early, and the grains are not round and full enough.*

The general defects of Danish farming, besides those already named, may be as follows:—

There is a want of due recurrence of leguminous crops; potatoes, turnips, carrots, beetroot, rape, hops, hemp, and other plants used in industry are far too much neglected; the ground is insufficiently cleaned; sowing is not done in rows. The natural manure of the farm, solid and liquid, is very generally wasted. Marling is practised everywhere, but artificial manures are less used than they should be. As a sample of their scale of consumption, I may mention that in 1868 the farmers of Jutland took 2,500 tons of phosphates (the salt preferred in the peninsula). A society is now being formed there for the importation of phosphates from England on a large scale. Not more than one-twenty-fifth part of the land under cultivation has been drained. Of the draining done a considerable part is ill-executed, both as regards depth and general plan.

* The ordinary yield of wheat per acre is said to be 28 bushels, which is about the English average. Wheat is said to return 10 fold; rye, 10 to 11 fold on islands, 6 to 7 fold in Jutland; barley, 10 to 12 fold; oats, 6 to 10 fold; leguminosæ, 6 fold; potatoes, 80 to 130 sacks per acre; turnips, 450 to 700 cwts.; clover, 40 to 48 cwts. The weight conditions of Danish grain were, for the harvest of 1869, as follows:—Wheat, 66 lbs. English; barley, 59 lbs.; rye, 62 lbs.; oats, 44 lbs.

Steam-engines do not exist except on the great manorial farms. Travelling engines are let on hire near some of the larger towns. The only agricultural machines (horse or hand) in common use are the chaff-cutter, the dressing, the sowing, and the winnowing machines. Threshing-machines are not common; reaping-machines very rare; mowing-machines, drills, draining-ploughs, are almost, if not absolutely, unknown. There is in all Denmark one steam-plough. The swing-plough (often drawn in Jutland by oxen) is used everywhere, also the Swedish harrow.

Amongst the peasant farmers, who, as I cannot too emphatically explain, are the grand productive force of Denmark (as far as quantities are concerned), there is a good deal of prejudice against machinery: the thresher, *e.g.*, being supposed to spoil the straw. A peasant candidate for a seat in the Second Chamber lately used Luddite language, declaring that he was in favour of laying a tax on machines.

Many machines are made in Denmark (at Copenhagen, Horsens, &c.) after English and American models. Competent Danish authorities assert that the country is more advanced than Germany in respect of machines, while they grant a certain backwardness in comparison with Sweden. The badness of the carts used in Denmark at once strikes the least observant eye.

The horned cattle of Denmark are of two distinct races. The Jutland breed gives good butchers' meat. These beasts are the descendants of the ancient cattle of Scandinavia; they are short-legged and have a piebald hide. The Angle (in the parlance of English buyers, the Holstein) breed approximates to the shorthorn type. These last are brown or roan beasts, which, in their own country, have a scraggy, starved look. But they are capital milkers; as the Danish proverb goes—"Angle cow gives her last fibre to the milk-pail."

In Denmark the manorial farm is always a centre of agricultural civilization.* The peasant very often profits by the bulls of the "Hovedgaard;" good judges declare, however, that the breeding is seldom well managed as far as regards selection. The cow has her first calf in the second or third year, not before November or December, and not later than February. The period named also follows from the general conditions of Danish culture: Cattle are seven months in stall; in the field from the 15th May to the 15th October (about.) There is no stall-feeding in summer. In the stall the cow may get from 3 to 6 lbs. Danish (one-tenth more than our measure) of barley and oats per diem, 1 to 2 lbs. oil-cake (for fattening, 4 to 6 lbs.), 30 to 50 lbs. of mangold, 8 to 10 lbs. of hay. There is a tendency to overdo the grain, and to give too little oil-cake. The cultivation of rape has fluctuated of late, but the import of oil-cake is increasing; green fodder is deficient. The art of fattening is ill-understood. Danish attention and capital is more and more being drawn to cattle and dairy produce.† The stalls are nearly on the Dutch plan, but have not the luxurious and clean refinements of Holland. The average "Bonde" farm of 60 acres would have twenty cows and calves, two-thirds of them giving milk. Reckoning by weight, as the more exact method, the annual yield of milk of the peasant's cow may be from 3,000 to 4,000 lbs.‡ The larger manorial farms may have 200 cows, whose produce would be at per cow from 5,000 to 6,000 lbs., say 160 to 200 lbs. of butter. Many of the manorial dairies are fitted with all the most approved appurtenances, including steam-churns, &c. In them weights, measures, tests, and thermometers are freely used. Further, the statistics of each cow are every day chalked on a board which hangs in the stall. It is objected to the Danish dairy practice that the milk is poured into too shallow pans; that the cellars are ill-ventilated and lighted; that the milk is imperfectly cooled. Cream and butter (I do not say in Copenhagen, but as got in a country-house) are both excellent; yet the butter of our Guernseys has no Danish equivalent. The cheese is made from skim milk, and is no better than the common Dutch Frison cheese. Some large proprietors make Gruyère cheese; and I have heard of an enterprising dairy-woman going to England to learn the arts of Chester and Cheddar. In this connection it remains to remark, that the cattle exported from Denmark to England are lean or half fattened. Resident foreigners find great fault with the Copenhagen meat. Their complaints are well-founded, but the butchers declare that there is no regular demand here for a first-rate article.

Of the Danish sheep-farming not much need be said. On some "Hovedgaard" farms there may be flocks of 500 to 600 merinos. The peasant will almost always have a few

* As a single symptom of this fact I may mention that "Herregaard Smor," *i. e.*, manorial butter, fetches a higher price than peasant's butter.

† See, in Appendix, Table showing diminishing export of cereals.

‡ All butter produced was calculated in 1866 to be from 50,000,000 to 51,000,000 lbs.

From want of attention to the imports as well as the exports exaggerated notions have been passed into currency about Denmark's surplus of animals and butter. (See Table in Appendix.)

sheep of the local breed, which has a cross of the Leicester. On good land the number would be five or six for an average farm of 60 acres; on bad land, 20 or 30. Fineness of wool is less studied than quantity. Mutton is not in fashion for the table. The Danish sheep, like the cow, is tied to a post before the harvest, and afterwards runs free; he is generally a poor neglected animal. In the islands the lambs are as numerous as the sheep: in Jutland only half as numerous.

The horses of Denmark are of a very common description. They are heavy and slow, and altogether inferior to such breeds as Suffolk, Clydesdale, and Percheron. The crossings are injudiciously performed.

Of lower animals I need take no account. The pigs alone are of a certain importance, smoked and salted pork being the meat in daily use with the agricultural classes.

Returning to the culture of the ground, it must be observed that the arts of garden industry have yet to be learned in Denmark. The vegetables, fruit (except apples), and flowers, the kingdom is a long way behind. The spade is generally neglected. The "Huvsmand" tries to farm his small holding as if it were a great manor farm, instead of growing tobacco, hops, rape, &c., and useful roots. Here, if anywhere, is the plague spot of Danish tillage.*

The advocates of production on the grand scale may derive many arguments for their views from the case of Denmark. Except in a very few special instances none but the large manors inspire comparisons with superior farms elsewhere. On these alone is the business of agriculture transacted with adequate means, intelligence and zeal. The superficial observation of travellers has sometimes fancied likenesses between Denmark and England. But the circumstances and aspect of the two countries, their social and intellectual characteristics, are, in truth, utterly dissimilar. Danish types of things and persons differ *toto cœlo* from English types, so that the same scale will not measure both: it is only in a loose way that a Danish manor can be compared with a first-rate English farm. There are 1,750 manorial farms and "Avlsgaarde," which, however, only make up one-eighth of the kingdom's hard-corn. Their average size is 370 acres: 500 of them have an average area of 400 acres each, the farms on the islands being larger than those of Jutland. The "Hovedgaard" is always farmed as a whole. The cultivator is either the owner, or a gentleman farmer belonging to the upper classes of society. The lease is usually for as many years as the land is divided into marks, the average numbers being, say nine or twelve; for seven marks, the lease, however, would be for fourteen years. All the relations of landlord and tenant are governed by the lease, which is always minutely particular as to the manner of cultivation, terms of payment, &c. There is no "Indfœstning" or deposit, but the landlord generally expects to receive, or to have guaranteed to him, a sum of caution-money equal to one or two years' rent. The cost of improvements is generally met jointly by owner and occupier. Quarrels between owner and tenant may occasionally arise, but such cases, when serious, are often settled in Denmark by the farmer finding a substitute who takes his place. Subletting, as already explained, is not legal, unless by agreement. Good manorial land is rented at from 18*s.* to 1*l.* 5*s.* an acre; the selling value would be, per acre, from 23*l.* to 35*l.* A net profit of 3 per cent. would be thought handsome, but few amateurs could reach that figure.

Important though the manor be as an influence and example, the "Böndegaard" is the characteristic farm of the country. The peasant's farms, freehold or leasehold, may be compared for area with the farms of the west coast of England, its average size being 60 to 70 acres. There are 70,000 of them, of which nine-tenths are of the new freehold category, the whole making up three-fourths of the Kingdom's "Hard corn." One Danish "Böndergaard," or peasant's farm, is, as I imagine, very like another, be the tenure leasehold or freehold: it would be unsafe to say that in Denmark the "magic of property," to borrow the classical phrase of Arthur Young, "has turned gardens into deserts." There is always the same single-storied quadrangle, one side of which is formed by a brick house with roof of straw or sedge. The barns and granaries are extensive and good; the outhouses, stables, stalls, &c., are often dingy and dirty. The house has from four to six low uncarpeted rooms, a kitchen, and provision cellars. The furniture is of cheap mahogany; the walls may be papered, and ornamented with an occasional engraving or lithograph; the glass and crockery are of a fair sort. The universal use of iron stoves

* There are, so to speak, no forests in Denmark, and the wood used for fuel is mostly imported. Timber has been, and still is hitherto neglected. The law forbids the buyer of a forest to cut down trees for sale until ten years have elapsed from the date of his purchase. The pine is a mere geological tree, and is no longer indigenous; it was succeeded by the oak, which again gave way to the beech. The Danish hedge is an immense bank, with poplars sometimes growing on the top. Mere fences are not approved. Commons have almost entirely disappeared.

instead of fireplaces gives the rooms a dreary look to an English eye; there is small luxury or comfort within, nothing picturesque, smiling, or trim without. The average farmer may own from 8 to 10 horses, a few sheep, and 20 cows (cost 7*l.* to 8*l.* a head); the implements have been mentioned above. His food is meat soup, rye bread, common vegetables, and smoked salt pork (the Danish equivalent of bacon), beer, the brandy of the country, and, when he lives near the sea-coast, fish. The farmer may have one unmarried servant of from 25 to 30 years of age, a boy of 15, two women servants, employing besides one "Huusmand," or labourer, who lives at his own home. When the labourers are fed by the farmer, their fare is generally the same as his; on the smaller farms, labourers, servants, and farmer sit down to table together. The fish would be in change for pork; two glasses of brandy are allowed; the maximum wages for the men servants would be from 5*l.* to 6*l.* a year.

In the "gaard" of one of the small freeholds I found a pianoforte, upon which the daughters of the house played in creditable style; but this circumstance, so I was told, might be considered quite extraordinary. I was taken to visit (and missed) a learned tenant farmer who has formed a valuable collection of the relics of the stone age; but the Danish "bonde" does not often study the conjectural archæology of pre-historic Scandinavia. An average English farmer would utterly disdain the house, food, clothes, and husbandry of the simpler Danish peasant, who, in his turn, would despise our countryman for his feudal notions, and for his dependence on a landlord's will. The "bonde" (as will be seen in detail below) is an advanced politician, respectable, and upright, being, as a rule, not indisposed to religious impressions and practice, and on the whole moulded in a more substantial, characteristic stamp than the Danish townsman. The Danish "bonde" is prudent in marriage, and does not take a wife until he expects to be able to support her. The freeholder often leaves his land to his daughter, a practice fertile of matrimonial speculations to which the peasantry are so prone. The heir would probably have to give a mortgage on the farm, in order to raise the portions due to brothers and sisters. There are in Denmark four societies of the "Crédit Foncier" class, and the local savings' banks also lend money on mortgage. The rule of the credit societies is to lend half the full value of the property at 4 per cent. for interest, with 1*s.* 8*d.* per cent. for expenses, and 7*s.* 8*d.* for sinking fund. But the advance is in the societies' paper, which at present stands at from 10 to 15 below par (100). The savings banks' rate is abont 4 per cent. on deposits, and 4 per cent. is charged for money lent on mortgage. Speaking generally, that part of the land of the Kingdom which can be hypothecated is mortgaged up to 40 per cent. of the value. Many life tenants on becoming freeholders have paid down one-third of the price of the farm, giving the seller a mortgage on the land for the remainder, the rate being commonly 4 per cent. According to the usury law, which is generally evaded, 4 per cent. is the highest interest allowed on real property mortgages.

The official statistics of emigration are very incomplete. The best authorities vaguely assert that the younger sons of peasants are often disposed to leave the country if they can take with them a capital of 1,000 dollars, or 112*l.* This tendency is variously ascribed to the high price of small lots of land, and to the spirit of enterprise. The emigration of the "huusmand" class, which is said to be growing more frequent, may be the result of their unsatisfactory, or, as some authorities say, their deteriorated position.*

The laws affecting leases, improvements, and evictions have been duly analyzed. The question of the forfeiture of leases has had no practical importance for the last twenty years. The life tenants are now well off, and they are besides grown too strong for the landlords. The law of improvements, so large on paper, is much narrowed in practice. For the tenure amounts to a lease for fifty or sixty years, the claim for compensation lapsing after thirty or ten years, according as the improvement is great or small. Then the tenant is generally succeeded by a relation, in which case, of course, no compensation would be demanded.

The permission to sell life leases by auction is of no value to the landlord, who is compelled by usage to let his farms to the children, or other relations of the last occupier. This limits his power of raising the rent, which nevertheless has been rapidly rising of late years. Owing to the division of the rent into "Indfœstning," money "Gilde," and payments in kind, it is impossible to give even an approximate notion of its rate: the deposit may vary from one-third to one-fifteenth of the value of the "Gaard."

* The emigration returns for last year give the emigrants from Copenhagen at 511, from Denmark at 3,848, all for the United States. For the purposes of this Report these figures (and no others can be obtained) are useless.

The nett return from a well managed peasant farm of 60 acres ought to be 5 or 6 per cent. The general and local taxation on the land amounts to about 3*s.* 2*d.* an acre.*

The new freeholder does not let his land. He is allowed to do so, but twenty years must elapse from the date of his purchase before he may grant a lease otherwise than according to the "Fœste" system. That period passed he would lease his farm in the way usual for manors.

It has been explained in the first chapter that the law of Denmark withholds the name and quality of "Bonde" or peasant, from all proprietors or occupiers of land whose holdings are of less than about 10 acres; that in practice it is hard to trace the frontier line between the "Bonde" and the "Huusmand," who is the tenant or owner of a house with or without land attached. There may be 137,000 of these housemen, of whom nearly one-half have, on an average, 4 or 5 acres of land, one-quarter lots of less than an acre, the rest having mere fractions of soil, or none at all. The holdings are often less important than they look on paper, for some of them, especially in Jutland, may be uncultivated ground. At the top of the stratum of Housemen are a few who, being employed in fishing, or otherwise driving an accessory business as carpenters, coopers, blacksmiths, &c., approach the position of a "Bonde" of the poorer sort. But the "Hunsmand" is, on the whole, if a freeholder, the equivalent of the ordinary Prussian peasant, if a leaseholder the equivalent, in spite of his land, of the English day labourer. He can very seldom subsist on the produce of his holding, and has to work for hire; 25 acres being, I imagine, the minimum of land here sufficient to support a family. Two-thirds of the housemen are freeholders, the rest being tenants on two lives or at will. The freeholders are rather more prosperous than the leaseholders. The houseman marries young and has a larger family than the peasant. Where his labour is remunerated by a money payment alone, his wages range from 3 to 4 marks a day, say 7*s.* 6*d.* to 10*s.* a week. This last is perhaps an exceptional figure. When the employer provides the food, the wages may run from 2*s.* 6*d.* to 5*s.* a week. At harvest, beer and brandy are given extra; sometimes a house is taken instead of part of the money wages. Danish peasant women are unwilling to work out of doors, but they may help at harvest time, also occasionally in weeding and other light work; their wages would be two-thirds of what is paid to men. The work time is twelve or thirteen hours in the summer, and in winter as long as daylight lasts. Boys begin to work when they are ten. At that age they look after sheep and geese getting food; and, perhaps, some clothing in return. Girls do not work until after their confirmation, viz., at fourteen and fifteen; they also mind geese, &c.

Allowing for differences of type I cannot say that the houseman is much worse fed than the Somersetshire labourer, although wheaten bread and bacon must, in themselves, be better victuals than rye bread and cold salt pork. The Dane has very fair bedding: in the winter the women spin: here and there a houseman has a loom which may weave linen and other stuffs for the villagers. Some of these domestic manufactures are of good quality, but the process is of doubtful economic advantage. The Danish rustic is far worse clothed than the Englishman, and above all far worse housed. Iron stoves are universally used; they warm a small room quickly and cheaply, but their heat is stifling and stupefying. The lamentations raised amongst ourselves over the Somersetshire† and Dorsetshire labourer are in all points analogous to the lamentations raised here. There is, however, this important point to be noted, that Denmark has no Yorkshire or Cumberland, political philanthropy having, besides, hitherto much neglected the labourers' question. I must add that a certain sanitary difficulty is solved here in a very archaic fashion. Housemen, yeomen, and servants are persistently guilty of the offence against which Moses so emphatically warned the chosen people.‡

The average houseman (5 acres of land) has a cow, with two or three pigs and sheep. As he persists in practising the grand culture, he has to arrange with a neighbouring farmer for the hire of horses, the price being taken out in labour. Although the houseman is of necessity a poorer and humbler man than the peasant farmer or freeholder, the social separation of the two classes is not very palpable. A houseman may marry the daughter of a "Bonde," the best of proofs that the spirit of caste does not much tyrannise over the rustics of Denmark. But this state of things will hardly continue now that the peasantry

* About 22*l.* per acre is a good, 30*l.* a high, price for free peasant land. But a farm was lately sold in Jutland for 100*l.* an acre; and for small pieces of ground double that price may have occasionally been given.

† I compare with Somersetshire, which county I know, as representing the nadir of English agrarian civilization. A very competent judge here, to whom I lent a Somersetshire newspaper which contained an article on the local "labourers' question," remarked that the whole description was applicable to Denmark.

‡ See Deut. xxiv, 13; and compare a passage in Goethe's "Italian Journey."

are the ruling power of the State. It is almost impossible for the houseman to emerge from the position in which he begins life, although he may occasionally obtain a seat in Parliament. The downward current, however, is perceptible enough. The sons of a "Bonde" may frequently be forced to descend to the occupations and rank of a "Huusmand."

The labourers' problem has not, till recently, much engaged the attention of Danish landlords. It is now becoming the fashion to build model cottages, to set on foot benefit societies, to organize relief funds, and otherwise to imitate the habits of English rural philanthropy. Such good work is wanted, for while the "Bonde" has been rapidly rising to prosperity or affluence, the labourer has stood still; if, indeed, he be not, as many persons allege, in worse plight than before. The charges for the relief of the agricultural poor are on the increase; the present yearly sum expended by the rural communes on this account is about 120,000*l.*, that is to say, about 2*s.* per head for the country population.*

I shall conclude this chapter by mentioning an advantage which distinguishes the Danish from the English rustic. At seven years of age the little Dane must go to the free parochial school, which he may not quit till he is fifteen, except special proficiency be shown. For the first three years there are four school days a-week in summer, and two in winter; afterwards two days only in summer. In case of unjustified absence a fine of three-farthings a time is levied on the parents or other responsible person. It is often difficult to get the elder children of the labourer to attend, especially in summer; but, on the whole, the system works well. In the country schools, the instruction embraces religion, reading, writing, arithmetic, gymnastics, and orthography; a little history, geography, and singing, is often added. The school is managed, and its expenses are defrayed, by the commune; if there are above 100 scholars, two masters must reside. The schoolhouse and its fittings may not, as a rule, come up to English notions of proper scholastic luxury, but I can personally testify that the immediate results of the teaching are excellent. A "Bonde" of the better sort will often desire to give his children a superior education. To meet this want there have lately been founded by private liberality, in recent years (1857–68), a number of popular high-schools (55 with 1,800 pupils), partly under the influence of the so-called "Grundtvigian," or congregational religious movement. The course is for two years; it includes Scandinavian history and literature, the elements of general and exact science as applicable to agriculture, besides elementary agricultural instruction. The schools are very cheap,—say about 12*l.* a session,—and, if appearances do not deceive, admirably calculated to exercise civilizing and stimulating influence over the rising generation of Denmark. As far as I can judge, the whole educational machinery of the Danish Kingdom is practically, not merely statistically, efficacious. It strikes me as no inconsiderable proof of this position, that there is on the Sound and Belts a certain spontaneous current of occasional culture. Denmark is not Germany. The things of mind are not here reserved as the mysterious appendage of an inner professional class.

Part III.—Historical.

The accounts given by native historians of the agricultural state of Denmark in the middle of the last century almost passes belief. Potatoes, clover, and several other important plants were unknown. Wheat was only cultivated on Laaland and Falster; hemp, flax, rape, and mustard, scarcely anywhere. The population was at a standstill, or on the decline. The peasants' farms had been taken wholesale into the manors for want of tenants to occupy them. The nobles were abusing their power to the utmost, especially their territorial jurisdiction, which they exercised with atrocious rigour in a kind of Court Baron, where the judges were often the lords' own footmen and coachmen. But about a hundred years ago a better state of things began. Parallel with the rise of the French Physiocrats there appeared in Denmark a School of Economists, headed by Pontoppidan, whose writings opened a way for the land reforms instituted and suggested by foreigners like Reverdil, the Bernstorfs, Stolberg,† and last, though by no means least, the enlightened and unfortunate

* Indoor relief has hitherto been the rule in Denmark; but workhouses are now being set going. Besides the regular parish relief there is generally an auxiliary system supported by voluntary contributions, which are poured into a common poor fund. The Danish law of settlement is analogous to our own.

† This Count Stolberg was brother of Goethe's travelling companion of various repute.

Struensee. In 1761 Count Stolberg counselled the emancipation of the peasant farmers of one of the Royal properties. The peasants were granted hereditary tenure on a quit-rent "Arvefœste," their "corvée" being commuted to a cash payment, an example followed on the estates of the city of Copenhagen. Soon the Crown domains were sold wholesale, partly in order to raise money for an expected war with Peter III of Russia, the farms being in some instances bought by the tenants. A law of 1769, in which I conjecturally trace the hand of Reverdil, encourages the great proprietors of the soil to sell the farms of the "Böndergods" to their occupiers. In a preamble which reads like a chapter from a political treatise by some advanced thinker of the 19th century, the legislator declares that the feeling that a man is bestowing his labour on his own land is the best spur to agricultural industry and progress. Wherefore the law grants that the enjoyment of the privileges attached to a "Sœdegaard" shall henceforth be independent of the quantity of peasant earth attached thereto, thus removing a main stumblingblock from the way of proprietors who might be disposed to sell their tenemental farms. After the fall of Struensee there occurred a short period of legislative reaction, but to the influence of Guldberg soon succeeded the enlightened endeavours of Count Reventlow and the younger Bernstorf. Under the Regency of the Crown Prince Frederic,* a complete series of land reforms was carried out. Measures were taken to do away with the intersection of properties. More Crown lands were resigned to the tenants for a quit-rent. The tie which under the name of "Stavnsbaand" bound the peasantry to the soil was abolished.† The "corvée" was defined; the tithe was lighted and adjusted; corn payments were allowed to be commuted; the housemen were furnished with small allotments. The permission of 1769, which had been withdrawn after the fall of Struensee, was renewed, and the relations of landlords and tenants were regulated afresh in the interest of the latter.

These reforms were followed by a rapid change for the better in the agrarian condition of Denmark. But relapses occurred, one between 1818 and 1826 so desperate that landed property lost more than half its value. At the same time illiberal regulations were passed. The leave to the landlords to sell farms without loss of fiscal privileges was cancelled. Large numbers of the newly-created freeholders disappeared. In 1835 was inaugurated the "Standerforfating," or Representative Constitution, according to which two Consultative Assemblies, one in Jutland, the other in Zealand, were to be regularly convoked. Farmers, both freeholders and leaseholders, got elected to the Assemblies, and the political agitation which followed penetrated downwards. Soon a certain social ferment was remarked amongst the peasants. The "Bonde's" horizon was no longer bounded by corn, cows, and horses. He was heard to talk of equal taxation, services, freeholds, and quit-rents. A newspaper edited by J. A. Hansen began to discuss all manner of agrarian questions. The feudal pretensions and extortions of the landlords were challenged at county meetings, and there were angry debates in the Assemblies. Far from declining the contest the landlords came courageously to the front; as when for instance, in the States of Roskilde twenty-three Danish noblemen and gentlemen stood up to claim the right of flogging their rustic women dependents. One nobleman warned the Estates that there would be an end of all things if a "Bonde" were allowed to catch fieldfares on his farm. Another nobleman ordered a peasant to be fined for addressing the gardener of the manor-house as "Thou." It almost seemed as if the iron collar, the wooden horse, the Spanish cape, and the rest of the engines of the mediæval rustic torture might one day be again brought into use.

But the middle ages did not revive. The peasant found allies outside their own ranks. When the Government sided with the aristocracy, and issued a circular denouncing agrarian agitators, and forbidding meetings to be held without the permission of the police, some men of the middle class came forward and organized the society of "Bondevenner," or "Peasants' Friends," whose programme was the emancipation of the peasantry from their civil disabilities. The special social character of the movement now began to disappear. What the peasants wanted was, to be treated like human beings, to have the land tax imposed on the manors, and above all, that the 30,000 leaseholders might become free-

* The son of Caroline Matilda, and afterwards King Frederic VI.

† Confining to the comparative obscurity of a note an essential historical explanation, I would remark that the Danish peasants, originally free men, and to a great extent freeholders, gradually fell into the practice of feudal "Commendation." The Danish form of this mediæval institution was called "Vornedskab," a relationship under which, by the middle of the fourteenth century, the "Bonde" had been transformed into a kind of "villein regardant." In later times it happened that owing to the oppression of the lords, and other causes, "there was not a man to till the ground," so that Denmark was covered with "latifundia." To remedy this, King Frederick IV instituted a militia (1701 and 1724), on whose rolls all peasants were inscribed, from the age of 14 to 35. By threatening the peasants with the army, the lord could drive them to take his farms: this was the so-called "Stavnsbaand."

holders of the farms which they occupied by the "Fœste" tenure. But this, it was now evident, the "Bonde" would never obtain by a mere social movement. Such reforms could only be carried by a strong political party, and accordingly to acquire political influence became the instinctive, if not the reasoned object of the "Peasants' Friends."

Already in the Constitutional Assembly of 1848; elected like the following Rigsdag, by universal suffrage, the "Bondevenner" appeared as a strong independent party. Although the peasant was not then as now, a democrat, the peasants' friend was; and the "Bondevenner," though a minority of the Rigsdag, formed a Radical left. The moderate Liberal party, formed of professors, employés, and different middle-class elements, insisted on a vigorous resistance to the German pretensions in the Danish Duchies, and were hence called "National Liberals." While the "Bondevenner," then as now, objected to a spirited foreign policy, laying more stress on the necessity of completing the business of domestic reform. But though the "National Liberals" and the Peasants' Friends were thus at issue on social and agricultural questions, something like a common feeling prevailed. The nobility had been completely set aside, and on their behoof the Danish middle class was not disposed to check its own natural sympathies for the peasants' cause. So that National-Liberals, like Orla Lehman and Bishop Mourad, warmly advocated the various articles of the "Bondevenner's" agricultural programme. In the Constitutional Assembly of 1848 the necessity of making the life-tenants into freeholders was recognized by the Cabinet of the day. In 1849 a Land Commission, named for this and general purposes, unanimously asserted the States' right to impose such a sacrifice on the landlords, but came to no distinct conclusion as to the expediency or manner of a forcible solution. In 1850 the "corvée" and the fiscal privileges of "free earth" were abolished; but the question of tenures still lay dormant. In the years next following, J. A. Hansen, B. Christensen, Tscherning, and other Peasants' Friends, introduced or provoked measures for selling to the actual tenants the remaining farms of the Crown domains, of the rich College of Sorö, of the University and City of Copenhagen, and other corporate endowments; also Bills removing the prohibition of the sale of the peasants' farms of entailed estates. Meanwhile, several attempts were made to bring about a forced solution. Bishop Mourad, backed by the eminent jurist Larsen, introduced a Bill to compel landlords to sell their farms at full compensation rates. But this, and seven other analogous projects, some of them less rigorous, fell through. Later on, Bishop Mourad, then Minister of the Interior, whose views after ten years had grown more Conservative, brought in the Bill of February 1861, which allowed proprietors of tenemental lands, freehold or entailed, who should sell nine farms to the actual tenants or their children (real, step, or adopted), to absorb into the manor, from the rest of the "Böndergods," land equivalent to one-ninth of all the new freehold property.

Between 1861 and the session of 1868–69 the question of a forced conversion may be said to have dropped. But J. A. Hansen last winter brought in a new Expropriation Bill, under which the landlord, in case he would not come to terms with the tenant, must sell, on demand, at one-third of the land's value as rated by a commission. Neither this Bill, nor one more onerous to the landlords, presented by Winther, the leader of the Jutland group of the peasant party, became law. As I write, two private, and one Cabinet, schemes of expropriation are before the Folkething. But at this point I must interrupt the narrative to explain certain circumstances collateral with the above-described legislative action, to which it mainly owes its hitherto merely permissive character.

In 1848 the political ostracism of the nobility was pretty complete, but some of them were beginning to understand the situation. Already there had been founded a society whose aim, said the programme, was "to bring together 'gentlemen' who from birth, education, position, or destiny, belong to the same sphere," to practise gymnastics, and other bodily exercises, play billiards and read newspapers. Moving in another circle of ideas, Count Frijs Frijsenburg, then quite a young man, now Prime Minister of Denmark, assisted by several influential friends, founded (in 1850) the so-called "Landowners' Society."* This society contemplated action in several directions. For instance, it opposed the ultra-national doctrines of the "Eiderdansk" Liberals, and afterwards the Scandinavian idea. But the grand object of Count Frijs and his allies was to break the neck of the agitation of the Peasants' Friends, by themselves coming forward as agrarian reformers and, in particular, with the announcement that they would promote the conversion of the tenemental farms into freeholds. By the force of example and influence, Count Frijs and his associates gave, or were believed to have given, so great an impulse to the sale of "Fœste" land that the peasant's wish for a forcible expropriation grew

* The efficacy of the Landowners' Society is an admitted fact, but I must remark that the number of farms sold between 1851 and 1868 was only equal to the number sold between 1851 and 1834.

weaker. While the middle class, seeing that the desired conversion of tenure was actually in progress, became reluctant to support measures in which some of them saw the beginnings of social revolution. In 1865 the position of the "great peasants" was so far improved that in the so-called "October Club," they were able to form a species of lukewarm alliance with a fraction of the Peasants' Friends. In this association, which was founded on the common dislike of both parties to the National Liberals—the "Professor Party," the "Placemen," the "Doctrinaires" (as their opponents also term them with rather less than the average fairness of political nicknames,)—J. A. Hansen, the most active journalistic and Parliamentary advocate of the peasant's claims, the flail of the Danish nobility, has met on friendly terms with persons of the order which he has helped to pull down. Provided with the political passports from the conservative democratic club a great landowner may occasionally, though not easily, obtain a seat in the Folkething. This curious, unstable alliance may also have helped to secure to the country a continuance of the services of Count Frijs as head of the Government. In a Folkething of 100 members the "Bondevenner" have now about nearly sixty votes, nine-tenths of the party being actually of the "Bondestand." They fall into a Jutland and an island group, each twenty (about) strong, and a "Grundtvigian" or congregationalist group. On agrarian questions the Peasants' Friends act together, but their cohesion is otherwise loose, and they have no one recognized leader. Under such circumstances the good understanding between Count Frijs and the "Small Peasants" is easily made to tell. By country meetings, lectures, and in other ways, the "October Club" may have helped the growth of better feelings between landlord and tenants. To its existence the landowner may perhaps be indebted for the comparative mildness of the Expropriation Bill just brought into the Folkething by J. A. Hansen.

The basis of this Bill is the fact that the existing legal restrictions on the tenemental farms deprives them of a portion of their proper commercial value. If a "fœste" farm and an adjacent freehold be sold together, the freehold will, *cæteris paribus*, something fetch from one-third to one-sixth more than the "fœste" farm. This is the natural result of the leasehold being subject to so many artificial restraints, and also of the circumstance that the owner cannot, in practice, sell it in open market. Mr. Hansen proposes to let all existing contracts run, but to prohibit the issue of new life leases, except to consenting tenants. Should no private arrangement be concluded between the landlord and representatives of the last tenants, the farm is to be put up to auction, one-third of the price realized being handed over to the representatives of the last tenant through the public Treasury.* Under this arrangement the landlord would be permitted to buy the land, which would then be at his disposal as a separate freehold, though not for absorption into the manor. Comparing Mr. Hansen's actual measure with previous schemes, or, for instance, with Bishop Mourad's first Expropriation Bill, it is evident that the landlords are now offered better terms than before. For an opening is allowed them to make the tenemental farms their own, on payment of a fine to the peasantry, in return for the removal of the legal shackles which now obstruct their full enjoyment of proprietary rights. Exceptional cases apart, a landlord selling by the proposed auction would, in spite of the deduction of the one-third, fine, realize at least as much money as he could by a sale to-day, under the conditions imposed on him by existing law and custom. The Bill, then, is in the character of a compromise, and is as such referred by the public to the influence of the "October Club." It has already been denounced by Tscherning, one of the oldest and ablest of the "Peasants' Friends," who, from the depths of his retirement, has declared that the peasant's earth is mere "ager publicus," (the illustration is mine, not his,) which the State has hitherto allowed the landlords to administer, and which it may at any moment resume. If Aryan parallels were fashionable in Denmark, the Colonel would say that the Danish proprietor is a zemindar of the pre-Cornwallis type; in proof of which he might quote the fact, that the landlord, not the tenant, is responsible for the land-tax. Colonel Tscherning asserts that Mr. Hansen's permission to the landlords to buy in their farms is an indirect spoliation of the peasantry; and his views are probably shared by Mr. Winther, the leader of the Jutland peasants, who, separating from his colleague, has brought in a Bill of his own. Mr. Winther's Bill may be called a revival of the old Mourad scheme of expropriation, under which the landlord would get compensation, but would not be allowed to buy in his land: it is not likely to pass the Folkething, let alone the Landthing. Both measures have been crossed by a Ministerial programme, which I may briefly describe as the proposed destruction of the elaborate legal system described in the first chapter of this Report. Details apart, it corresponds in principle with Mr. Hansen's

* I only give the outlines of a long and complicated scheme. By "representatives" are meant children or other individuals to whom the tenant may have willed his interest in the farm.

scheme, but gives the landlords larger facilities for acquiring the tenemental lands, and grants general free trade in land, in opposition to the Protectionist policy of the "Peasants' Friends." This programme cuts both ways; and though not at present introduced as a positive measure, its ideas will be ventilated in the Folkething during the consideration of the Hansen and Winther Bills.

The Cabinet of Count Frijs includes several country gentlemen. He himself is, or was, the greatest landholder in the North of Europe (Russian estates excepted), and he is officially pledged to the principle of conversion. Mr. Hall, and the remains of the National-Liberal party, follow in the same line, and they will adhere to Mr. Hansen's proposals. Under these circumstances it were rash for a foreigner to assert that the projected conversion is inexpedient, or that it is undesirable to accelerate its progress by a little legislative pressure.* The English ear may at first seem to catch an echo of social revolution from the whole business; but such a prejudice should, I conceive, be cured by an impartial study of the Danish Statute Book. The tenures of Denmark are not the tenures of England. The Danish landlord is not, except as regards his demesne, the complete legal or customary master of his own. To the tenemental lands he stands, very roughly speaking, as did the zemindar to the ryot before the permanent settlement. From another point of view, the analogy between the Bengalee and the Scandinavian would be close enough. If the zemindar proprietor, or tax-gatherer, was not the mildest of masters, the Danish "Jorddrot" was, till recent times, the scourge of the peasantry. Under his parental love the Danish "bönde," now the freest, the most politically wise, the best educated, of continental yeomen, was a mere hewer of wood and drawer of water. His lot was no better than that of the most miserable ryot of Bengal.

Concluding Remarks.

On a review of the whole subject, it would seem that the reign of Christian IX, is witnessing, to use the classical phrase of Machiavelli, a return "al segno"—a return to the times of the Valdemars, when every rood had its man. The Danish peasantry, no longer "taillable et corvéable à merci et miséricorde," will soon own nearly all the soil of the Kingdom. The improvement of their moral and material condition may, in part, be ascribed to the repeal of the English duties on foreign produce, to the substitution of political liberty for the impotence of enlightened despotism, and to other causes. That the conversion of tenures has indirectly contributed to the general result may be accepted as an ascertained fact. From the systematic contradiction of reputable testimony I am, however, disposed to infer that the freeholder is not a better farmer than the leaseholder. There is no doubt whatever that, in Denmark, culture on the large scale is more advanced than culture on the small.

Postscript.

The Folkething has passed Mr. Hansen's Bill, considerably amended, by 92 votes to 1. Many members, however, only voted for it in order to facilitate its passage to the Landthing, where it will probably be buried for the present. The loss of the Bill will hardly be regretted by the "Peasants' Friends," who, if it passed, would have to invent some new popular grievance. Occupied in such a quest, it would be fortunate for Denmark if they could get up a successful cry against the monstrous armaments whose little finger is heavier than the loins of leasehold tenure.

---

* See Appendix for complete statistics of conversion. I am sorry to say that there are discrepancies in the arithmetic which I am unable to explain.

Appendix.

Table 1.—Population.

(A.)—Mass.

According to Census of 1860, less the Duchies	1,608,362
Estimated increase up to January 1, 1868	145,425
Total	1,753,787

(Say on February 1, 1870, about 1,800,000).

That is:		
Islands—Copenhagen	164,786	
Towns	123,476	
Country	692,107	
		980,369
Jutland—Towns	101,475	
Country	671,943	
		773,418
Total		1,753,787

That is, the population is at the low rate of 2,527 to the square Danish mile; but in the Islands, without Copenhagen, the rate is 3,460, or about the same as in France and North Germany.

(B.)—Pursuits.

Of 1,000 persons there are employed:—

Productive Class:	
Instruction, doctors, employés, &c.	57·75
Agriculturists	454·33
Manufactures	216·45
Commerce and marine	76·28
Workmen and others	155·71
Unproductive Class:	
Capitalists and pensioners	17·92
Others, including paupers	21·56
	1,000

Table II.—Cultivation (1866).

(A).—General.

(1 Tönde Danish = 5,776 square metres, or about $1\frac{1}{3}$ acre English.)

	Tönder Danish.
Wood	319,102
Arable of all kinds	2,023,698
Pasture, fallow, meadows, and common	2,486,518
	4,829,318
Unproductive	2,020,494
	6,849,812

(B.)—Details of Arable.

	Tönder Danish.
Wheat	95,876
Rye	414,656
Barley	546,596
Oats	660,912
Buckwheat	35,971
Leguminosæ	66,902
Potatoes	67,847
Other roots	5,532
Rape	28,264
Other commercial plants	17,658
Mixed seed	83,484
	2,023,698

The four chief cereals are seventeen-twentieths of all; the whole crop average may be 8,600,000 quarters English, valued at 9,000,000*l.* Of the whole agricultural harvest 17 per cent. may be available for exportation. We take about 800,000 quarters of cereals.

Table III.—Animals (1866).

			Head.
(A.)	Horses		352,603
	Horned beasts—Bulls	19,556	
	Oxen (2 years and over)	96,067	
	Cows	811,831	
	Young cattle under 2 years	266,407	
			1,193,861
	Sheep (thereof 63,581 rams)		1,875,052
	Swine		381,512

(B.) That is:

	Per Square Mile Danish.	To 1,000 of Population.
Horses	510	205
Cattle	1,726	695
Sheep	2,710	1,092
Swine	551	222

Of 1,000 horned beasts, there were in 1861:—

Bulls	18·8
Oxen	68·6
Cows	676·5
Calves	236·1

Table IV.

(A.)—Distribution of "Hardcorn" (1860).

(1 tönde hardcorn = 10 tönder land (roughly) = 14 acres nearly.)

Species of Estate.	Number.	Tönder Hardcorn.
Hovedgaarde and Avlsgaarde (with 160 acres and over)	1,754	50,118
Böndergaarde (peasants' farms, from 10 to 160 acres)	69,094	278,528
Houses (with 10 acres and less)	136,925	34,531
Lots taxed, but not built on		5,122

This Table shows that over three-fourths of the "Hardcorn," and, roughly speaking, of the land, belongs to the peasants' farms, and less than one-eighth to the larger properties. Of estates over 30 tönder "Hardcorn," equal to 400 acres, there are only 501 in all.

(B.)—Of the "Böndergaarde" there were in 1860:—

In freehold	54,303
In "Fœste" and heritable leases	14,791
	69,094

(C.)—The numbers of Leasehold Farms since 1835 have been as follows:—

There were in 1835	29,795
" " 1851	20,480
" " 1861	13,788
" " 1868	10,826

(D.)—Conversions of Leaseholds into Freeholds and Hereditary Leases:—

	Number.		Number.
1858	129	1863	460
1859	170	1864	286
1860	215	1865	449
1861*	421	1866	476
1862	502	1867	360

(All peasants' farms averaging (roughly) 60 acres.)

* Bishop Monrad's law passed. See text.

(E.)—Comparison of 1850 with 1868, showing number of leaseholds in each year on the different kinds of estates:—

	1850.	1868.
Domains	1,051	1
Public corporations, colleges, &c. ..	2,082	553
Entailed private	10,121	5,464
Private, not entailed	7,051	3,198
Total	20,305	9,216

(Also of 60 acres as before.)

TABLE V.—EXPORTS from Denmark after Deduction of Imports.

(1 tönde Danish = 3·8 bushels, &c.)

(A. Cereals (less imports):

	Tönder Danish.
1865–66	3,832,831
1866–67	2,940,113
1867–68	2,626,253
1868–69	1,863,811

(B.) Cattle (less imports):

	Head.
1865–66	41,424
1866–67	46,361
1867–68	37,793
1868–69	36,363

No. 18.

Vice-Admiral Harris to the Earl of Clarendon.—(*Received December* 27.)

My Lord, *The Hague, December* 24, 1869.

WITH reference to your Lordship's Circular despatch of the 26th of August last, I have the honour to transmit a Report, by Mr. Locock, Secretary to this Legation, on the Tenure of Land in the Netherlands.

I have, &c.
(Signed) E. A. J. HARRIS.

Inclosure in No. 18.

Report on the Laws and Customs affecting the Tenure of Land in the Netherlands.

The Hague, December 20, 1869.

IN the compilation of this Report I conceive that it is desirable that I should strictly observe the order of the queries proposed for my consideration, and chiefly confine myself to furnishing careful answers to all of them in succession. I shall therefore, without further preface, deal with them one by one, touching but lightly, however, and in general terms, on those which possess but a subordinate importance.

The country called the Netherlands contains a population of a little over 3,500,000, composed of Protestants and Catholics, the former predominating. It is a commercial and agricultural rather than a manufacturing country. Its rich colonial possessions and its sea-indented coasts, its fat pastures, and its light level soil, have given a direction to the energies of its inhabitants.

The system of land-tenure in the Netherlands is of a double, or rather a threefold kind. There are some lands (A) held by small proprietors, or at all events by farming proprietors; there are others (B) occupied by tenants holding from proprietors, but without the accompanying practice of sub-letting; and there are again, others (C) where

the system of tenure is closely allied to our own copyhold tenure. There are some districts where one system is far more prevalent than another, and there are other districts where the first system is to be found working side by side with the second in almost equal proportions.

(A.)—Small (or Farming) Proprietors.

(1.) The quantity of land usually held by each proprietor farmer may be said to vary generally from 50 to 100 or 125 acres, according to the Province. Of course there are many much smaller, but there are likewise others far larger. The largest proprietors of this kind are situated in Friesland, Groningen, and Zeeland, where one meets with farms of several hundred acres. The farms consist of single properties, more or less compact, and are very rarely intersected by farms belonging to other proprietors.

(2.) According to Article 896 of the Netherlands Civil Code, "the law pays no attention to the nature or origin of property in regulating its succession." The same rules, therefore, apply to the descent and division of landed property as those which regulate other kinds of property. These prescribe that if the owner die intestate, all his property, without distinction, shall be apportioned equally amongst the children or next of kin, without regard to sex or primogeniture; and that if, on the other hand, a will exists, it can only dispose of a certain portion of the estate, varying, according to the number of surviving children, from one-fourth to one-half, the remainder being equally apportioned as above. Although the law of entail is not expressly referred to in Dutch law, it is not in any way recognized or allowed.

(3.) Legal possession of property is acquired by occupation, by accession, by prescription, by legal or testamentary succession, and by delivery or execution of a legal title of transfer emanating from the person empowered to dispose of the property. The delivery of real property is effected by inserting a copy of the deed of transfer in the public registers kept for that purpose (Articles 639, 671, Civil Code). Hence it appears that real property cannot, as by French law, be acquired by the mere process of sale, exchange, &c., but that besides, and in addition to such process, there is required a separate Act, namely, an insertion of a copy of the deed of transfer in the public registers. These registers are kept by the custodians of mortgages, and contain all that concerns such matters within the jurisdiction of the district court in which they exercise their functions. Whenever the deed of transfer relates exclusively to the property transferred it is copied at full length, but when it contains matters having no reference to the property transferred it is sufficient that an authentic extract be made.

A duty of 4 per cent., with an additional fee of 8*d.*, is levied at the time of registration on all acts of award, sale, resale, transfer, retransfer, and all other civil and judicial acts effecting the transfer of landed property, except acts of exchange which are liable to a tax of only half that amount, or 2 per cent.

A fixed fee of 2*s.* 6*d.*, with 8*d.* additional, is payable on a deed of division of landed, as well as other, property, amongst co-proprietors on any legal title whatever.

Over and above this registration duty which is levied on the deeds themselves in virtue of the French Law of the 22 Frimaire, year VIII, still in force in the Netherlands, a transcription duty of $\frac{1}{2}$ per cent. is levied in virtue of the law of the 16th June, 1832, relative to the copying of all deeds of transfer or division into the public registers of domains.

(4.) The Government affords no aid either directly or indirectly towards the raising of loans upon landed property. Four or five public companies, whose special object it is to advance loans on mortgage of real property, exist in Holland, but they have no public character, and enjoy no privileges or special protection from the Government. These Crédit Foncier companies, acting as intermediaries between the proprietors and the capitalists, accept all the responsibility attaching to each particular mortgage and issue their obligations payable to bearer guaranteed by the whole of the mortgages of the company and their sinking fund.

Notwithstanding these advantages many capitalists prefer themselves to make advances directly on mortgage, either from force of previous habit or from ignorance, or from a hope of obtaining a higher rate of interest by making their own bargains. It is easy to imagine that no remote districts where access to an office of a land mortgage company is difficult, and where one or another private capitalist happens to have peculiar facilities for putting himself in communication with the farmer, studying his wants and ascertaining his means, the latter may prefer what seems to him the most natural mode of obtaining a loan.

The objects for which a proprietor farmer is tempted to effect a mortgage on his paternal estate are numerous. It may be that successive bad harvests, or losses amongst his live stock have resulted in his finding himself hard up, or he may wish to improve his farm, to add some farm buildings, to rebuild his own house, to extend the drainage, or increase his stock, or he may be ambitious of adding field to field and polder to polder either to gratify his vanity or, more likely, to provide for the time when it will have to be divided amongst his children. But I believe that one of the most frequent objects of mortgaging estates is that of promoting a too great subdivision of property on the death of its owner amongst his heirs by assigning to one or another of them his portion in other securities; this would be especially the case with regard to the portions of daughters.

(5.) It may easily be gathered from what precedes, that with the special facilities of land mortgage companies, besides plenty of private capitalists ready to lend on so good security, proprietors have not been behind hand in raising loans on their farms. Properties are very commonly mortgaged to the extent of half their value, and often above it. The total value of mortgages on real property in the Netherlands is about 40,000,000*l.* sterling, but more than a-half has been effected on terms varying from 5 to 5½ per cent., which point rather to house property, including, doubtless, farm buildings, than to the land itself. The rate of interest paid by farm property is from 4 to 5 per cent.

(6.) The law affecting mortgages in the Netherlands is so similar to the provisions of the Code Napoleon that it will be perhaps best to draw attention chiefly to those points on which it differs.

By Article 1214 of the Netherlands Civil Code, a mortgage must be effected with a notarial deed, and only by the person who has the right to dispose of the property, and every mortgage to be valid must be inscribed in the public registers appointed for that purpose. There are no exceptions to this rule, and not only are informal mortgages invalid, but legal and judicial mortgages are prohibited. It is the registrars of the deeds of transfer, who also keep the books for the registration of mortgages, and they are charged with the duty of seeing that they are in accordance with each other and with the public survey. The law accordingly requires that the estates to be mortgaged should be described in the deed of mortgage as well as in the public register, by commune, section, and number of lot on the general survey. By Article 1226, if there be more than one mortgagee of the same property, they rank according to the date of registration. Article 1223, which declares null every engagement on the part of the mortgagor authorizing the mortgagee to take possession of the property, empowers the first mortgagee to stipulate in the deed that in the event of the mortgagor failing to pay regularly the interest on the loan, the former may cause the property to be sold at public auction, and recover from the proceeds his capital with interest and expenses. But it is imperative that this stipulation be inserted in the public register. The auction takes place publicly, according to the custom of the place, and in presence of a public notary. If there are other mortgagees they must be warned of the sale not less than thirty days before it takes place, by means of a public officer sent to the address given by them in the register. In practice every deed of mortgage contains this stipulation, which is freely acted on when necessary, and is found to be in the interests of the debtor as well as of the creditor; he thereby avoids the seizure of his movable property and the odium and expense of an ejectment.

The cost attending the registration of deeds of mortgage are 2 per cent. on the amount, in addition to minor fees of 8*d.*, 1 per cent. on the amount, and 1*d.* to the copying clerk for every five lines.

(7.) There being great variety of soil in the Netherlands, varying from barren sand to rich loam and heavy clay, the nature as well as the rotation of crops vary exceedingly, and it is impossible to lay down any general rule on the subject. Oats, rye, wheat, buckwheat, rape, flax, hemp, potatoes, carrots, turnips, chicory, &c., form the principal crops, the rotation of which varies according to soil and province, and extends over periods from three to twelve years. Full information on Dutch husbandry may be found in the "Agricultural Journal," an abstract of which, already in print, appears so carefully prepared that I venture to quote a few passages from it here.

"When the sand is deep with little or no loam near the surface, it is a tedious work to bring the land into cultivation. By trenching and levelling, mixing the heavier soils with sand, by a careful addition of manure both solid and liquid, and by first sowing such plants as will grow on this barren soil, a stratum of productive soil is gradually collected. If manure cannot be had, broom is first sown. This grows on the most barren soils; in three years it is cut for fagots for the bakers and brickmakers. It has somewhat improved the soil, which is next sown with buckwheat or even with rye. After this, clover and potatoes follow; and these crops furnishing manure, improvement goes on rapidly.

Potatoes are then the first crop. Then follows rye after the land has been manured to the same extent as before. In this clover is sown in the succeeding spring. After rye comes buckwheat, without any manure; then potatoes again manured as at first; and the same rotation of crops follows. It is by this means that the character of the poor soils becomes in a few years entirely changed. Great attention is paid to the choice of seed. The quantity of seed on a given extent of land in the Netherlands is much smaller than it usually is in England. This is owing to the greater attention paid to preparing the land for receiving the seed. The surface is brought to a finer tilth by repeated harrowing with light wooden harrows. Mixed seed is sometimes sown, as a mixture of wheat and rye. The sowing of carrots amongst a growing crop is peculiar to the Netherlands."

Large numbers of cattle and sheep are reared in those parts of the country which, lying below the level of the sea, are afflicted by the presence of much water. In these districts neither hedges nor fences are to be seen; here and there a solitary gate, rising above the general level, marks the presence of a path or the entrance into a meadow. Ditches and canals, cut at regular distances and equal angles, separate the fields from each other, while answering the double purpose of drainage in winter and irrigation in summer. During the summer months the cattle fatten well on the rich grasses which grow in these meadows, but in the winter they are removed to the farmyards and fed on hay, roots, &c. November is the month for removing the cattle and sheep from the pastures, from which indeed they are often driven by the rising of the water, which at this season overflowing the ditches and canals spreads far and wide. The cattle are frequently left out till they can hardly pick their way home to the farm on dry land. Often a party of oxen or cows may be seen in their tarpaulin cloths, which afford them a certain amount of protection from the driving rain, standing in the middle of some field fortunate in the superior elevation of six inches, and gazing disconsolate on the expanse of water around them.

Dairy farming is very extensive, and is carried to great perfection in the Netherlands. In the summer the cows are milked in the fields; the milk is collected and conveyed to the dairy in large brass cans with narrow necks, in which, when full, the milk can be carried with very little shaking. In the winter the cows are removed to the cow-house, a long building, in which they stand in a double row on either side of a passage running down the middle. They stand with their heads turned towards one another. Great attention is paid to cleanliness. There is a peculiar arrangement by which the tails of the animals, useless and inconvenient appendages in a stable in winter, are hoisted up and kept suspended by means of cords connected with pullies in the roof.

The proportion between tillage and grass lands is almost exactly that of three-fourths, in other words arable land may be stated to form three-sevenths and meadow land four-sevenths of their united area. In Groningen, Zeeland, North Brabant, and Limburg, the former predominates, while in Friesland, Drenthe, Overÿsel, and North and South Holland, the latter; in Gelderland, the two are nearly balanced.

(8.) Machinery is a good deal used on the larger farms for threshing, winnowing, crushing, and such like purposes, but rarely for ploughing and reaping, though some machines for this have lately been introduced here and there. Hitherto agricultural machinery has been imported from England and America, but recently the Dutch have begun to make it for themselves.

Hired labour is an absolute necessity on almost all farms, as may be gathered from their size, but it is not in my power to give any information based on statistics as to the average number of paid labourers per acre. About 100,000 farm labourers enter the Netherlands yearly in the month of May, and remain till after the harvests have been gathered in. Now the total extent of land under cultivation in the Netherlands, inclusive of orchards and gardens, but including grass land, is 1,250,000 of English acres, so that this foreign labour would be equivalent to an addition on the average of one labourer to $12\frac{1}{2}$ acres.

Female labour is common on Dutch farms. Nearly all the wives of the peasantry, and the daughters after the age of seventeen, work in the fields, though their labour is chiefly confined to weeding, hoeing, and other light work, or engaging in gathering in the harvest.

The rate of wages varies considerably in the different provinces. In some places it is as low as 5*s.* a week, and in others, especially in the vicinity of large towns, it is twice or even three times that sum. This is the rate in summer, for in winter there is a diminution in the scale of about 1*s.* or 2*s.* a week, according to the amount, Female labour is about one-fourth less expensive than that of the men; or the difference is even less; for instance, in Gelderland the wages of the men in summer are 5*s.*, and of the women 4*s.* a week, while in winter they are respectively 4*s.*, and a little over 3*s.* a week. I have here

spoken of the labourers who house and feed themselves. Those farm servants whose special duties necessitate their living on the immediate premises of their employers, are generally engaged by the year, and being housed and fed, receive from 5*l.* to 10*l.* a-year according to the nature of their employment, and the district which they inhabit.

(9.) The actual emigration to other countries of the agricultural population is in all probability very small. Statistics show exactly to what extent the agricultural population is increased or diminished each year by departures or arrivals, but without specifying the destination of the one or the origin of the other. In the year 1867, on a rural population estimated at the close of the year at 2,446,774 souls, there were 3,315 more departures than arrivals. But it is unquestionable that this draught from the rural population (which was hardly felt with an excess of births over deaths amounting to 28,266) was in great measure attributable to the perpetual flow of population towards the towns. The excess of emigration over immigration for the whole country in the year 1867 was but 1,851 persons, and of this number it is probable that a large part belonged to the town and not the rural population.

(10.) The landed proprietors of the Netherlands engaged in the cultivation of their own farms, invariably live on those farms.

(11.) After what I have said of the average size of Dutch farms it is almost unnecessary to state that there is nothing either in the way the occupiers of these farms are housed, clothed, and fed, or in their general circumstances which calls for much commiseration; perhaps there is but little which suggests improvements. A succession of bad harvests, a blight, or a murrain may indeed occasionally be the cause of extensive losses amongst these more than peasant proprietors, but is seldom that of real suffering. By drawing on their own pecuniary resources put by for the dowry of a daughter or the portion of a younger son, by cheerful self-denial, and careful husbandry, they sooner or later succeed in making up for their losses, and going ahead again. The cattle plague was a source of untold loss to the pastoral population of Holland, whole herds were swept off by its malignant agency, and yet the empty meadows have already been retenanted, and Holland is as rich in cattle as she was before the scourge first appeared.

(12.) It is out of my power to furnish the required information regarding the numbers and rate of increase per acre of the proprietor farmers, as no special statistics regarding them as distinguished from the rural population generally, have been collected. Indeed, the farm in which information on this subject is sought leads me to infer that it contemplates a far more numerous class than that of the proprietor farmers of the Netherlands.

(13.) Public opinion in this country has not been specially directed to the condition of the proprietor farmers, or to the particular advantages or disadvantages of the system as distinguished from that of tenant farmers—a satisfactory evidence of the smooth way in which both the systems have been found to work. Complaints are unheard, nor do I believe that much cause for complaint exists. The men who direct the current of public opinion in this country are engrossed with matters, some of which, though further removed from them in point of distance, affect them more intimately than the comparative advantages of proprietor or tenant farming, on which the general opinion might not be inaccurately described as one of satisfied indifference.

(B.)—Tenants or Sub-Tenants under Landlords.

Tenure.

1. The size of farms held by tenants does not materially differ from that of farms cultivated by the persons owning them, which has been described in answer to Query A. 1.

2. The Dutch law specially relating to the tenure of land is contained in the Civil Code, book iii, c. 7, s. 4. It is identical with the regulations contained in the Code Napoleon, book iii, title 8, c. 2, s. 3, with the exception that Articles 1763, 1764, and 1775 of the French Code are omitted in the Dutch.

The law presumes that a landlord in letting out a farm does so with the object and on the understanding that it will be used and cultivated as such, and holds the tenant bound so to use and cultivate it. Accordingly, should the tenant fail to furnish it with the stock necessary for its cultivation, should he utterly neglect it, injure it, use it for purposes never intended, and generally should he fail to execute the conditions of the lease, and the landlord suffers injury thereby, the latter has the power to annul the lease and claim damages with interest.

In case of half or more than half the harvest being destroyed by some unforeseen accident or misfortune, such as hail, frost, blight, inundation, &c., and in case the loss is not compensated for by subsequent good harvests, a proportionate diminution in the rent has to be made by the landlord for that year, provided that no express stipulation to the contrary has been inserted in the lease. Compensation can only be claimed in case the crops were still standing at the time of their destruction.

The usual length of tenures varies according to district, generally being sufficient to cover the time required for one full succession or round of crops; thus, in some parts it is the custom to grant three years' leases, in others five years, in others six years, and in others twelve years.

The 1595th Article of the Civil Code forbids a tenant, without permission of the landlord, to sub-let or make over his farm to another, under penalty of annulling the lease and payment of damages, with interest, and of costs; nor is the landlord obliged, after the original lease is annulled, to recognize the sub-tenancy.

3. According to law, a tenancy may be created either by parol or by written agreement. When there is no written agreement, the lease is supposed to be for such time as is necessary for the tenant to gather all the crops from his land; thus, the lease of a meadow, orchard, or vineyard is supposed to be for one year; but the lease of a farm under a succession of crops is considered to last till the succession is completed.

If, on the expiration of a written lease, the tenant remains in possession, with the tacit consent of his landlord, a new lease is established on the same terms as before, the length of the fresh lease being determined as above.

4. It is not a habit to make an entry of leases in the public registers. It can, however, be done, and the law may be said to encourage the practice, though not prescribing it, for, if the entry be made within three months of the signing of the lease, it is effected gratis. It may be mentioned that there is an Act (Article 1917 of the Civil Code) which prescribes that agreements between two persons, affecting a third party, do not come into force till the day when they are registered or acknowledged in writing by the party affected, or till the existence of such agreements is verified by some authentic document, or when one of the persons who signed it is dead.

6. There is no law or custom whereby a tenant is considered as having a right to sell his interest in his farm, with or without consent of his landlord, except in case of leases in perpetuity, which will be described hereafter.

Rent.

1. In case of tenancies, the payment to the proprietor is made by a fixed amount, and this is almost invariably in money. "Deelhebbende Pachters," or tenants who pay rent in proportion to, or by share of, produce, are known only in a few parts of the country.

2. The amount of rent is invariably settled when the agreement is made. If this, as occasionally may happen, has been done merely by word of mouth, and no receipt for rent already paid or other proof can be produced, then, by Article 1605 of the Civil Code, the landlord must be believed on his oath, unless the tenant prefer to have the rent estimated by properly-qualified persons.

The scale of rent is arranged amicably between landlord and tenant before the latter takes possession of the land; the custom of the place, private competition, or other similar considerations naturally regulate its amount; but, in case a landlord cannot by other means come to terms with an expectant tenant, recourse is had to valuation by any competent persons. But, as in such case no lease has yet been signed, or pledge on either side given or taken, it is a purely voluntary proceeding, and offers but little occasion for dispute or the intervention of the law.

Rent is payable yearly, and, except in a few instances, not in advance. There are two dates on which payment is usually effected, namely, the 21st February or the 11th November.

I confess to having experienced some difficulty in arriving at the meaning of the term "hanging gale," as it exists in no dictionary or encyclopædia, general, legal, or commercial, to which I have had an opportunity of referring. I believe the word gale to be a contraction of the Saxon word gravel, or rent, the same which still exists in the word gavelkind, the tenure to this day in force in Kent, where land, in the event of intestacy, is distributed equally among all the sons. I have recently been given to understand that the term "hanging gale" is equivalent to a running account of rent, and is used to denote the system by which the tenant instead of paying his rent as he ought to do keeps a

running account with his landlord, the effect of which is that he is always in arrear. If this be the true meaning, then all I can say is that there is no such thing as a hanging gale in this country.

(3.) The landlord has undoubtedly an unlimited power of raising the rent on the termination of the tenant's lease, and of obtaining it provided the tenant consents to take a fresh lease on the new terms, but not otherwise. In case of non-payment of rent or other breach of covenant, including, as has been already named, leaving his farm uncultivated or putting it to a use other than that for which it was designed, the landlord, if he suffer any injury thereby, may require the annulling of the lease and obtain compensation for expenses, and damages with interest.

(4.) The form of procedure by which landlord and tenant enforce their claims does not materially differ from that prescribed by the Code Napoleon. If it is a question of recovery of rent, the landlord may have recourse to a distress on the written authority of a Magistrate. The distress is effected with the aid of an officer of justice who is empowered to resort to force should it be necessary. The power of distraining can only be employed within certain limits which do not materially differ from those observed in English law, the object being to avoid depriving the debtor of the absolute necessities of life, and reducing him to a state of destitution. Farm produce and implements and live stock are liable to be distrained. The effects seized are impounded and placed in charge of an appointed guardian till the day of public sale, which must be properly advertised. The proceeds of the sale are divided amongst the creditors as the law directs. The landlord in virtue of his lease, agreement, or contract has a prior claim to other creditors on the produce and every thing else on the farm, such as cattle, agricultural implements, &c., whether they belong to the tenant or not. (Arts. 1185, 1186, 1188, Civil Code.)

Evictions.

(1.) The form of procedure by which a landlord has it in his power to evict a refractory tenant whose lease has expired, or been cancelled in consequence of his having refused to pay rent or having otherwise infringed its provisions, is laid down in the 41st Article of Judicial Organization, and the 53rd and 122nd Articles of the Code of Civil Procedure. The landlord commences by presenting at the Magisterial or District Court, a petition for the annulling of the lease on the plea of infraction of its provisions in case it has not already expired. It is at this point that the tenant has an opportunity given him of resisting the action by producing written proofs of existing, renewed, or extended tenancy. If he fails to do so, the Court issues a writ of ejectment, specifying the time for its execution. In no case can this be delayed over one month, and, except in rare cases, where the tenant has shown some special claim to indulgence, it is put into immediate execution, very frequently on the day following its issue.

(2.) Evictions seldom occur, but there are no official statistics on the subject. The most general reasons for evictions are non-payment of rent, and refusal of the tenant to quit on the expiration of his lease.

Improvements.

(1.) Improvements (particularly buildings) are always made by the landlord, except in those special cases where the contrary is specified in the lease.

(2.) In the latter case, if the tenant were to be required to make over to the landlord the buildings and other improvements on the termination of the lease, such an important condition would certainly be specified.

(3 and 4.) Unless specially stipulated in the lease, the law gives the landlord, upon resuming possession, no legal right to the improvements made upon the farm by the tenant. On the contrary, the tenant may, on leaving his farm, remove and take with him all that he has erected at his own expense, provided only that no injury be thereby done to the property. Should the landlord forcibly attempt to prevent such removal, the tenant may appeal to the Court, which, after proper inquiry, will authorize the removal, and send police-officers to see that it is effected. The claims of the tenant are not necessarily forfeited by the mere circumstance of his having delivered up the farm.

(5.) Tenants receive no aid in raising loans for improvement of their holdings either from Government or special public companies, or banks aided by Government, or enabled by special law or charter to grant loans.

Miscellaneous.

(1.) There are no complaints of unfriendly relations between landlords and tenants. Legislative interference has therefore been unnecessary.

(2.) With regard to the manner in which tenant-farmers cultivate their farms and employ labour, and with respect to their standard of living, solvency, independence, and general circumstances and character, I cannot learn that they fall far below the average of proprietor-farmers. They are, of course a less wealthy class, inasmuch as neither the land which they occupy nor, in general, the buildings which they use, or the house in which they reside, belongs to them; but this does not prevent the observations on proprietor-farmers in the earlier part of this Report from applying equally to them.

(3.) I have no means at my disposal for ascertaining what is the annual rate of increase in the population, among tenants, as compared with that of small proprietors.

(4.) It has already been stated in answer to Query A 9, that the emigration from the whole country is but small, and that from the rural districts it is probably still smaller. It is impossible to say to what extent tenant-farmers and their children, as distinguished from the rest of the rural population, takes part in this small flow towards other countries. Statistics on this head are silent.

(5.) The extent to which public opinion has been occupied with the question of the advantages or disadvantages possessed by the system of tenant-farming over that of proprietor-farming has already been described in Answer to A 13.

(6, 7, 8, and 9.) The Legislature has never interfered in any way either for the purpose of promoting the creation of freeholds, or tenancies by proprietors, or the granting of leases, or in any other way to increase, by artificial means, the number of owners or freeholders. Public opinion having never called for any such interference on the part of the State. It has generally been found that the landed proprietors have, without pressure, consulted their own interests and those of others, by never refusing to grant long leases, and even leases in perpetuity, as in Groningen, of unreclaimed lands, to those willing to go to the expense and labour of bringing them under cultivation, while the holdings already in existence are found to adapt themselves in size to the requirements and means of the tenants. As to forcible creation of freeholds, rent is low in the Netherlands, and a tenant can obtain a lease on such terms that he seldom is tempted to look on it as a grievance that its proprietorship is denied him.

(10.) The Government gives no assistance to tenant farmers who are striving to become owners of the land which they cultivate or of other land. Correct returns of the number of such cases cannot be furnished. Tenants frequently receive assistance, however, in their endeavours to increase the size of their farms from the Land Mortgage Companies, but these have not published returns of the assistance granted by them for this particular purpose, the returns published not distinguishing in fact, so far as I have been able to ascertain, between house, farm, or other immovable property.

(11.) The law of succession requires the division in equal portions, amongst the children or next of kin, of a major part of every inheritance without regard to its nature or origin, and this is naturally calculated to favour to a very great extent the division of landed property. But on the other hand there exists a very prevalent desire with individuals to avoid unnecessarily splitting up the paternal estates. It is a common thing for a farmer, whether proprietor or tenant, to have accumulated before his death sufficient movable property, frequently in the funds, to enable him to assign a portion therefrom to one on another of his children.

(C.)—Copyhold ("Beklemrecht").

There exists in the province of Groningen a system of land tenure which resembles in some points the copyhold tenure of England. I speak of the "Beklemming" system. A history of its origin and growth would make a most interesting subject of study, but would far exceed the limits of the place which it occupies in the present Report; I must content myself therefore, at all events for the present, with giving, in as few words as I can, a general idea of the mode in which this peculiar kind of tenure has gradually grown up, and of some of the more salient points of its present character.

More than one theory has been started as to the source to which it in the first instance owes its existence, but the one which has probably met with the greatest number of supporters is that which traces it back to times anterior to the sixteenth century, and declares it sprung from the excessive landed property of the Church in those parts previous to the Reformation. According to the advocates of this theory the lands in the

possession of the monasteries were so large as to exceed the capabilities of the monks to bring them under proper cultivation. It therefore became a common practice for the monasteries to grant leases of lands which had either never within the historic period been tilled, or which had been allowed to return to their natural state. These leases were usually granted for a term of six years, and as the tenant undertook to make every improvement at his own expense, the rent was placed at an extremely low figure. Even then such terms of tenure could never have been greatly to the advantage of the cultivator, who at the end of his lease, finding he had received but a small return for the expense to which he had been put, naturally clung to the land and insisted on a renewal of the lease. Land being in those days plentiful compared to the hands available to cultivate it, the monks had to yield the point, but not until they had received a douceur, which came by habit to be looked on by both parties as a *sine quâ non* to the renewal of every lease, and was usually equal to a year's rent. On this condition the lease, which was a written one, was renewed for another period of six years; and so again time after time. As the estates let out in this manner increased in value and productiveness, the proprietors sometimes managed to obtain an increase of rent, though often this was compounded for an extraordinary present, such as on the marriage of a tenant, or when a son succeeded to the possession on the death of his father. This, too, gradually came to be looked on as a right by the proprietors, who refused to acknowledge the validity of the succession, the marriage of the tenant, or the legitimacy of the children on any other conditions. These different presents or offerings were called and still bear the name of "Geschenk." But no gratification of the kind would induce the proprietors to renew the lease except to a direct descendant of the last tenant. If, therefore, a tenant died childless the use of the farm reverted to its owner. In the same way, no tenant could sell his right of tenancy, or "Beklemrecht" as it was called, to another. Neither was it allowed to divide a farm amongst the children of a deceased tenant. On this point the proprietors were inexorable; they sought ease and simplicity above all things; they had no wish to have to do with half-a-dozen tenants instead of one; there was but one original lease, and whatever private family arrangements might be made among the children, but one hand held the title deed, but one name was inscribed on their rent-roll, and they accordingly acknowledged but one responsible tenant.

All these restrictions clearly betoken a state of things in which, on the one side, there was the farmer a *de facto* holder for himself and his direct heirs in perpetuity of an estate in which he had deep interest, and at a rent below what it was worth, but on a title which he knew to be faulty; and on the other side, the proprietor conscious of his weakness, unable to evict his tenant, and glad to compound with him for an occasional small rise in rent and a more frequent and regular gratification.

Then came the Reformation, and with it the suppression of the monasteries, the dispersion of their occupants, and the confiscation of their possessions to the State, which in those days was the province. The province thus found itself the legal possessor of immense estates producing but a limited revenue, and held by a class of men who had long ago learned to look on themselves as irremovable. But the State was stronger than the Church had proved itself. There was a single "Rentmeester" charged with the administration of the domains, to whom all petitions and memorials on the part of the "Beklemde Meijers," as the tenants were termed, were referred, and by whom they were adjudged on the principles most in accordance with his own views and the interests of the masters whose servant he was. Without the guidance of any laws applicable to the system, he had to give a written decision on every separate case brought before him. These decisions, or "Staatsresolutien," which are still in existence and have recently been published, were quoted and relied on in the same way as are previous judgments in English law. The Netherlands Civil Code, which was revised from the Code Napoleon in 1838, contains but one allusion to the "Beklemrecht;" it is in Article 1654, which reads thus:—"The 'Beklemrecht' and the perpetual 'Beklemrecht,' born of private agreements or established by other legal means, are regulated by the conditions in the agreements and stipulations themselves, and, in default of any such, by the customs of the place." Seldom was more formal confession of inability or reluctance to deal with a vexed question.

But to return to an earlier date. Towards the middle of the last century it was decided to alienate the provincial domains, and accordingly they were nearly entirely disposed of to individual proprietors about this time. The "Meijers" thus found themselves once more with fresh landlords, and lost no time in again trying to secure the boon they had in vain been striving during more than two centuries to obtain, that is to say, an acknowledgment on the part of the landlords that their lease was a perpetual one,

and not terminable every few years. The new proprietors on their part, reluctant to engage in lawsuits, and eager to put an end to the long-standing dispute, showed themselves in many cases ready to meet the views of their tenants. In lieu of the old leases new ones were frequently granted, containing the long-sought-for perpetuity clause, coupled with the obligation, now made one of the conditions of the lease, of the succession and marriage offerings. In many cases tenants had, however, to consent to an increase of rent. By the terms of the new leases, the holding was secured in perpetuity to the "Meijer," and after him to his lawful heirs in direct (ascending as well as descending) or collateral line. There was made this difference, however, that the lawful heirs in direct descending line paid a "Geschenk" of only one year's rent on succeeding to the tenancy, whereas other relatives were made to pay double. Similar payments had to be made on the marriage of the tenant, or, if already married, on his taking possession of the farm. In virtue of this payment the wife became a "co-Meijer" with him, and in the event of his death, had a prior claim to the tenancy to any other person, including the children. The "Meijer" had also the faculty reserved to him of disposing of his "Beklemrecht," or tenancy, in which case both the purchaser and the seller had to pay to the proprietor of the land a "Geschenk" of one year's rent. But the old rule, which prohibited the division of an estate, was strictly adhered to, and but one individual was held to be the responsible tenant.

Such were the most striking features of the new leases in perpetuity which were first granted towards the close of the last century, and which, down to the present day, are continually being substituted for the old ones. The greater portion of the farms in Groningen are now held on these terms, though there is also a large number still held under the old form of lease, in which cases all conditions of tenure not expressly defined in the lease are still determined in law according to the "Staatsresolutien." But, in point of fact, the "Meijer" holding under the old lease enjoys much the same privileges that have been formally secured by the new lease. There are few proprietors, for instance, who put themselves to the trouble now-a-days of renewing the leases every six years, except in those cases where the periodical renewal is, by the express stipulation of the lease itself, made indispensable. Even then, the accompanying "Geschenk" is no longer looked for; and rare, indeed, are the instances in which a landed proprietor, availing himself of his legal though disputed right, incurs the odium of turning off a tenant whose ancestors from time immemorial have held the farm which he still cultivates, and on which every building, ditch, sluice, fence, or other improvement has been made at his own or his predecessor's expense. It may, therefore, be stated that practically the whole of the tenant farmers of Groningen hold under interminable leases, subject to the payment of a small annual rent in addition to certain obligations on specified occasions, such as marriage or succession. So thoroughly is this the recognized custom of the Province that a proprietor desirous at the present day of disposing of land hitherto held exclusively by himself will do so on the "Beklemming" system. He will sell for a certain lump sum the "Beklemrecht" to a farmer desirous of taking the land on an interminable lease, subject to the usual conditions of rent and "Geschenk," and he will still have the proprietorship of the land, representing an income equal to 2 or 3 per cent. on its previous value, which he will now sell at a reduced price to some capitalist.

The foregoing is a light, though, I have every reason to hope, an accurate sketch of the "Beklemming" system of tenure in Groningen, which, though differing in its origin, will be recognized as bearing in its present development a considerable resemblance to the English copyholds with their quit rents and fines. Farms held under this tenure are cultivated, in most respects, as those already described as farmed by proprietor farmers. The farms themselves are not so extensive as reckoned in acres as in many other parts, for they vary from 50 to 150 acres, but the land is richer, and the farms do not often comprise woods, peat grounds, commons, and other uncultivated tracts, as they frequently do in other parts of the country.

With this, I think, I had better terminate a Report which has already exceeded the limits which I originally assigned to it, and which, being on a dry subject, ought at least to have possessed the redeeming point of brevity. I have endeavoured, not, indeed, without much kind and valuable help from others far better acquainted than myself with such details, to answer fully and to the point the several queries put to me, nor have I sought to intersperse my replies with more readable matter. The result is certainly not calculated to engage the attention of a disinterested reader. I can only hope that it may not prove utterly valueless in the opinion of those for whom I have written.

(Signed) SIDNEY LOCOCK.

No. 19.

Lord A. Loftus to the Earl of Clarendon.—(Received November 1.)

My Lord, *Berlin, October* 27, 1869.

WITH reference to your Lordship's Circular despatch of the 26th of August last, inclosing a series of questions relating to the laws and customs affecting the tenure of land in Prussia, the answers to which your Lordship directed should be embodied in a Report to be drawn up by Her Majesty's Secretary of Embassy, or failing him by the Second Secretary, I have the honour to state that, in consequence of Mr. Petre's time being so fully occupied with his official duties and with the preparation of a Report which he had already commenced on a subject connected with the condition of the artisan and industrial classes in Prussia, I charged Mr. Harriss-Gastrell to draw up a Report in accordance with your Lordship's instructions, a duty which he has already partially accomplished.

The plan which has been adopted by Mr. Harris-Gastrell is to divide his Report into five parts:—the first, Introductory; the second, a Sketch of Prussian Legislation, past and present, affecting Land; the third, relating to the Distribution, Population, and Cultivation of Land; the fourth, containing brief answers to the Questions, and giving reference to fuller information contained in other parts of the Report; the fifth, and last part, containing Results of Personal Observation and Inquiry in particular Districts.

I have now the honour to transmit to your Lordship copy of a letter from Mr. Harriss-Gastrell inclosing Parts I and II of his Report, and in doing so I beg particularly to draw your Lordship's attention to the summary which is given in Section D of Part II of the Prussian Legislation, past and present, affecting the tenure of land, with a review of its general results.

I also take this opportunity of testifying to the great industry and zeal which Mr. Gastrell has shown in collecting and sifting materials for his Report, in order to furnish Her Majesty's Government with the fullest possible information upon every point connected with so important an inquiry.

I have further the honour to inclose the copy of a despatch, dated 12th October, which I have received from Her Majesty's Consul at Königsberg forwarding replies to the queries which I transmitted to him regarding the tenure of land in East Prussia.

I have, &c.

(Signed) AUGUSTUS LOFTUS.

Inclosure 1 in No. 19.

Mr. Harriss-Gastrell to Lord A. Loftus.

My Lord, *Berlin, October* 27, 1869.

I HAVE the honour to state that I have lost no time in collecting materials for a Report upon land in Prussia, and that I am still giving my best attention to this subject, in accordance with the instructions in the Earl of Clarendon's despatch of the 26th of August last, marked Circular, to which you directed my attention.

I have also the honour to place herewith in your Lordship's hands, for transmission to the Earl of Clarendon, the first and second parts of my Report. The first part contains merely a general introduction to the whole subject; but the second part deals, I fear with much imperfection and many shortcomings, with the important subject of the National Agriculture legislation of, and the other legislation affecting land in, Prussia. The remaining parts of the Report will contain that kind of information as appertaining rather to the purely agricultural conditions than to the legislative conditions of the land question, which forms the subject of many of the questions set forth in the list of questions inclosed in the Earl of Clarendon's circular despatch.

But I hasten to place now in your hands, rather than await the termination of my inquiries into those agricultural conditions, the part which I have prepared on the legislative conditions of the land question in Prussia, inasmuch as they form a distinct portion of the investigation and as they may be of immediate use for purposes of comparison with the conditions of the land question in Ireland. Since I am personally little acquainted with that vital question of our national economy, I have preferred to restrict myself to ranging over the whole field of inquiry here, and to collecting as fully as possible within the brief time accorded every variety of information therein. I beg to observe to your Lordship, that I have interpreted the instructions of the Earl of Clarendon to mean that

the writer of this Report should endeavour to draw such a picture of the land question in Prussia, as should enable the readers of the Report to ascertain whether or not any main features or any chief or subordinate details might be profitably studied for use in Ireland. I have considered that this object would be most practically attained; first, by epitomizing the materials of the land question for the readers who shall honour my Report with perusal, and then by introducing brief summaries of the results obtained in Prussia, and by adding a few general observations on the chief points of interest. I have accordingly adopted this plan.

One word as to the outward form of my Report. As your Lordship knows, I have had comparatively little time in which to collect and condense the materials for this Report. As also your Lordship is aware, the difficulty of my task has been much increased by the necessity of reading up the subject, with all its technicalities, in a foreign language, before it could be epitomised in my own tongue. Moreover, I have neither the pen of the ready writer, nor the vocabulary of the practised writer. For these reasons I must, therefore, beg indulgence not only for any disconnection of subject, but also for any crudeness of style, and for any want of fluency in composition, which may be frequently perceptible in my Report. I must also beg indulgence for any imperfections in the treatment of, and especially any defective acquaintance with the technical language of, those numerous portions of the inquiry, of which my previous knowledge was limited to the current knowledge of daily life.

I need not assure your Lordship that I shall allow no unnecessary delay to occur in the preparation of the remaining portions of my Report.

Your Lordship will observe from the plan of my Report, as stated in the introductory paragraph, that it is my intention to append to it a list of the books and publications I have consulted. I may, however, be permitted to acknowledge here the obligations under which I am to many authors of general and technical treatises, and to state that I have freely used the official publication issued by the Prussian Government under the editorship of Dr. Meitzen on "Land and its Agricultural Relations in the Prussian Monarchy before 1866."

I have, &c.
(Signed) J. P. HARRISS-GASTRELL.

Inclosure 2 in No. 19.

Report upon Land in Prussia.

Large area of the inquiry.

1. A REPORT upon Land in a State, whose agricultural constitution is uniform and not varied, would from its wide-reaching branches cover an enormous area of inquiry. But a Report upon Land in a State like Prussia, whose agricultural constitution has been much varied and is still not uniform, must necessarily cover a yet larger area of inquiry. And not only is the area of inquiry thereby enlarged, but the difficulty of inquiry is also increased. It will therefore be desirable to examine each branch of the subject separately and with sub-divisions, in order that it may be easily seen in which branches and in which sub-divisions that difficulty of inquiry may have interfered with obtaining complete information, and in order that it may be more easily determined in which direction to prosecute subsequent inquiries on points of interest.

Plan of the Report.

2. Accordingly I propose to distribute this Report into five parts. In the first part I shall assemble some introductory observations and statistics of a general character. In the second part I shall give a sketch of the history and present state of the legislation affecting land. In the third part I shall endeavour to delineate historically and actually the agricultural conditions of land, and I shall sub-divide this part into the distribution, population, and cultivation of land. In the fourth part I shall give short answers to the list of questions with references to the paragraphs of the Report, in which the fuller information may be contained, and shall touch upon any subjects of interest which may not have been treated in any previous part of the inquiry. In the fifth and last part the results of personal observation in the Provinces will be recorded. I also purpose, instead of making frequent references to my authorities, to append to the Report a list of the books consulted. Finally, I purpose to preface the Report with a table of contents to facilitate references, and to append to it an explanation of German terms, for which a word will have been often arbitrarily selected in order to avoid the frequent repetition of several words or of a phrase which would alone render the meaning in English.

Part I.—General Introduction.

3. This is a Report upon land in Prussia, and not upon land in the North German Confederation. It is however intended in a subsequent Report to note, if time and opportunity permit, the chief points of interest in such countries—as Mecklenburg for instance—which are within, so to speak, the district of this Embassy. This is a yet more restricted Report, for it is a Report upon land in the Prussia before 1866 and not in the Prussia since 1866. It is likewise intended in a supplementary Report to record briefly the chief points of interest—and there are some of importance—in the agricultural constitutions of the newly-acquired provinces. This Report will then be a Report upon land in Prussia, including only the eight old provinces of East and West Prussia, Pomerania, Brandenburg, Posen, Silesia, Saxony, Westphalia, and the Rhine. But it will, of course, be understood that the word "Prussia" will have a varying meaning, as to the territory it includes, according to the period of her history, to which any particular part of the Report may refer. It will be used as denoting the Monarchy at the date, to which the circumstances treated of in any given part of the Report belong.

4. These preliminary remarks being made, it is necessary for marking out the area of inquiry over which this Report should extend to call to mind the general tenor of the Earl of Clarendon's circular despatch of the 26th of August last, and the general bearing of the questions inclosed therein. It will accordingly be desirable to give a general account of the Kingdom of Prussia, and to preface this account by a brief statement of the relative importance of Prussia as a State.

(A.)—The relative Importance of Prussia as a State.

5. This relative importance can be best shown by noting cursorily her political and social relations in comparison with those of other European States, of other German States, of other Zollverein States, and lastly, of other States of the North German Confederation.

(*a.*)—*In Europe.*

6. Since 1815 the proportion of absolute Monarchies in Europe has fallen from 78 per cent. to 10 per cent. Prussia, by being more or less constitutional since 1848, has assisted in diminishing the former proportion. Her Parliament is distinguishable from the Parliaments of many other States by its practical equality, and neither practical nor scarcely theoretical liberty of action. The House of Lords belongs to the small category of Upper Chambers, in which a third of the Members represent merit, and a half only of the seats are hereditary. The Lower House is distinguishable by the system of election, which consists in indirect election and in separating the electors into three classes. Prussia is distinguishable from all other States by the practice of Universal Suffrage in her Parliamentary elections, except from France, Switzerland, and Denmark, and the newly-erected Confederation of North Germany, and quite recently from Spain. It appears that 20·8 per cent. of the inhabitants are electors, but only 30 per cent. of these voted in 1867. In France and Switzerland only is the proportion of electors higher; but, with few exceptions, the proportion of voting electors is higher in other countries. In England about 9 per cent. are electors, and of these only 41 per cent. appear to vote. Prussia is one of the large majority of States, in which the proceedings of the courts are public and the institution of a jury exists. As to her political and administrative organization it is impossible to institute a comparison with other States; but, as compared with other States, Prussia must be allotted, if not a high place for the wholesome influence of that organization, at least a good place in the scale.

As to her Parliament.

As to Organization

7. In extent of territory Prussia is now seventh in rank, having since 1866 taken precedence of Great Britain. But the relative proportion of population is of far more importance than the relative extent of territory. This relative proportion is 177·8 inhabitants per square mile. Belgium and Saxony have more than double that proportion; but even amongst the eight large States she has only a middle place for density of population. On the other hand, she is peopling her territory at a faster rate than any other State except Saxony and Norway, and than any other of the eight large States. If the rate of progression of past years were continued "Prussia would," as M. Block remarks, "have nearly quadrupled her population in the 160 years it will require for France to double her population." But the rates of progression diminish as the density of population increases. The converse is however not true, for rareness of population does not necessarily increase the ratio of progression, as witness Russia. The questions grouped around this question of population are interesting for estimating the future position of Prussia amongst nations; but for the purposes of this report it has been

As to Territory;

And Population.

s to Poor.

necessary only to indicate her relative importance in territory and population amongst the European States.

8. As regards the proportion of poor persons,* which in Europe is 1 in 30, Prussia takes a middle place, for she has 1 in 34; whereas, for instance, Holland has 1 in 7, Belgium 1 in 8, Switzerland 1 in 20, and Great Britain and Germany each 1 in 22. The other countries who in this respect precede her are Saxony, Spain, Denmark, Portugal, Sweden, France, Norway, Bavaria, and Italy. Austria follows her closely, having 1 in 35. But as to the tendency to increase or decrease of the proportion of poor, Prussia's position is by the latest accessible statistics slightly unfavourable, for her proportion in 1852 was 1 in 36, whereas in 1861 it was 1 in 34. In a similar period Holland had considerably diminished her poor. The diminution which had been taking place in Great Britain was checked by the cotton famine. The statistics of the Prussian census of 1868 may show a different tendency, in spite of the famine in East Prussia.

s to Rural opulation.

9. But if there be any portion of comparative population statistics, which more than any other shows the importance of Prussia amongst other countries in connection with the question of land, it is the relative proportion of her rural and urban population. Her urban population was 30 per cent. and is now 29 per cent. France has about the same proportion, but with the exception of Austria, and of course of Russia, no other large State has so great a per-centage of rural population.

s to Finance.

10. As to the relative financial position of Prussia the first noteworthy fact is, that she alone of the great States needs only to levy in taxation a little more than one-half of her nominal expenditure. The proportions of her revenue are as follows:—From the Crown lands, Crown railroads, and other property, 44 per cent; from direct taxation, 19 per cent.; and from indirect taxation, 37 per cent. Even Russia can thus provide only 14 per cent. Consequently, as compared with other States, Prussia raises by taxation only a small portion of her revenue, and the burden of the national expenditure is thus, at any rate apparently, lighter. Whether or not she would do well to rid herself of the Crown properties is another question. The tax-payer of Prussia is also less heavily burdened than the tax-payer of most other large States, if the taxation per head be regarded, for he of Prussia pays about 16*s.*, whereas he of Great Britain pays about 41*s.*, and he of France about 27*s.* Prussia's position in respect of the aggregate public administrative expenditure will be seen from the following figures:—

s to Taxation per ead.

	Administrative Expenditure.			Total.
	In the Budget.	By Provinces.	By Communes.	
	£	£	£	£
Great Britain	86,000,000	22,000,000		108.000.000
France	72,000,000	7,000,000	28,000,000	107,000.000
Russia	65,000,000	Unknown		80,000,000 (?)
Austria	46,000,000	Unknown		70,000.000 (?)
Italy	40,000,000	25,000,000	11,000,000	76.000,000
Prussia	36,000,000	600,000	3,600.000	40.200.000

s to National)ebt.

It is therefore obvious that the subject in Prussia pays relatively less than in most large States and much less than in Great Britain and France, for the necessity and luxury of being governed and administered; and it will be recollected that the extraordinary and extraneous items included in the receipts to cover the 36,000,000*l.*, are much higher than the corresponding ones of the Budgets of other countries. As regards the proportions of direct and indirect taxation, Prussia takes a middle place, providing one-third of the necessary amount by direct and two-thirds by indirect taxation, whereas Italy makes about equal use of direct and indirect taxation, and Great Britain makes the least use of direct taxation. Last but not least in this financial comparison of Prussia with other States is the smallness of her national debt. It is a charge of scarcely over 2*s.* 9*d.* per head per annum, whereas in Great Britain it is 16*s.* 6*d.*; Italy, 14*s.*; France, 10*s.*; and in most other countries higher than in Prussia. In fact, Prussia is the only great State in so exceptional a position, and only Norway, Sweden, and Switzerland are from this point of view in a better position. From another point of view too Prussia's position in respect of her national debt is enviable. It is scarcely double her State income, whereas in Holland it is 12 times, in Great Britain nearly 9 times, in Austria 8 times, and in France 6 times the State revenue. With regard to her national credit Prussia is not so high in the scale, for in this respect Great Britain is still first, and France, as well as some smaller countries, precede Prussia. It will be interesting, in connection with this subject, and as

\s to Tax-paying apability.

* By "poor persons" are not meant paupers only, but the *poor* also whose means of subsistence are more or less precarious. "Poor persons" is used in contradistinction to the more monied classes, *i.e.*, the "rich persons" and the "well-to do persons."

showing the relative tax-paying capability of the population of the several countries, to reproduce from M. Maurice Block the following Table, which he considers to be merely approximative:—

	Average Income.	Average Taxation.	Proportion.
	Francs.	Fr. c.	Per cent.
United Kingdom	685	51 31	7·49
France	598	33 98	5·68
Prussia	455	19 24	4·23
Austria	375	15 0	4·00
Russia	161	14 91	9·26
Italy	125	19 6	15·65

As to Agriculture.

11. If the relative importance of agriculture in Prussia and other States be compared, the following Table, according to M. Block, can be constructed:—

	Agricultural Population to Total Population.	Average Returns per Hectare of Corn.	Head of Cattle per 1,000 Inhabitants.	Head of Cattle per 100 Hectares.
	Per cent.	Hectolitres.	Number.	Number.
Russia in Europe	85 to 90	16·0	693	86
Italy	77	16·0	291	249
France	51	14·6	494	346
Belgium	51	19·3	402	660
Prussia	45	19·8	540	369
Austria	25	16·0	635	307
Spain	25	16·0	316	151
Holland	16	23·0	492	539
United Kingdom	12	40·8	515	478

As to Commerce.

12. For estimating the relative importance of manufacturing industry, there are no such even approximative figures at hand as the above, but Prussia's position amongst the large States in respect of commerce can be judged from the following figures:—

	Commerce.		Commerce.		Increase.
	Year.	Millions of £	Year.	Millions of £	
					Per cent.
United Kingdom ..	1856	356	1866	534	50
France	1856	126	1866	254	100
Zollverein	1857	106	1867	153	50
Italy	1857	58	1866	60*	..
Austria	1856	56	1866	48*	..
Russia	1856	45	1865	52	15

As to Railways.

13. Before concluding this cursory comparison of Prussia with the other large States, it is desirable to note the fact that she has increased her facilities of transfer by means of railways at a relatively small expenditure and is also in this respect in a favourable position, as the following Table will show:—

	Length.	Expenditure.	Per Mile.
	Miles.	£	£
Great Britain	13,900	626,000.000	44,800
France	9,740	300,500,000	30,750
Prussia	5,615	98,300,000	14,000
Austria	4,230	70,000,000	16,500
Russia	3,790	60,000,000	16,000
Italy	3,070	80,000,000	26,500
Spain	3,050	66,000,000	21,900

As to several matters.

14. In conclusion Prussia has, in respect of the following details, a first place for increase of population in the last fifteen years; for the relative number of agricultural associations; for the increase of commerce; for the relative length of her navigable rivers; for the relative number of her primary schools, and for the number of her higher schools; and for the number of those who can read and write. But she has also a first place for the relative strength of her military forces, with their resulting loss of some 90,000,000 of days of labour. Prussia has a second place for rareness of crime; for extent of cultivated land; for relative produce in cereals; for the net returns of her agriculture; for the

* In these cases no increase can be calculated, as the extent of territory was changed.

absolute number of her agricultural associations; for the relative number of savings' banks, of depositors, and of relative amount of deposits; and for the relative number of many kinds of charitable institutions, such as hospitals, orphanages, deaf and dumb asylums, &c.

15. It will have been seen from this brief review of Prussia's position in relation to the position of other European States, that it is in many important points favourable to the development of the national wealth and to the advancement of the national weal. This relatively favourable position must not be lost sight of in trying to trace the causes of her prosperity, and must be quoted in opposition to any attempt to attribute her development during this century to this or that set of causes, even if the set of causes be the justly praised National Agriculture Legislation of Stein and Hardenberg. Three inferences can be safely made from the foregoing premises, viz.: that it is of more vital importance to Prussia than to some other States to have a sound agricultural constitution; that it is consequently probable that her necessities as well as her enlightenment will have taught her which is the soundest form of agricultural constitution; and that however much that constitution may differ from the constitution of other States, and however little it may suit the existing circumstances in another State, yet it is worthy of deeper study than can in this Report be bestowed upon it.

(b.)—In Germany.

16. In considering Prussia's position in Germany it is unnecessary at present to compare her with Austria. It will be observed also that in stating her relative importance in Germany, thus defined, her relative importance in the Zollverein will also be practically therein comprehended. The result of the wars, at the end of the last and the beginning of this century, was to deprive Germany of 570 square geographical miles and to invest her with 763 square geographical miles of territory, so that she remained with an increase of 193 square geographical miles. By the changes effected Prussia profited largely. She had in 1866, 5,070 square geographical miles out of the 9,675 square geographical miles of Germany. By the annexations of 1856 she now possesses 6,373 square geographical miles. As regards population the following Table will show Prussia's position at various dates.

As to Territory.

As to Population.

	Inhabitants.	To the square Geographical Mile.	Inhabitants.	To the square Geographical Mile.	Annual Increase.	Inhabitants.	To the square Geographical Mile.	Annual Increase.
	1816.	No.	1837.	No.	Per cent.	1858.	No.	Per cent.
Prussia	10,425,091	2,043	14,160,063	2,774	1·70	17,739,913	3,476	1·21
Bavaria	3,560,000	2,566	4,315,469	3,110	1·01	4,615,748	3,327	0·33
Saxony	1,200,000	4,413	1,652.114	6,076	1·79	2.122 148	7,805	1·36
Hanover	1,305,351	1,868	1,688,288	2,416	1·40	1,844,651	2,640	0·41
Wurtemberg ..	1,395,462	3,939	1,611,317	4,548	0·74	1,690,898	4,773	0·24
Baden	1,000,000	3,592	1,264,482	4,542	1·26	1,335,952	4,799	0·27
Rest of Germany ..	4,217,307	..	5,298,978	..	1·22	5,985,228	..	0·61
Total . ..	23,103,211	2.413	30,010,711	3,134	1·42	35.334,538	3,690	0·85

In density of population the Prussia of before 1866 was twelfth amongst the German States, Saxony being at the head and Mecklenburg being last. The rate of increase has been in favour of Prussia ever since 1816; but Saxony has peopled her territory rather more quickly. On the other hand, Hanover, Bavaria, and Wurtemberg had scarcely advanced from 1837 to 1859. As regards religions, Prussia has a middle place: Mecklenburg, Saxony, Brunswick and Wurtemberg for instance containing more Protestants than Prussia.

As to Religions.

17. The relative importance of the agriculture of Prussia and of the other German States can be seen by the following Table, condensed from Dr. Viebahn's work on the Zollverein:—

As to Agriculture.

	Price of Rye.	Cereals.	Per Acre.	Other Produce.	Per Acre.	Meadows and Pastures.	Per Acre.	Total Raw Produce.	Per Acre.	Net Returns from Soil.	Per Acre.

Total . ..	190,600	1,420,719	5	41	1,339,889	3,780,370

19. In the last place there is Prussia's position in the North German Confederation. This is scarcely a relative position; it is a preponderating position in nearly every respect. If in respect of population, agriculture and industry, Bavaria, Wurtemberg and Baden be eliminated from the foregoing respective Tables, it will be at once perceived how preponderating her physical power is. Her political power is not less preponderating. Her political position in the North German Confederation is not a subject relevant to this Report; but her predominant political position has been ably sketched by a writer, who is evidently well acquainted with his subject, in a recent number of the "North British Review," in an article on the Reconstruction of Germany. In the North German Confederation.

(B.)—The Political Economical, and Social Conditions of Prussia.

(a.)—*Introductory.*

20. In the principles of political economy which prevailed in the Government of Prussia, as of many other German States, is to be traced from an early date the influence of the inferences which were widely made from the successful administration of Colbert in France. The chief defect of that administration was the want of a due consideration for the interests of agriculture, and especially for agricultural organization. The chief defect in the principles of political economy, by which Prussia was governed, was likewise the want of a due consideration for the interests of agriculture and for agricultural organization. A revolution applied a violent remedy to the evils which resulted in France. A legislation applied a radical but gentle remedy to the evils which resulted in Prussia. But, except in not dealing sooner with the oppression and obstructiveness of the feudal system, the Hohenzollerns displayed a praiseworthy aptitude for understanding and turning to account each more advanced principle of government as it became known or practised in another State. Before Adam Smith became known in Germany, Prussia was already in advance of other German States. A Frederic the Great could exclaim, "I am tired of governing slaves;" and a Frederic William III could decree, "The State is not rich enough to pay inactive and idle members." On the other hand however Prussia was far behind in the adoption of sound principles of political economy. There was not only an unsound agricultural organization, but also a system of restrictions, prohibitions and monopolies which fettered the forces of the nation. The mercantile system flourished. The administration of the country was in some respects deplorable. Partial efforts had been made to remedy some of these evils. A Jena came to quicken the energy of the Executive and to numb the opposition of interested parties, so that Stein and Hardenberg, with numerous coadjutors, were enabled to inaugurate a new era not only of agricultural organization but also of an organization in other respects more in accordance with the principles of political economy. Thus, in 1808, the towns received an independent and better

Influence of Colbert's Administration.

Its defects.

Discernment of the Hohenzollerns.

Defects in the Prussian economy.

Remedies.

local government; in 1807 the equality of all classes in taxation was recognized; in 1808 an industrial reform was decreed; also in 1808 the political and local administration of the State was radically reformed; also in 1808 the administration of justice was separated in the provinces from the political administration. Various monopolies and restrictions were abolished; various taxes were repealed, and others were lessened; a new customs system was established, and greater freedom of internal as well as of external traffic was thereby promoted. The reform of the laws affecting the wage-receiving classes was of importance. So was many another law to which the new era gave life. But this brief and incomplete enumeration is the only notice which can be here given to these numerous acts of legislation, which since the beginning of this century have, apart from the legislation directly or indirectly affecting land, contributed in a very great measure to the present prosperity of Prussia. That legislation relative to land forms the subject of the subsequent part of this Report; but it must always be borne in mind that an enlightened collateral legislation advanced side by side with that legislation, and promoted the development of the national wealth and the increase of the national weal.

(*b.*)—*Her Political Organization.*

Parliament.

21. In a previous paragraph (No. 6) the Prussian Parliament has been noticed. It will suffice to add to that notice the following interesting facts. Out of 19,000,000 inhabitants in 1866 more than 3,500,000 were electors. These elected 70,496 electoral delegates, who returned the members of the Lower House. In the last election, as has been already observed, about 30 per cent. of the electors voted. Sometimes this percentage reaches to 35, but I can hear of no instance of half of the electors exercising their power of voting. The voting is public, and it appears from some statistics of 1863 that out of every 100 voters—

48·8	voted for the	Liberal Party.
30·6	„	Conservative Party.
2·0	„	Catholic Party.
11·9	„	for the Polish Party.
6·7	unknown.	
100		

In the towns the Liberals possessed 67 per cent. and the Conservatives about 20 per cent.; whereas in the country the Liberals and Conservatives obtained 75 per cent. equally divided amongst them.

Division of Territory.

22. The political distribution of the territory is by Provinces, divided into Provincial Districts ("Regierungsbezirke"), containing the smaller Departments ("Kreise"), into which enter the Town Communalties ("Stadtgemeinden"), *i. e.*, Municipalities, and the Country Communalties ("Landgemeinden"), *i. e.*, municipal institutions for rural districts, which are unknown to our national economy. The Provinces have their Representative Councils. Usually they consist of members who own Privileged Estates ("Rittergüter") or who represent the Town and Country Communalties; but in Silesia, Saxony, Westphalia, and the Rhine Province there are some special rights of membership belonging to nobles. The smaller Departments ("Kreise") have also their Representative Councils, as likewise the unions of Communalties. The local administration of the Country Communalties in the six Eastern Provinces requires a great reform. A reform of the administration of the smaller Departments ("Kreise") is now under debate in the Chambers. It is curious to note how rapidly public opinion gains strength. The present Bill for this reform is much more liberal although proposed by a Conservative Government, than the Bill rejected a few years ago, yet it by no means satisfies the Liberal party. It may be so liberalized by them that the House of Lords will reject it, and that soon a still more radical reform will be carried. Public opinion in Prussia seems to have made such rapid strides, that as soon as any part of an old institution is touched the institution itself disappears. There appears to be no middle course between letting it alone and replacing it by a new institution. This Bill is the battle-ground between the old principle of privileges inherent in the land and the new principle of representation apart from special privileges for landowners. In the course of this Report frequent references will occur to Privileged Estates ("Rittergüter"). These are estates, belonging now or formerly to noble families, which carried with them certain privileges as appertaining to the possession of the land.

"Rittergüter."

23. These privileges or political rights of the land require a brief special notice. They consist partly in the rights of judicial administration by landowners—(another form of our Justice of the Peace?)—partly in a special position in the corporate representation of the departments and provinces, and partly in an extended constitutional capability of

holding seats in the Legislature of the State. Upon these privileges are based the so-called "Rittergüter," which by the Prussian General Body of Law could only be held by nobles. The national agriculture legislation destroyed this exclusive right of holding in respect of such lands, but did not expressly destroy the privileges attached to the possession of such estates; but gradually these privileges have been lessened. On the Rhine and in Westphalia the judicial privileges were abolished by the French, and were only partially re-established under Prussian rule; but in the six eastern provinces they maintained themselves till 1849. By a Decree of 1849 and a Law of 1851 they were all abolished; but in 1856 they were mostly re-established for all such lands, except in some extreme cases, such as the minute subdivision of the lands or the sale of them to a country communalty; consequently the police administration is even now in the greatest portion of the country communalties of the eastern provinces still in the hands of the owners of such privileged estates. The owner can himself on duly qualifying for the office perform the police functions of supervision, or he can present to the office. This police administration is in power similar to, but not co-extensive with, the administration of our Police Magistrates or that of our Justices of the Peace. Then there is the yet more general privilege of a special position in the representation of the departments and provinces. Thus, in the Provincial Councils the owners of such estates are 233 to 182 representatives of towns and 124 representatives owning other landed estates. They can usually determine the decisions of the Councils. In the Departmental Councils the influence of the privileged estates is still greater, for the following is the aggregate constitution of these Councils:—

9,483	votes representing	privileged estates.
532	„	other landed estates.
1,329	„	towns.
2,207	„	country communalties.
13,551		

In the next and last place there are the special privileges, as derived from the possession of land, which give seats to certain landowners in the Upper Chamber of the Legislature. Of these, fifty-six seats are hereditary and eleven seats are held by special call to the House.

24. It would be interesting to sketch the chief features of the provincial and departmental organization, and especially to refer to the peculiar institution of County Councillors ("Landräthe") who preside over departments and convoke the councils, but neither time nor the scope of this Report will admit of further reference to such subjects.

The Law.

25. A notice, cursory as it may be, of the institutions of a State, would not however be complete without a reference to its laws. There is scarcely another country which displays so many systems of laws and such diversity in law as Prussia. First there is the common law which is peculiar to Germany; then there are the local modifications of it which constitute Prussian Provincial Law, of which part is now statute law, but part is still common law; then there is the Prussian body of law ("Allgemeines Landrecht") which is a summary of such principles of law, and also a compilation of so much of the common law and of the provincial common or written law, and of the statute law, as were at its date more or less unrestrictedly common to all parts of the kingdom. The common law remained to influence the development of laws, and the provincial laws remained in their diversity to form in many cases exceptions to general common law. The "Allgemeines Landrecht" is therefore strictly speaking no code, neither is it a collection of laws. Consequently it is in this Report arbitrarily translated by the term "Prussian Body of Law." The struggle between the German common law, as crystallized from the customs and life of the people, and the civil law, as originally introduced under the influence of the Holy Roman Empire and subsequently developed by German jurists, is interesting, but can find no place here. It suffices to observe that the influence of the civil law can be traced in many parts of the systems of law to which Prussia has been and is still subject. Even in the Prussian Body of Law, which was fundamentally German law, the civil law can be traced.

"Body of Law."

26. The Prussian Body of Law, which has not been without influence on the rest of Germany, and which was in many respects a pattern of legislation for its age, deserves a rather longer notice. It was promulgated in 1794 in German, which was then recognized as a fit language also for law terms. Parenthetically it may be remarked that, at the present time, the Prussian laws are drawn with remarkable simplicity and clearness and with a praiseworthy absence of old and uncouth and foreign law terms. The Body of Law certainly contained the germs of many a fruitful subsequent law or institution, whatever may have been the defective principles of political economy which it displayed. This will

be shown by a brief sketch of its chief provisions. Serfdom is left to the domain of the provincial laws. Forced service for land was maintained but with indications of abolition. The State is to establish schools in order to instruct the youth of the nation "in useful knowledge and science." Parents are bound to make their children useful members of the State. The founding of guilds is no longer at will but subject to consent of the Crown, and the tendency is not to extend the compulsory powers of the guilds. The State can alter for the benefit of all the bye-laws of such guilds. The double signification of money is recognized. As to real credit the maxim of the civil law, *Plus cautionis in re est quam in personâ*, is followed. The Mortgage Debenture system is amended and improved. The system of indefeasible heritages is confirmed and even slightly extended. Restrictions of entails appear. The acquisition of land in mortmain is rendered more difficult. Divisibility of the land is not forbidden, but restrictions of it are laid down. Many hindrances to marriage are removed and morganatic marriages are rarely admissible in law. On the other hand the Body of Law failed to recognize many principles of political economy which were then well known; but that it does not hold the language of modern political economy is not astonishing, for the first readable translation into German of the "Wealth of Nations" did not appear till 1795, and the German political economists did not begin to write till after the Body of Law was in force.

Subsequent Legislation.

27. The legislation, which has followed in the seventy years since the promulgation of the Body of Law, has been enlightened, and in several respects in advance of that of the most advanced State. To the beneficent influence of such a legislation, apart from that branch of it which is called the National Agriculture Legislation, it is imperative upon all who study Prussia's development to attribute a large share of her present prosperity, a prosperity which has been attained in spite of many a political drawback. The political drawbacks have mostly originated in the political government of the country as distinguished from the internal political administration. This latter has failed mainly in being too centralized and in too minutely interfering with the daily life of the subject. The tendency now is to decentralize to a considerable degree; and self-government, as well as self-help are the corner stones of the political edifice which is being erected.

(c.)—*Her Finances and Taxation.*

Small National Expenditure.

Taxation.

28. It is evident that, other things being equal, the country which is governed and administered more cheaply than another country must be in a better position than that other country. But the comparison is never so simple nor is the inference so clear. Prussia is no exceptional country in this respect; yet, after all due allowance for unequal conditions in the comparison, Prussia is certainly more cheaply governed and administered than many other countries. And it cannot be said that efficiency has not gone hand in hand with cheapness. This fact of a small national expenditure has been noticed in paragraph 10 of the preceding division. A few remarks can be added. The Budget has increased rapidly in amount during the last quarter of a century. It was only about 15*s.* per head of the population in 1844, whereas it is now about 25*s.* per head of the present population. The direct taxation has been increased by 50 per cent., and the indirect taxation by 29 per cent., in order to meet the greater expenditure. Fortunately for the taxpayer, the revenue from the Crown lands and forests had doubled in the same period. The army costs 6*s.* 8*d.* per head instead of 5*s.*; and the national debt 2*s.* 9*d.* instead of 1*s.* 6*d.* Thus the economy of Government and administration is not so great as it used to be, but the national expenditure is probably in about the same proportion to the national wealth as it formerly was. It is not considered that the taxation of Prussia has retarded her progress, or that she is taxed at all beyond her tax-paying powers: yet there seems to be little elasticity in her revenues. On the whole it must be conceded that the national agriculture legislation has also been materially aided by the financial administration of Prussia in its influence upon the development of the nation.

(d.)—*Her Population.*

29. The following five Tables will give the leading points of interest in regard to the population of Prussia:—

(1.)

	1816.	1831.	1840.	1849.	1858.	1864.	1867.
Number of inhabitants ..	10,319,993	13,038,970	14,928,503	16,296,483	17,672,609	19,188,608	19,663,524
Increase per 1,000 ..	..	263	184	132	123	157	46
Number per square geographical mile ..	2,030	2,565	2,936	3,206	3,407	4,775	4,857

(2.)—Table of Population in 1864.

Inhabitants.	Number.	Number Per Square Geographical Mile of Total Area.	Number Per Square Geographical Mile of Cultivated Area.	Number per Square Geographical Mile of Crop producing Area.	Number in 1867.
Prussia	3,014,595	2,559	3,656	5,098	3,063,085
Pomerania	1,437,375	2,492	3,553	4,651	1,426,430
Posen	1,523,729	2,842	3,948	4,706	1,519,191

	To every 1,000 Men.				Average from 1862–64.				
	Over 24.		In general Married.	Who have lost their Wives.	To every 1,000 in all.	Legitimate.		Illegitimate.	
	No.	Unmarried.				No.	Surviving.	No.	Per cent.
Prussia	202	40	172	10·3	45·4	41·4	4·2	4·0	8·8
Pomerania	225	41	166	13·5	39·6	35·6	4·7	4·6	10·2
Posen	218	32	167	9·3	44·8	41·7	4·0	3·1	6·9
Brandenburg ..	242	59	162	12·3	37·0	32·7	4·9	4·3	11·6
Silesia	234	40	172	12·6	40·5	35·9	4·7	4·6	11·3
Saxony	242	46	174	16·8	38·4	34·6	5·0	3·8	9·9
Westphalia	245	67	158	17·4	35·6	34·2	4·6	1·4	3·9
Rhineland	246	71	154	17·8	36·5	35·2	4·4	1·3	3·6
In Monarchy	234	50	165	13·8	39·6	36·3	4·6	3·3	8·3

(5.)—Table of Rejection, &c., for Military Service.

Average from 1831 to 1862,—To every 1,000 inhabitants:—

1. Men of 20 years	10·8
2. Men previously presented	18·6
3. Total	29·4

To every 1,000 men liable:—

4. Incapable from physical or mental defects	56·0
5. Temporarily incapable from weakness or ill-health	324·0
6. Temporarily incapable from being under 5 feet 4 inches	232·8
7. Incapable for other reasons	86·6
8. Remained for service	172 0
9. Taken for service	96·6
10. Left for future disposal	74·9

These Tables require very few observations. It will be noticed that the population has nearly doubled since 1816. The balance of about 176,000 was against Prussia in respect of emigration and immigration from 1844 to 1863. But the figures from which this balance is found are not altogether trustworthy. It is interesting to note that the urban population, apart from the influence of immigration into towns, increases faster by

Employments of Population.

one-third than the rural population. The following statement of the proportions of persons engaged in 1861 in certain categories of employment is likewise interesting :—

Military service	1·20
Civil service	1·67
Agriculture	45·26
Industry and trade	33 57
Manual and day labour	12·00
Servants not in agriculture	2 83
Without occupation	3·47
	100·00

It will also be noticed that the annual rate of increase in population is not as great since 1864 as in the period 1858 to 1864. The rate has already slackened. With regard to the Table of Nationalities, it may be added that of the children instructed in the elementary schools in 1862 to 1864, 85½ per cent. were German, 13 per cent. were Polish, and the rest were of other nationalities. Of the children who spoke various dialects of Polish or who spoke other languages, more than 27 per cent. spoke also German. Hence nearly 90 per cent. spoke German, and only 10 per cent. spoke no German. With regard to the density of population on the cultivated parts of the provinces, and to the frequency of marriage, and to the proportion of illegitimate births, it is curious to observe that in Westphalia and the Rhine Provinces, where small properties prevail and the fruitfulness of the soil is, on the whole, highest, that density and that frequency on the one hand are greatest, and that proportion on the other hand is least. This subject belongs, however, in its details to another part of this Report. The last Table is founded upon the statistics of the physical examination for military service. Finally, it may be noticed that nearly 3,000,000 of children were being educated in the elementary schools in 1862-64, and only 2 per cent of the children under legal obligation to attend the elementary schools failed from various reasons—such as ill-health, &c.—to thus attend. This number of 3,000,000 is out of 6,390,000 of children under fourteen years of age who were counted in 1864. The compulsion to school attendance dates like many another beneficial institution from the reign of Frederic the Great.

German-speaking children.

Westphalia and Rhine Provinces.

School compulsion.

(*e.*)—*Her Religions.*

30. The following Table will show the distribution of religions by provinces :—

Provinces.	Christians.									Jews.		
	Lutheran.			Catholic.			Others.

The ecclesiastical organization of Prussia, or rather the organization of Prussia for the observance of religion, is interesting; but although it has probably had much influence in the development of Prussia as a nation, it can only be thus briefly alluded to in this Report.

(*f.*)—*Her Agriculture.*

31. The following Table will show the absolute importance of agriculture. Its relative importance can be seized by considering three facts; viz., that in Prussia 60 per cent. of the yearly production and consumption originate in the possession of land; that 41 per cent. of the population live directly by agriculture; and that 11 per cent. are auxiliarily engaged in agriculture :—

1864.	Persons with their families engaged solely in agriculture	4,261,683
	Ditto, engaged partially	1,881,143
	Labourers, servants, &c., employed in agriculture	2,246,005
	Total	8,388,831
	Number per square geographical mile	1,679
	Persons engaged in industry connected with agriculture	245,793
	Number of industrial establishments	64,442

* In 1816 the Mennonites only seem to have been counted.

† The increase is amongst the Dissenters ("Dissidenten.")

As the agricultural conditions of land in Prussia form the subject of the third part of this Report, it is needless in this introduction to add any observations to the foregoing Table.

(*g.*)—*Her Industry.*

32. In paragraph 18, a comparison of the industry of Prussia with the industry of other German States has been instituted. To the general figures there given nothing need be here added. But it is necessary to refer more fully to the industrial occupations of the Prussian people. The industrial occupations in connection with agriculture are in their details as follows:— Industry connected with Agriculture.

	In Monarchy.	
	Number of Establishments.	Persons employed.
Lime kilns	2,256	8,376
Brick yards	7,649	45,550
Oil mills and refineries	3,755	8,436
Flour mills	29,577	52,957
„ steam and horse-power	2,431	4,101
Tobacco and cigar factories	1,379	26,325
Sugar mills and refineries	218	34,913
Breweries	6,834	16,840
Distilleries	8,263	22,198
Fisheries	..	7,604
Gardening industry	..	2,205
Millwrights	..	7,619
Vinegar factories	497	1,042
Other industries	1,585	7,632
	64,442	245,798

	In Monarchy.			
	Number.		Per square Geographical Mile.	
In industries, as enumerated	..	245,798	..	49
In the small industries:—				
Masters	95,938		19·1	
Journeymen	37,376		7·3	
Apprentices	23,025		4·6	
Total	..	156,339	..	31·0
Grand total	..	402,137	..	80·0

33. Prussia is rich in useful minerals. In 1865 there were 2,344 mines in operation, with a resulting value of produce of about 7,200,000*l.* They employed 148,070 labourers whose families consisted of 256,435 wives and children. The chief useful mineral is coal, which in no European State is in greater quantity than in Prussia. From 409 pits a quantity of nearly 20,000,000 of tons, valued at about 5,000,000*l.*, was won. They employed 89,200 labourers. The increase of this industry can be thus showed:— Mining Industry. Coal.

	Millions of Tons.
In 1824 the produce was about	1½
1844	3½
1854	7
1865	20

Westphalian coal now competes at the North Sea ports with English coal, which it approaches in quality. There are also useful kinds of brown coal, which are worked in 511 pits, employing 14,200 labourers. From them more than 5,000,000 of tons of a value of over 700,000*l.* sterling were won. Iron ore is also one of the useful minerals. There were in 1865 no fewer than 1,071 mines, employing 17,800 labourers, and producing nearly 2,000,000 of tons of ore of a value of nearly 600,000*l.* sterling. Zinc is another well-known production of Prussian mining, and its production is greater than in any other country. In 1865 there were 77 mines, employing 10,800 labourers, and producing about 350,000 tons of zinc and blende of a value of about 340,000*l.* This also is an increasing industry. Lead and copper are also other useful minerals of Prussia. These were in 1865 for lead, 168 mines, employing 10,500 labourers, and producing about 60,000 tons of a value of about 420,000*l.*; and for copper 69 mines, employing 5,200 labourers, and producing about 145,000 tons of ore of a value of about 150,000*l.* Salt works employ Iron. Zinc. Lead and C

hers.

460 labourers, and produce about 37,000 tons of a value of 35,000*l.* The other useful minerals of Prussia are quicksilver, arsenic, manganese, sulphur, and alum, with an aggregate production of about 560,000 tons, of which 530,000 tons belong to sulphur and alum.

E
P

nufacturing lustry.

34. Besides her mining industry Prussia has a very important manufacturing industry which has made an immense stride, especially in the last decade. How far this is due to internal causes and how far to external causes, it is not for this Report to notice. But the surprising fact is patent that Prussia within fifty years has passed from the condition of an almost entirely agricultural land to that of a largely manufacturing, as well as an importantly agricultural land. Of her manufactures the most important are metals, cottons, woollens, and silks and velvets. Amongst the minor manufactures are chemical products, glass, earthenware and porcelain, papers, wood wares, tobacco and cigars, beetroot sugar, beer, and spirit. The following comparative Tables for 1846 and 1861 will show the increase in importance, as judged by the people employed, of various kinds of manufacturing industry:—

Employed in	1846.	1861.	Increase or Decrease.
Manufacture of articles of consumption ..	101,288	165,865	+ 64.577
,, of woven articles	175,942	108,630	— 67.312*
Mining	41,753	71,836	+ 30,083
Metal works	27,102	57,116	+ 30,014
Spinning	33,311	40.572	+ 7,261
Machinery works	11,133	34,025	+ 22,892
Manufacture of metal wares	18,632	27,151	+ 8,519
,, of chemical products, &c. ..	12,052	26,987	+ 14,935
,, of paper wares	10,705	14,488	+ 3,783
,, of wood, horn wares, &c. ..	5.702	13,496	+ 7.794
In other industries	16,395	23,664	+ 7,269
Total	454,015	583,830	129,815

Thus in fifteen years the persons employed have increased by 29 per cent., but the population within the same period increased by only 13 per cent. The smaller industry, chiefly of manual labour, has also augmented, for it employed in 1846, 890,000 persons, and in 1861 over 1,200,000 persons, showing an increase of 35 per cent. The following statement showing the enormously increased use of steam machines is also interesting:—

	1846.		1861.	
	Machines.	Horse-power.	Machines.	Horse-power.
In Mining	274	9,519	1,528	60,387
Agriculture	48	504	242	4,172
Spinning and weaving, &c. .	237	3,236	738	16,152
Metal works	128	3,918	621	16,639
Machinery works . ..	80	939	373	4,139
Corn mills	71	927	600	8,101
Other industries	301	2,672	2,567	27,787
Total	1.139	21,715	6,669	137,377

nufactures of n.

Steel.

Zinc.

35. The iron works constitute a rapidly rising manufacture, for their produce of nearly 1,500,000 of tons, of a value of nearly 10,000,000*l.* sterling, is in value 52 per cent. above the produce of 1861. The steel works are also a rising manufacture, for their produce of 100,000 tons, of a value of 2,500,000*l.*, is in quantity and value treble those of 1861. The zinc works are also extending, and their produce has a value of 1,500,000*l.* The copper and brass works are also of importance, their produce having a value of 750,000*l.* The other metal works are of much less importance. Machines (especially locomotives) and railway waggons have become an important industry, and the persons employed are quadrupled since 1846 and actually number about 30,000. The manufactures of iron, zinc, copper, bronze and brass, and other metal wares of all kinds have been much extended, and employ over 20,000 persons.

stile Manu-ures.

36. The textile industry has taken a notable place. Spinning employs over 40,000 labourers, or 22 per cent. more than in 1846. The spindles have increased to 1,200,000, or 80 per cent. more than in 1846. Weaving employed in 1846, 157,000 workmen, 4,600 machine looms, and 78,000 hand looms; and in 1861, 84,500 workmen, 15,250 machine looms, and 28,000 hand looms. Steam-power is responsible for the diminution

* This diminution was caused by the substitution of steam labour for hand labour.

in workmen. Cotton spinning had in 1861, 398,000 spindles, and nearly 8,000 workmen; the spindles having more than doubled since 1846. Cotton weaving had, in 1861, 7,200 machine looms and 4,800 hand looms, and 13,300 workmen. Wool spinning had, in 1861, 651,000 spindles and 14,000 workmen. Wool weaving had 1,880 machine looms and 8,560 hand looms, and 26,000 workmen in connection with the spinning mills, and also 33,270 looms in the small industry, employing 10,770 masters and 26,100 apprentices and journeymen. The linen industry has recently acquired greater importance, especially in Silesia. In 1861 there were 21 flax mills with 106,500 spindles and 6,670 workmen, and 69 weaving establishments, with 244 machine looms, 1,840 hand looms, and 3,000 workmen; and also in the small industry about 300,000 looms, of which 43,000 formed the sole industry of their owners. The other textile industries are not of sufficiently relative importance to be noted in this brief review.

Of Cotton.

Of Wool.

Of Linen.

37. The mineral industry employed 100,000 persons in 1861, being an increase of 50 per cent. since 1846. Of this industry the earthenware and porcelain branch and the glass branch are of importance. The former employed 4,700 and the latter 5,600 workmen. But first in importance is the manufacture of chemicals, which in 1861 employed 27,000 persons, or more than double the number of 1846.

Manufactures fro
Minerals.
China.
Glass.
Chemical Product

38. Of the other kinds and branches of industry the following only require special mention. The beetroot sugar manufacture has increased from 79 mills, producing 10,000 tons of raw sugar in 1844, to 213 mills, producing 130,000 tons of raw sugar in 1866. They now employ about 35,000 persons. The manufacture of tobacco and cigars has doubled in importance, now employing about 27,000 persons. The breweries have increased in importance, but diminished in numbers. They now produce about 260,000,000 quarts of beer, and the consumption is about 14 quarts per head of the population. Berlin, however, consumes 52 quarts per head. Distilleries form now an important auxiliary industry to agriculture. Of 7,800 existing in 1864, no fewer than 6,400 were in the country. They then employed about 23,000 persons, whereas in 1846 they employed only 17,000. Of their produce four-fifths are consumed within the State, and the other fifth is exported. The paper mills employ nearly 10,000 persons, being an increase of 50 per cent. since 1846. The wood, horn and whalebone manufactures have increased since 1846 by nearly 200 per cent. to the important position of employing about 14,000 persons. Industries, connected with printing, lithographing, &c., which in Prussian nomenclature are called "polygraphic," employ some 12,000 persons.

wares.

39. From this cursory review of Prussia's industry an idea can, it is hoped, be formed of the industrial occupations of her people, and of the general bearing of such occupations upon the Land Question. Its special bearing will be referred to in the third and following parts of this Report. But it may now be observed that the greater portion of her industry is in connection with the produce of the land, and that that industry, even apart from her mining industry, is in intimate connection with her agriculture.

(*i*).—*Her Commerce.*

40. Prussia formerly depended upon her agriculture and the traffic of her towns for her wealth, but her Rulers have always tried to promote the development of a sea-going commerce. Frederic the Great was the chief of them, and it was he who founded the banking institution called the "Seehandlung," which, as its name imports, was intended to promote a foreign commerce by sea. The erection of the Zollverein has, however, the most contributed to the creation of a large trade. This union replaced nearly 200 Customs districts.

41. Commerce employed in 1861 nearly 27,000 persons, being an increase of nearly 200 per cent. since 1846. Shipping, both sea-going and inland, has more than doubled in the last quarter of a century. The increase of railways is well known. There are now about 250,000 English miles of roads, forming a large increase within the last fifty years. The increase of postal and telegraphic facilities need not be specially mentioned. But the Chamber of Commerce deserve special mention for their beneficial influence upon the commercial development of the country.

Persons in Com-
merce.
Shipping.

42. For estimating the foreign commerce of Prussia, apart from that of the Zollverein, the statistics of the latter are alone available. These will be used, with the preliminary remarks, that by far the greater portion of the exportation and importation belongs in nearly every category of wares to Prussia. By quantities the following Tables will show, for 1867, the exports and imports:—

Foreign Commerce.

Exports and
Imports.

Denomination.	Imports.	Exports.
	Tons.	Tons.
Cotton, raw, yarn, &c.	159,300	30,000
„ tissues	856	9,500
Woollen, raw, yarn, &c.	50,800	18,000
„ tissues	2,950	16,200
Linen yarns, &c.	8,800	1.600
„ tissues	5,700	17.200
China wares	56,500	225,500
Chemical products, &c.	151,200	70,000
Iron, rough, &c.	143,600	51,300
Iron and steel wares	11,700	39,400
Iron ore	152,600	228,000
Other ores, &c.	184,000	295,500
Lead and lead wares	..	26.500
Coal of all kinds	1,710,000	4,294,500
Copper, rough, &c.	9,000	..
„ wares	500	..
Glass wares	6,200	19,500
Paper wares	..	16,600
Other goods	393,500	850,000
Total	3,046,700	6,409,300
	£	£
Valued with cattle, cereals, wood, &c., at	87,000,000	65,500,000

In conclusion, it may be remarked that, of the value of the exportation—

52	per cent.	is in respect of	manufactures.
19	„	„	articles of consumption.
17	„	„	of raw materials.
12	„	„	of half manufactures.
100			

On the other hand, the increased importation of raw materials and half-manufactures tends also to show the development of manufacturing industry in Prussia.

43. This brief review of the political, economical, and social relations of Prussia cannot be closed without remarking that it is evident that Prussia owes her present prosperity not alone to her National Agriculture Legislation, but to numerous other influences, not only of legislation, but of industrial and commercial development. Many of the topics touched in this review are only imperfectly and hurriedly mentioned; but it is nevertheless hoped, that this part of the Report will not altogether fail in its object, of offering a general view of Prussia's position, as a general introduction to the important subject of land and its relations in Prussia.

Part II.—The Legislation affecting Land.

Usual conception of land in its relation to man.

1. The law may base its dealings with land either on the conception that man was made for the land, or on the conception that the land was made for man. The history of the legal incidents of land in Europe shows that the former was the fundamental conception of the law. Accordingly, the land became too frequently the unchanging object of fixed ownership, and did not follow the changing lot of the proprietary cultivator, or even of the lord. Indeed the cultivator and even the lord seldom appeared as a legal person, but the landed property with its cultivators bore the character of a legal person. This conception of landed property is also that of German custom and German law, and consequently that which has moulded the earlier legislation and influenced the later legislation on land in Prussia.

Influence of outward arrangement of landed estates.

2. This mode of regarding land renders it necessary in Prussia as in other countries to take into account the influence of the outward arrangement of landed estates on the development of the laws affecting land. For this outward arrangement acts in two ways: it acts as regards the outward arrangement of the land upon legislation for the promotion of agricultural improvements; it also acts as regards the outward arrangement of the estates upon the legislation for improving the legal relation between man and land. Such an outward arrangement will at any given time be the net result of the original settlement of the land, and of the influences exercised subsequently in the course of political and social growth by impulses both from within and without the nation.

An inquiry into the existing legislation presupposes, therefore, a sketch not only of

previous legislation, but of the original settlement of the land and the resulting outward arrangement of landed estates.

(A.)—General Historical Introduction.

(*a.*)—*From the early Settlement to the Death of Frederic the Great.*

Ancient settlement of German land.

3. The earliest migrations into German land took place in the prehistoric period. At the beginning of the Christian era the Romans found "the tribes between the Vistula and the Rhine to be not half savage nomads, but tillers of the soil, brewers of beer, and traffickers in woollen mantles and in soap, who were settled not in towns but in organized districts." From this period to the seventh century no materials exist for tracing the progress of these tribes. But since the seventh century sufficient materials exist for warranting the statement that the earlier settlements on the land were the result of Land Communities.* The boundaries of their lands were the natural ones of hills and river valleys. They divided and sub-divided into distinct societies. Either all these societies continued to use the lands in common; or each society received a separate portion of cultivated land, continuing to use pastures and forest in common. Conquest, personal prowess and occasional separation of property for individuals altered gradually this universal character of these Land Communities. Between the territories of such communities there often remained large forests which the Sovereign subsequently appropriated either as Crown property for the occupation of peasants or for allotment to grandees and monasteries.

Land Communities.

Colonization.

4. About the eleventh century the colonization of lands assumed importance, and soon extended into the Polish districts. The Slavs were so numerically weak, that German colonies spread through Brandenburg eastward, and into Pomerania and Silesia. This colonization was peaceful and was brought about by the reigning Princes and their grandees for their own private advantage. The colonists appear to have usually paid rent or tithes or both.

Variety of landed estates.

5. Under these circumstances there grew up a variety of landed estates. Thus in Westphalia from the principle of the land community there arose the common use of forest and pasture either by independent peasant farmers or by a whole community; thus arose also the estates (called "Vöhden") in which the land was cultivated for four to six years and then abandoned for four to six years to common pasturage, and the estates (called "Esche") in which the land was under continuous cultivation and in the possession of several proprietors whose rights were restricted by rights of the community. But the influence of the colonization in Westphalia, which appears to have begun by immigration of Dutch and Flemish peasants and thus to have received a different impulse, was towards the creation of "independent farms."* This system with various modifications obtained along, and to the west of, the Weser, and ultimately crossed the Rhine to Aix la Chapelle. But on this side of the Weser and from the Moselle to the Elbe the opposite system of "close villages"* obtained, in which the remains of the old arrangements in common were retained in an astonishingly primitive form. The peasant population of a village formed one or several agricultural societies under the names of farming societies ("Gehöferschaften") or perpetual societies ("Erbgenossenschaften"), which possessed the whole district with the exception of the so-called "free farms" which had been carved out of the district for individual proprietors. In many of these districts, as in Saarhölzbach so recently as 1863, the only private right of property was to the house and any small garden belonging to and adjoining it. All the land of whatever kind, with the exception of a varying portion which remained for common use, was periodically divided by lots amongst the owners in common according to their rights, and thus changed ownership according to the results of the drawing. Those rights of a drawer were to possess the same quantity as he then possessed either from a former drawing or from accumulation by purchase or inheritance. Hence the drawing gave him the one advantage of consolidating his land. As regards the tilled lands the drawings were originally held every three years, but afterwards every six, twelve, or more years. The lands of each kind differed naturally in quality; hence each kind was carved into squares of one quality, and each square was divided into as many strips, wide and narrow, as there were owners of varying quantity. This kind of close village did not exist, however, in the previously Slavonic territories. In them the lands of the close village at its erection according to German custom were divided by lot, but there is no evidence of subsequent consolidation by lot. On the other hand they were subject to pasturing of sheep by the lord of the manor,* and to the fallow and stubble grazing of the common flocks.

Independent farms.

Close villages.

* *Vide* Appendix of Definitions and Terms.

Standards of allotment.

6. In the apportioning of the lands—in the case of colonization, for instance—two standards seem to have been used, the "Flämische-Hufe"* and the "Frankische-Hufe," which were in most districts subsequently considered as the same. The former contained about 98 acres and the latter about 102 acres. In Silesia, however, the two standards were contrasted, and the former contained only 47 acres, whereas the latter contained nearly 98 acres. If the example of Zedlitz in 1257 be taken as a type, the former was the size of the apportioned lands in the best situations, and the latter the size of the apportioned lands in the less favourable situations. Each portion of land paid in kind the same rent, but the former paid in money half a silver mark, whereas the latter paid one silver mark. The greatest portion of the latter appears also to have been cultivated from the same farmsteads as the former. Nearly a quarter of Silesia is partitioned out in accordance with this system.

lose estates.

7. Opposed to the outward arrangement of these chief forms of peasant estates is that of a district intended for cultivation by one owner and forming a large "close estate."* Small isolated portions of tilled land were carved out from the forests and moors of the larger of such districts by squatters, and small farms were created thereon by the occasional separation of portions of the estate for various motives. Only a few large estates were unaffected by this process. Such estates arose chiefly from the separation of independent lands by the heads of land communities and from the gift of the Crown, and subsequently by accumulation. The majority of the colonies in the Slave lands were created by donation to a lord, who settled the colonists, and often retained large districts for his own cultivation. In the fourteenth century such estates for cultivation contained from 720 to 1,450 acres. From the beginning of the sixteenth century the lords of the manor added many new lands from forest and moor. But the number of such farming estates in the kingdom is smaller than could have been expected, if the number of existing "estate districts"* be regarded; but it appears that the estates which are sometimes coterminous with them are chiefly of modern origin. Moreover the landlords of the Western provinces never appear to have had sufficient inducement to return to the system of cultivating their own lands, which they had frequently abandoned in the Middle Ages. On the other hand, the farming of lords of the manor in the Eastern provinces has continually extended.

Feudal system.

8. Intermingled with such peasant and manorial estates, and in many cases overriding many a right of the peasant proprietor, arose the feudal system in various forms, with its serfs and forced services. How and why that system arose in this country as in other countries, need not be related here; nor need it be traced how the landed proprietors became, by the acquirement of special privileges, not only lords of nearly the whole of the land, but also the naturally born local authorities.

The so-called real services, *i.e.*, feudal and other services, attached to the land, and sometimes to the person, were partly obligations in acknowledgment of jurisdiction, partly obligations for the holdings or for reciprocal services, and partly obligations sanctioned by the custom of the country or district. They were discharged by annual payments in money or in kind, by cattle and harvest tithes, by hand, team, and other personal services, and, lastly, by the erection and maintenance of buildings, and similar services. The subjection of the peasant to the lord was so general that "the air makes us serfs" became a common expression. But the degree of serfdom was very unequal. Yet this condition was found sufficiently oppressive to cause the Peasant War of the sixteenth century. The demands of the peasants were such as were only granted three centuries later. The war was disastrous for the peasants, and public order was restored from Justinian's point of view. By the aid of the Roman Law a stricter theory of serfdom was constructed, and was then applied to the greater oppression of the peasantry. And this state of the relation of the peasantry to the lords of the manor continued with very little change into the beginning of this century, in spite of the efforts of the reigning sovereigns in the seventeenth and eighteenth centuries to bring about a state of things more favourable to agriculture. The chief result obtained was in many districts to change the personal services of serfdom into services rendered for holding the land. It must finally be noted that the peasant could never cease to be a peasant, and that the noble could not, from the beginning of the last century, annex the peasant's land to his own, but was bound to find a peasant-cultivator for it.

Variety of landed estates in provinces.

9. This brief sketch would not, however, be complete without glancing at the provinces separately, for in them arose certain districts where particular legal incidents of property in land prevailed, which still influence the present laws. In the lands on the left of the Elbe, a great variety of estates subject to so-called customs of the estate, or to customs of prescription, or of judicial decisions, were formed on the splitting up of large

* *Vide* Appendix of Definitions and Terms.

tracts of land into small and not very compact portions. Some of these were, in the main, subject to Frank Law, and others to Saxon Law. This latter was unfavourable to the full powers of the owner, and to the equal inheritance of his children. Its domain extended throughout Westphalia and into the Rhine provinces north of Düsseldorf. In Westphalia the system of close ownership has remained dominant in the separate and "independent farms." There, also, the right of succession attached to present estates was strengthened and confirmed. But the succession of the eldest or youngest son obtained according to the district. The so-called free "Meier"* owners could incur debts on their farms. The eldest or youngest son of the personally unfree "Meier" possessors inherited on payment of a fine. The so-called colonist lands ("Kolonat") were hereditary, but subject to services. The colonist held the lands as either hereditary for ever, or copyhold ("Leib") on one or more lives, or for a period of years renewable on payment of a fine. Westphalia.

In the Rhine Provinces similar estates existed, but in the southern portions the Frank Law obtained even in respect of peasants and gave them a property, subject it is true to services, tithes, &c., but unrestricted as to partition, either for sale or inheritance. In these Provinces there also existed estates leased to peasants. Rhine Provinces.

11. In the southern and western portions of the Province of Saxony the peasant* proprietorship consisted chiefly of the so-called "changing lands"* ("Walzenden Grundstücke") which were freely alienated and inherited. Notwithstanding this, many larger peasant farms, consisting only of such changing lands and in a flourishing condition, are now found by the side of the smaller properties. On the other hand quit-rents and later on hereditary leases* ("Erbpächte") and ground-rents* presented themselves in the northern and eastern portions, as also various holdings for services. Saxony.

12. In Brandenburg the colonists paid neither tillage-rent nor tithe, but rendered services, such as furnishing a horse for a campaign, which were afterwards commuted. The other peasant proprietors were partly feudal, and partly free, and partly the so-called "Kossäthen." They usually occupied two or three "Hufen" (180 to 270 acres?) and paid tillage-rent and tithes. The "Kossäthen" held land and dues of fowl or corn, or more frequently on condition of building the "Schloss" or of getting in the harvest. Brandenburg.

13. Pomerania offered a similar picture to Brandenburg; the peasants were, however, gradually converted into serfs; but in 1720 many holdings were changed into allodial estates. Pomerania.

14. In the Province of Prussia the Polish rule in the western divisions caused the emphyteutic holdings to spread and to extend into the eastern portion. They were partly for life, a period of years or certain generations, and partly hereditary for ever with a preference right of purchase reserved to the lord of the manor, who also received certain fixed dues. Peculiar to the Province of Prussia are the "Elokation" estates. These were created by allotting to citizens of Kulm and Dantzic uncultivated swampy lands, who let them on renewable emphyteutic contracts for a term of years for cultivation and use. Peculiar also to it were the "Lahn," "Quart," and "Gratial" peasant estates, which were perfectly free, except in the obligation to equip a soldier or to render some similar military services. More in west than east Prussia many peasant properties were in course of time subjected to a terminable lease of three or six years, the renewal being accompanied by increased fines. In 1702 the peasants upon the Crown property were freed from personal services and granted a title to the property. Prussia

15. In the Province of Silesia the German colonization was very important, and the German law absorbed the Polish law. Both in its upper and lower portions the peasant lands remained their own hereditary properties, excepting along the Polish frontier where so-called occupied lands existed. The peasant occupiers were however freemen, but rendered certain services. Silesia.

16. In the Province of Posen property of every kind had to struggle with the obstacles caused by its being now subject to German, now to Polish law. The peasants suffered much, for the attempt of the Poles in 1578 to convert all peasant lands into property of a lord of the manor caused much insecurity of property, which the subsequent Prussian rule had to remedy. Posen.

The foregoing outlines of the chief forms and leading incidents of landed property within the Prussian Provinces give an idea of the variety of holdings and rights which obtained till the beginning of this century, and which has left its mark upon the features of the country.

17. The Prussian law had been to the beginning of the eighteenth century occupied in more and more recognizing the encroachments of the lord of the manor upon the land and the serfdom of the peasants. On the other side there was the testimony of the "Sachsenspiegel" to the former rights and customs of the peasant proprietors. This work, The law recognized feudal system.

* *Vide* Appendix of Definitions and Terms.

which eventually entered into the law of several Prussian Provinces, notably into that of Silesia, was no doubt useful in withstanding the baneful influence of the subsequent application of Roman law in Germany to the rights of the peasants.

(*b.*)—*From the Death of Frederic the Great to the Stein-Hardenberg Era.*

Agricultural state of Prussia at end of eighteenth century.

18. At the death of Frederic the Great this then was the unsound and obstructive agricultural organization of Prussia. The largest portion of the peasant estates were subject to the more or less absolute dominion of lords of the manor, who, however, had not always succeeded in depriving the peasant cultivators of an hereditary or limited usufruct. The remainder of the peasant estates were held as freeholds, but the owners were generally more or less restricted in their powers of dealing with their property. Feudal services of various kinds were exacted by the lords from the peasants, who were for the most part serfs. Rights of common were so numerous and onerous as to materially interfere with the prosperity of the community. The evils of such relations between manorial proprietors, cultivating proprietors and peasants, did not escape the penetrating glance of Frederic the Great, but he failed to effect by the measures he took any great change in them. Wars and foreign policy occupied his reign. But the turning point in the history of Prussian agriculture must be placed in that reign, for it is marked by many an act of legislation, which testifies to a better conception of the true relations of man and land. The progress was however slow, till after the Peace of Tilsit. Then Prussia made a sudden and great stride and has continued to advance rapidly in the path of a development of her agricultural resources.

Sudden change after Tilsit.

Modern legislation not uniform throughout kingdom.

19. The modern Prussian legislation on the national agriculture was not in any part thereof until recently extended to the Rhine Provinces, where much of it was not needed after the introduction of French Law, has only been gradually extended to some districts of Prussia and is not at present applicable except in part to the recently acquired Provinces. It will be desirable, therefore, to trace the Prussian legislation usually so-called, then to glance at the legislntion for the Rhine Provinces, and finally to reserve the growth of the legislation of the newly-acquired provinces for subsequent inquiry.

Stein and Hardenberg.

20. The statesmen Stein and Hardenberg were not at the time of the events of 1806 to 1807 members of the Prussian Government; but both were occupied with maturing their ideas for the strengthening of the State by radical alterations of the relation between the ground and its cultivator. These ideas were based upon the opinions current chiefly in West and East Prussia, in consequence of the teaching of the University of Königsberg, and upon a careful consideration of previous but isolated legislation, chiefly in Silesia, with similar aims. Both statesmen were requested to report upon the means to be used for invigorating the State, and both placed the liberation of the peasantry from servitude in the foreground. A committee prepared a project of law for this purpose with the drawing of which Von Schœn was occupied. As soon as Stein was appointed, the Edict of 9th October, 1807, was issued for the whole kingdom. It aimed at facilitating the acquirement of absolute ownership, and the free use of landed property, as also at improving the relations between the different classes of land population. Its underlying principle was, as the King stated, "to remove whatever had hitherto hindered the individual from obtaining that degree of well-being which he was capable of reaching by exertions according to the best of his ability." It fixed Martinmas of 1810 for the completion of the liberation of the peasants from servitude. The provisions of the Edict were duly put into force, and the increase beyond all expectation in the national welfare during the next ten years bears testimony to the fruitfulness of Stein's policy. Not only were all ranks in the nation—landowners, citizens, and peasants—most materially benefited, but the peasant proprietors were raised to a much more important place in the economy of the State.

Edict of 1807.

This measure however remedied only one set of evils. Other measures were still necessary. Then also the Edict of 9th October, 1807, had caused no little commotion amongst lords and peasants, and even aroused in some quarters fears as to the economical result of so sudden and radical a change. Albert Thaer, familiarly called Father Thaer, was at this time (1809) persuaded, chiefly by Hardenberg, to enter into the service of the State. As he had won universal confidence by his agricultural experience and his sound economical views, the knowledge that the superintendence of this change was mainly in his hands went far to allay fears and create trust. In 1811 (Stein having been previously banished by Napoleon) Hardenberg was appointed Chancellor, and forthwith the two Edicts of 14th September, 1811, "for the Promotion of National Agriculture" and "for Regulating the Relations between Lords of the Manor and Peasants" were issued. Thaer founded them upon the principle that a partial and gradual abolition of the services and

Thaer in 1809.

Edicts of 1811.

rights of common was possible without causing that disruption which their total and sudden abolition would have effected in the agricultural system, into which such services and rights were intimately interwoven.

A series of decrees and laws and regulations from 1811 to the present day has provided from time to time the necessary machinery for carrying out the Edicts, and has also aimed at rendering more complete the transition from the former to the present system. They have been accompanied also by laws providing for the special promotion, with State funds, of such undertaking for the furtherance of agricultural prosperity as should be too extensive and expensive to be carried out by private means, even after the cultivators had been freed from their bondage and burdens. By this two-fold legislation, by this double lever, nearly all the numerous obstacles to the progress of the national agriculture have been gradually removed, so that Prussia has now all but accomplished the task to which she set herself at the beginning of this century. Other legislatio

21. The Prussian legislation (usually so-called) was gradually introduced into those parts of the kingdom, to which it was not at first applied with the exception of the districts on the left bank of the Rhine and of New Pomerania. For these a special law of 19th May, 1851, on the commutation of rights of common was enacted. This law applied the principles of the Prussian legislation, so far as they were needed. In New Pomerania Swedish law, which is similar to German common law in many respects, had already effected many of the changes, brought about by the Prussian legislation, but in such a manner as to cause the almost complete destruction of independent peasant estates. In the Rhine Province on the left bank the French law had abolished all feudal privileges and all services to the lords so completely as to give to the peasants full possession of their lands, with the exception of those held on ground-rents for not more than 99 years, or on terms constituting a similar small estate. Introduction of Prussian legisla into Rhine Provinces, &c.

(B.)—The existing Legislation directly or indirectly affecting Land.

(*a.*)—*The Laws of National Agriculture.*

22. There are mainly and in the first rank the Edicts of Stein and Hardenberg, with all the resulting laws and regulations, which have been under that title assembled by Lette and Rönne, and other Jurists. Their history, development, economical principles and legal principles, are most interesting to study; but it will be impossible within the compass of such a Report as this to attempt to give their due, either to their history or development, or to their economical and legal principles. I shall however endeavour to give a sketch, however brief, of all the chief features of this legislation, in the hope that a more or less accurate outline of the subject will be offered to the reader.

This legislation divides itself naturally into two parts: the laws passed for the abolition of real charges and services, including the regulation of property relations; and the laws passed for the arrangement of rights of common and the inclosure of common lands, and for the consolidation of landed properties. Under the conviction that "all that is common is hurtful to the individual," and that the real strength of a nation is only to be developed by perfect freedom in agricultural organization, these two divisions of the agricultural legislation were steadily pushed forward together by Prussian Statesmen in such a manner, that they have been largely instrumental in making the aspect of agricultural Prussia in the middle of this century, widely different from that of agricultural Prussia at the beginning of this century.

23. The following objects, which chiefly affected the economical position of the peasants, were evidently marked out for the attainment of the legislation initiated by the Edict of 1807:— Objects of Pru legislation.

1. To abolish all encroachments on personal freedom.
2. To abolish all restrictions of rights of property in land.
3. To relieve the peasants from the burden of being the special and sole class for payment of most of the public charges.
4. To abolish the powers of lords of the manor, and to convert peasant-lands into free and absolute property with compensation to the lords of the manor.
5. To commute the real charges and services, resting upon private rights, which were attached to various kinds of landed property.
6. To commute rights of common and inclose common lands, and to facilitate the consolidation of farms and other landed properties.

These six objects fall into the two divisions of legislation above-mentioned. They have never been lost sight of throughout the fifty years of legislation. Whatever the political changes might be, there was never any essential deviation from the task set for

the legislation of the country. It must, however, be repeated that all the credit of the increase of agricultural prosperity in Prussia must not be given to that legislation. The subsidiary legislation which advanced hand-in-hand with it, and the collateral legislation which could not fail to have an indirect or even direct influence on agriculture, must not be forgotten. Of the subsidiary legislation there is a division, which forms an important part of the laws of national agriculture, namely, all the regulations, decrees, and laws providing for draining of swamps, drainage, artificial supplies of water, embankments, and other agricultural improvements. Of this division it is intended to take a cursory view, after examining the other two divisions of the legislation and after referring to the dismemberment legislation and the special procedure. It is further purposed, in reference to the first division, to consider it in its development, in the details of its successive laws, and lastly in its present condition.

(*a.*)—*The abolition of Real Charges and Services.*

ninary review. diet of 1807.

24. The legislation respecting the commutation of real charges on, and the regulation of property in, land is the first in order to be thus treated. The Edict of October 9, 1807, abolished servitude of the person from the day of its issue, and declared that all servitude of the land, or rather for the land, should cease on or before Martinmas 1810. The real charges, which constituted the conditions on which peasants hold property, were maintained. But the concession of freedom to all persons in respect of their possession of land, involved an abolition of the restrictions as to the acquisition and alienation of their landed property. This result of the concession could in the nature of things be only gradually attained. The danger was however imminent that, on the abolition of the obligation to instal proprietary cultivators in the occupation of vacant peasant lands, those lands would be absorbed into the estates of the lords of the manor. This was rendered the more probable by the lamentable fact, that war had depopulated many peasant villages. The Edict provided, therefore, on the one hand that no hereditary properties and no properties on hereditary lease or on quit-rents should be absorbed, but that the rights of the existing possessor might be extinguished by transfer to the lord of the manor by private contract or by the direction of the law. The Edict on the other hand provided for the maintenance of the above obligation in a modified form. The lord of the manor was by the instructions based upon this Edict empowered by the Provincial Authorities to convert such lands into large peasant farms not exceeding certain fixed sizes, as soon as he had secured the complete emancipation of the lands and had satisfied all the claims of former possessors. If the desire of the lord of the manor was to convert such lands into out-lying farms, he had to fulfil other conditions. He was also restricted in this conversion to absorbing only a half of the peasant lands of a peasant village, and was further obliged, if he wished to exceed this half, to lay out in peasant properties an equivalent quantity of land from another part of his estates. Neither could this peasant land be converted into out-lying farms, unless it had not acquired the character of peasant land before the middle of the eighteenth century. The dates vary for different parts of the Kingdom, but cluster around the middle of the century. The important bearing of these provisions cannot fail to be seen.

Edict of 1811.

25. In securing free traffic in land the Regulation Edict of September 14, 1811, went a step further. It provided that the lord of the manor should be discharged from his obligation to find cultivators for the peasant properties on certain conditions. He must enter into a full and complete arrangement with the possessors of such properties by contract or otherwise to part with their rights. The Edict mentions for this purpose properties, in which the occupants had only a possessory right, but which were hereditary or, if not hereditary, were held for an indefinite term, or for a term of years, or for life, upon dues, leases, and services. The position was therefore this: on the one hand was the lord of the manor with his obligation not to annex peasant lands, but to maintain them in the occupation of peasant cultivators and in a condition to pay taxes on them and with his right to certain returns and services; on the other hand, was the peasant proprietor with his obligation to pay certain acknowledgments to the lord of the manor, and with his hereditary right to his property, or with what was considered but little inferior to such an hereditary right. The object was to free each from the trammels of such a system. This Edict, it will be recollected, was the work of Albert Thaer, who sought to produce amelioration of the relations between man and land and to avoid a violent dislocation of interests. He sought for a simple principle on which to base such arrangements. The Edict adopts that of commutation. A balance is struck between the obligations and rights of the one party and the obligations and rights of the other party, and that balance is to be commuted. The balance was against the peasant proprietor, and the commutation of

it was to be effected by a transfer to the lord of the manor, of one-third of the land by the hereditary possessor, and of one-half of the land by the non-hereditary possessor. The home or farmstead, together with its appurtenances and the site, seems generally to be excluded from the basis of commutation. This commutation could also be paid in the shape of a rent-charge. The reason for selecting land instead of money capital seems to have been that the latter was not obtainable, und the former was almost valueless, but at hand. It must also be added that this legal standard of arrangement was not compulsory, but if the interested parties could come to an agreement on other terms, they were at liberty to do so. At the same time the consolidation of intersected lands was allowed.

Opposition on part of lords.

26. The rates of commutation were opposed in many quarters as too disadvantageous to the lords of the manor, who had relied upon their rights to services for supplying the requisite labour to the cultivation of their own lands, and who now feared a dearth of labour. They also pleaded that much of the land had been settled for the purpose of securing the supply of labour. The Declaration of the 9th of May, 1816, accordingly restricted the right to this regulation of peasant property to such properties as were assessed to the land-tax, and had been settled with peasant cultivators in the middle of the last century. All the subsequent laws, till 1850, excluded the smaller Lassitian* ("lassitischen") cultivators from the conversion into indefeasible proprietors. In 1821 the commutation of services was conceded to the possessors of small farms ("Ackernahrungen"). In 1845 it was conceded, also, to the possessors of smaller farms "(Kleine Stellen").

Of Declaration 1816.

Of Law of 184

27. The Law of January 31, 1845, marks another period in the legislation. Thenceforward the rents in money or kind from properties held on hereditary leases, ground-rents, or quit-rents were to be extinguished or rendered terminable by the possessors of such properties. A valuation at twenty-five years' purchase was usually taken for the basis of this species of redemption. For facilitating the redemption sinking-fund societies came into existence and were the prototypes of the rent-charge banks, which are treated of in a section of a subsequent sub-division of this Report.

Of acceleration 1848.

28. The progress of the Legislation was much accelerated by the events of 1848. All parties then united in desiring a speedy abolition of all still existing charges and services. A different and, in public repute, better settlement of the reciprocal obligations became possible. All proceedings under the previous Legislation were stayed, and the Law of March 19, 1849, established certain normal prices and rates for the commutation, which were ascertained by special Commissions. One-half of the members of these Commissions were those entitled to receive, and one-half were those bound to render charges and services. They were elected by indirect voting for this purpose. The instructions to these Commissions were published in 1850, and their action has caused an important facilitation of the later proceedings in matters of commutation.

Of Laws of 185

29. The legislation entered upon its present period at the passing of the Law of March 2, 1850, which treats of the commutation of real charges, and the regulation of the relations between peasants and lords of the manor. This law converts into absolute and free property all those classes of peasant lands with incomplete proprietorship, to which legislation had previously given attention. It distinguishes between real charges and services to be abolished without compensation, and real charges and services to be commuted. The legislation initiated by this law consists of several subsequent laws from 1850 to 1860, carrying out and extending the principles of that law.

It will be desirable in following the succession of laws on the abolition of real charges and services to regard, first, the laws providing for personal freedom and for free traffic in land; and secondly, the laws for the commutation of real charges and the regulation of the relations between peasants and the lords of the manor.

Examination of Edict of 1807.

30. The laws providing for personal freedom and for free traffic in land begin with the Edict of October 9, 1807, with respect to facilitating possession and free use of landed property, and to improving the relations between peasants and lords of the manor. At the outset it must be stated that wherever the Prussian Body of Law, with its subsequent interpretations and judge law has force, thither the legislation in connection with this Edict has followed. That legislation does not obtain, therefore, wherever German common law (as in New Pomerania) has force, or wherever French law (as on the Rhine) has force. The 1st to 9th Clauses of the Edict refer to the possession and use of land, and the 10th to 12th Clauses refer to the personal relations of the cultivators of the land.

This initiatory Edict of the legislation postulates that the welfare of the State is better consulted by the increase and free use of the forces of the individual in every direction than by mere increase of population, which for instance was one, if not the chief, cause of the previous legislation for maintaining the number of peasant cultivators.

* *Vide* Appendix of Definitions and Terms.

ns at free
hange in land.

31. The 1st paragraph of the 1st Clause aimed at securing free trade in land. By it all the restrictions in the Prussian Body of Law as to lords of the manor acquiring peasant lands, as to the acquisition of those lands, and as to the acquisition of privileged lands of the nobles, were abolished. But that free trade is not yet secured, for restrictions on the alienation of lands from *fidei commissa*, feudal descent, and the like are still maintained, and restrictions affecting aliens and corporations are still in force. These latter limitations of free trade in land may, however, be more or less warranted by reasons of policy. The 2nd paragraph also maintained the existing laws as to the legal incapacity of members of certain religious sects to acquire land. This applied to the Jews. But since their emancipation in 1847 they are legally able to acquire land. It applied also to the Mennonites, Quakers and Separatists. They appear to have been since enabled to acquire land. At any rate the equality of all citizens before the law, as laid down in "The Constitution," would now allow them to acquire land, provided they undertook the military obligation of all Prussian subjects, to which those sects seem to have religious objections. It is at the present moment a parliamentary question as to whether the members of these sects should not be compelled to be soldiers like other Prussian subjects.

n
di

bolishes restric-
'e distinctions
rank.

32. The 2nd Clause established free selection of a trade or profession. By it the restrictions in the Prussian Body of Law as to the distinctions made by birth between nobles, townsmen and peasants, and as to the callings that each class could exercise, were abolished.

estricts obstruc-
'e rights.

33. The 3rd Clause limits the exercise both of preference rights of purchase and of prior claims (based upon the law and not on contracts or wills) in respect of land. All such remaining preference rights of purchase were abolished by the Law of March 2, 1850. All such remaining prior claims were also then abolished, with the chief exception of the prior claims of joint-heirs.

rants divisibility
' land.

34. The 4th Clause lays down the fundamental principle of the unconditional division of landed estates with a due reservation of the rights of the real creditor, and also of the rights of pre-emption, referred to in the previous clause. This principle is further developed in the National Agriculture Edict of September 14, 1811, and receives complete application in the Law of January 3, 1845, on the division of lands and the establishment of new settlements.

.oosens strictness
f settled property.

35. The 5th Clause allows the demise of settled landed property in portions or in entirety on hereditary leases. This clause was suspended in 1842, and has now lost its importance by the abolition and prohibition of hereditary leases. The Law of 1850 abolishes the rights of property hitherto residing in the hereditary lessor.

Protects peasant
ands from undue
bsorption.

36. The 6th and 7th Clauses refer to the absorption and amalgamation of peasant estates. The tendency of legislation in Prussia had even before the promulgation of the Body of Law been towards an amelioration of the condition of the peasant, and towards the maintenance of a yeomanry and peasant proprietary. Even in the Electorate of Brandenburg this had been the marked policy of the rulers. In the 15th and 16th centuries the small country towns had petitioned their ruler to protect and maintain the yeomanry and peasantry on commercial and political grounds; on the former, because the nobles traded with the large commercial town, but the yeomanry traded with the small country towns; and on the latter, because it was good for the State and its Ruler too, that the yeomanry and peasantry should not disappear and leave nobles and labourers alone in the State. The Hohenzollerns did not fail to take this view. They directed their policy to a maintenance of the peasantry for the political reason of balancing the powers in the State, for the commercial reason of preserving the towns, for the national reason of augmenting the population, and for the military reason of supplying a soldiery. In 1709 this policy was marked by a strict prohibition to nobles to annex peasant lands.

In 1739 the Provincial Governments were ordered to prevent the eviction of a peasant except upon well founded grounds, and upon the lord of the manor replacing him by another peasant cultivator. In 1749 Frederic the Great prohibited under penalties all absorption of peasant lands. In 1764 the repeopling of peasant farms which had been abandoned since the war of 1756 was commanded under heavy fines. There were similar provisions in the provincial legislations. The Prussian Body of Law incorporated these principles; but the modern legislation has adopted other principles with however the same intention of ameliorating the condition of the peasant. The faculty of absorption and amalgamation of peasant estates was granted on certain conditions. One-half of the peasant lands in any one district could be thus absorbed for outlying farms, and the possessory rights of the owners of such peasant lands were in that case to be bought up. The amalgamation of peasant lands into large farms up to certain fixed sizes was also permitted. The restrictions maintained by the above limits on the disposal of landed property have, however, been since abolished as part of public law. The only legal limits

to such absorption and amalgamation appear now to be the existence of rights at private law.

37. The 8th Clause provided for the charging of landed property entailed as a fief or *fidei commissum* with mortgages for the forced contributions which were imposed as a condition of peace. This clause has no interest now except as a precedent for breaking down in cases of State policy the fence erected around such properties. Charges settled property with war loan.

38. The 9th Clause enacts that feudal entails and *fidei commissa** can be cut off and unsettled by a family agreement. The subject of the restrictions on free trade in land created by feudal descent, *fidei commissa*, and the like is examined in a subsequent sub-division of this Report. Infringes on perpetuity of entails, &c.

39. The remaining Clauses 10 to 12 refer to the abolition of servitude. Personal servitude is abolished at once. The servitude for land is to cease in 1810, and the creation of all such servitude is prohibited. The personal servitude was abolished throughout Prussia without compensation. Stein laid down the inalienability of the right to freedom as a sufficient and equitable ground for withholding compensation. This has been remarked upon as one of the rare instances in which that practical statesman reasoned from first principles. As a matter of positive law no compensation was due, for ultimately the lords of the manor profited enormously, and even immediately they profited, inasmuch as they too received the absolute ownership of their properties which had hitherto been far from free, and on the contrary burdened in many ways. As the services of cultivation were maintained until the relations of peasants and lords of the manor were regulated, the fears of a dearth of labour from the emancipation were not well-founded. Prohibits personal and land serfdom.

40. In concluding this Notice of the Edict of October 9, 1807, it may be recorded that the personal servitude, which had been previously entirely abolished on the Crown lands in East Prussia and Lithuania and partially abolished by contract on Crown lands in other provinces, was forthwith abolished on all remaining Crown lands as on other lands. Abolition of serfdom in Crown lands.

41. The Edict for the promotion of national agriculture of September 14, 1811, is in succession the next law of this part of the legislation. It devotes the first 38 clauses to the removal of all hindrances, other than the dependent relations of peasants and their services which are the subject of other laws, to the free development of the forces of the possessors of land and to the best possible use of the land and soil. The remaining clauses are directed to the promotion of the general extension of agricultural industry. Examination of National Agriculture Edict of 1811.

42. The 1st clause is explanatory of the 4th clause of the Edict of October 9, 1807, and removes all restrictions of public law as to transfer of landed property. Rights at private law, such as the rights of third persons in *fidei commissa* and the like, are not touched. The removal of restrictions does not extend to restrictions on the use of land, but is confined to the entire or partial alienation or acquisition of land. In sub-division of land the rights of third persons are attached to each portion as to the whole. It may not be uninteresting to record some of the restrictions abolished; viz., the consent of the Crown to alienation and acquisition of land, the valuation of peasant inheritances at a fixed tariff, the prohibition to an incoming possessor to give the outgoing possessor such a price as should render him incapable of paying the public charges, the rules as to quantity of cattle on a farm, and the regulations as to mode of farming. Removes public restrictions on transfer of land.

The 2nd clause, which provides for the division of land on hereditary lease in such a manner as not to prejudice the lessor, has become a dead letter by the action of the later legislation, which converts all such properties entirely into absolute property.

The 3rd clause declares that the State taxes and charges shall be no hindrance to the division of land, and mentions the removal of certain hindrances of that nature.

By the 4th and 5th clauses restrictions as to the use of private forests, such as prohibition to subdivide and to cultivate them, are abolished, subject to the rights of third persons; and the restriction, arising out of the State compelling cultivation on penalty of losing the land, is also removed.

The 6th clause relieves the possessor of land from interference by real creditors and heirs expectant and others, as to his use or division of the land, and as to large sales of wood, provided they are in accordance with the provisions of the other Edict. Similarly the 7th clause relieves him from restrictions caused by the injunctions as to settlement on his property of working families, and as to his employment of them. It however limits contracts of hiring to twelve years. It permits payment of wages partially or entirely by the use of land. It disallows all unfixed rents in money or kind.

By the 8th clause aliens are admitted to leases, and by the 9th clause a prohibition to diminish the number of cattle on a holding is altered into a regulation that the number of cattle is not to be regarded so much as the quantity of fodder consumed. This regulation

* *Vide* Section (*a*) of Sub-division (*b*) of this part of the Report.

was one of the results of Thaer's study of English cultivation, but has not been maintained to the present day.

Lessens private hindrances to transfer of land.

43. The previous clauses having treated of the hindrances caused by enactments of the public law, the 10th and following clauses to the 17th deal with the hindrances arising at private law from special relations and services. But such hindrances, although later legislation has widened much the field of its operation, have not yet been entirely removed. As the substance of these clauses is recapitulated with explanations in the Clauses 181, 191, of the Law of 7th June, 1821, it will suffice to point out that a third part of the lands subject to common of pasturage was compulsorily inclosed for private use, and the rest remained in common unless a further separation was agreed upon.

The clauses 18 to 24 treat of hindrances arising out of various rights of common, and clauses 25 to 33 provide for the protection of woods and forests from abuses arising out of right of common.

The clauses 34 to 36 refer to the protection of fields and meadows and plantations from abuses, but are very imperfect, and have been replaced by the provisions of the Agricultural Police (Feld-polizei) Regulations of 1st November, 1847.

Clause 37 subsequently developed into a Law to protect river fisheries.

Adds certain ameliorating directions.

44. Clause 38 provides tor the employment of qualified experts in agricultural suits and disputes. Clause 39 recommends the establishment of agricultural societies; and clause 40, of model farms. The fruits of the two latter clauses are to be seen in the existing development of such institutions. The clauses 41 to 44, so far as they refer to the Agricultural Boards ("Landes Oeconomie Collegien") which they called into existence, are now abrogated by more modern legislation.

Announces promotion of land improvements.

45. The last clause of this Edict declares it the patriotic duty of the State to promote the construction of canals, bridges, and roads, and to do anything possible to open up the national wealth. This declared intention of the State has found its expression in the legislation which forms the subject of the e sub-division of this division of the Report.

Examination of Regulation Edict 1811.

46. The second part of these laws is that of property regulation and abolition of real charges. Although the other Edict of Hardenburg and Thaer, that of the 14th of September, 1811, for regulating the relations between lords of the manor and peasants, has by the later legislation been entirely repealed, it will not be uninteresting to sketch the details of a measure which for forty years formed the basis of this branch of the Prussian legislation. The introductory clauses declare that the object of the Edict is to convert peasant properties into holdings of absolute ownership, and to commute by mutual compensation all mutual obligations and rights of peasant and lord, and that in the meantime no such a peasant has such absolute ownership.

Converts hereditary peasant properties into absolute property.

47. The first part of the Edict then treats of hereditary peasant properties which hitherto have not been held absolutely. These are to be converted into absolute property on compensation to the lord of the manor. Two years are allowed for such a private and friendly arrangement. After that time a claim for such regulation can be made by either party, and in default thereof the State can order the regulation. The following are the rights of the lord to be compensated: the right of property, the claim for services, the dues in money and kind, the farming stock, and the real services. The following are the rights of the peasant to be compensated: the claim for support in misfortune, the claim for wood and other advantages in respect of forests, the obligation of the lord to build and repair buildings, the obligation of the lord to pay taxes and other public dues and services in case of his destitution, and certain rights of grazing. But as some of these rights cannot be easily turned into value, special rates of compensation must be made. Accordingly, the lord shall receive one-third of the peasant's land and all rights and obligations shall cease. But the interested parties may agree upon an amount of compensation to be paid in money capital, or by a rent-charge in money or kind. If no agreement be made, then the lord can demand compensation in corn. If however he demand land, and the peasant refuse to give land, the General Commission is to decide on the mode of compensation. Minute directions as to compensation by land are given in order to avoid hardship to the peasant or the creation of hindrances to agriculture. The house and garden remain without division in the possession of the peasant. But for it and some other advantages the peasant is to pay local taxes and to render certain agricultural services with a fixed maximum of service. The peasant pays a valuation for the farming stock, if it had previously belonged to the lord of the manor. Compensation in capital, in default of any other arrangement, must be paid in corn, the produce in three-field farming of one field being given to the lord, and in other cases one-third of the total produce of the farming. For meadows, experts shall fix the compensation. This regulation of property is to be accomplished within four years. In the meantime the relations of peasant and lord remain as before, unless an earlier arrangement is effected. The

On compensation to lord of one-third of land.
Or otherwise.

distribution of the land tax and other taxes on separated lands is provided for. Although one-third of the land or produce is the rule of compensation, a less proportion can form an exception to the rule, if it can be shown that the value of the rights of the lord and the obligations of the peasant do not warrant so large a proportion.

48. The second part treats of the peasant properties which are not hereditary. These are the properties held for an unfixed period, or for a term of years or for life, on dues, leases, and services. They differ from the hereditary properties, inasmuch as the lord is not bound to recognize the heir of a possessor, and in some cases is empowered to levy higher duties and exact greater services on a change of possessorship, or on a renewal of the possession. But, on the other hand, the lord is responsible for the taxes and cannot annex the lands, but must always find peasant tenants for them. The directions of the first part are applied to such properties with this difference, that the lord should be entitled to one-half of the lands as basis of commutation. The peasants, who occupy only a few morgens of land and render manual services, are to be considered as labourers on outlying farms, and these relations can only be changed by a mutual agreement. A period of four years is fixed for the conversion, with a longer one of six years for East and West Prussia. There are some special clauses with reference to the position of some classes of peasants in Silesia and elsewhere. The position, for instance, of the so-called "Dresch-gärtner" was peculiar. They were not owners of the plots of land they held, but were holders in return for their labour of threshing. The Edict provides for the conversion of the holdings into absolute property.

Converts non-hereditary properties into absolut property.

On compensation o one-half of land.

49. It will be recollected that the Declaration of May 29, 1816, materially altered the scope of this Edict. Thenceforward the conversion into absolute property could only be claimed by peasant farmers. What constituted a peasant farm was defined to be: a farm, (*a*) sufficing for the maintenance of the possessor as an independent cultivator; (*b*) entered in the provincial survey, and paying land-tax as a peasant property; (*c*) established before certain dates at the middle of the eighteenth century; and (*d*) subject, at the publication of the Edict, to the obligation on the part of the lord to keep it tenanted by peasant cultivators.

Declaration of 1816.

Definition of peasant farm.

The second term of the definition was the most fatal of the four. This definition excluded a large number of the peasant properties affected by the Edict. The consequence was that many of the excluded peasants received notice to quit, and their lands were amalgamated with the manorial lands. This definition did not, however, prevent numberless suits as to what peasant properties were excluded, but brought about such dissatisfaction that it helped to render necessary the existing legislation.

Consequent disappearance of peasant holdings.

Other misapprehensions or restricted interpretations to the disadvantage of the peasants occurred, but need not be more fully mentioned. Several decrees and regulations were issued from time to time to counteract such injurious action, until the year 1848 quickened ideas and ripened public opinion for a return to the principles of 1811.

50. Before proceeding to consider the existing legislation, it is necessary to mention the Decree of June 7, 1821, respecting the commutation of services, landemia, and tithes. But this law did not find proper development until the new legislation was inaugurated.

Decree of 1821.

51. It now remains to sketch the outlines of the existing legislation on the abolition of real charges and services, of which the law of March 2, 1850, is the basis and chief expression. It will be remembered that with the Edict of October 9, 1807, the Prussian legislation began to confer an indefeasible title upon the possessors of peasant properties held on Lassitian conditions, and to commute or abolish the real charges thereon. But by the Declaration of May 29, 1816, the universality of this measure was much restricted, and in consequence many peasant properties disappeared. From this divergence from the original path the legislation never entirely returned. But in 1848 the National Assembly took the matter into consideration.

Existing legislatio

Soon afterwards, for the other laws had been suspended, a preliminary law, dated November 19, 1849, was passed respecting normal prices for commutation. In the beginning of 1850 "The Constitution" was promulgated. Its 42nd Article thus laid down the principles of legislation on land:—

"The right of free disposal over property in land is subject to no other restrictions than those of the general legislation. The divisibility of the property in land and the commutability of land-charges are conceded.

"Restrictions of the right to acquire and exercise disposal over real property are only permissible in mortmain.

"Without compensation are abolished all privileges arising out of the former feudal system and out of the former system of taxes and industry.

"The delivery of the full and complete title is alone permissible in the bequeathal of a landed estate; but a fixed commutable rent can be reserved.

"The further application of these definitions is relegated to special laws."

But the special laws have never given the force of law to all these definitions; and, indeed, this Article was itself repealed in 1855, and a less liberal one was substituted, which merely recorded the principles of the legislation of 1850.

Laws of 1850.

52. As has been already mentioned, the year 1848 witnessed a general demand for freedom from the remnants of the old system. The services from small peasant holdings were untouched. The standard for the application of the Declaration of May 29, 1816, varied in different districts. The progress of the arrangement of the obligations and rights of each party was slow, and was obstructed by the many separate laws, decrees, and regulations modifying and remodifying previous laws. Hence, in direct continuation of "The Constitution" three chief laws, consolidating and improving the legislation, were promulgated. The law respecting the commutation of real charges and the regulation of the relations between lords of the manor and peasants, and the law respecting the establishment of rent-charge Banks appeared on March 2, 1850, and the law respecting the real charges attached to the sites of mills on March 11, 1850. To give a complete picture of these laws would require a work in itself. The Ministerial statements of the circumstances and reasons of these laws and the debates upon them are rich in materials. But the limits of this Report permit only of sketching the laws in outline. The law respecting the rent-charge banks is reserved for review in a subsequent section of this Report. The other above-mentioned law of March 2, 1850, shall now be considered. It begins by repealing most of the previous legislation, and then builds up a legislation more in accordance with the principles of the Edicts of October 9, 1807, and September 11, 1811, which had been limited by the Declaration of May 29, 1816, so prejudicially to the lower class of peasants. The law divides itself into four parts, viz., the enumeration of the powers and rights abolished without compensation; the commutation of real charges; the regulation of the relations between lords of the manor and peasants with respect to grants of titles to property; and the general definitions and regulations.

Regulation Law of 1850.

Rights, &c., abolished without compensation.

53. The enumeration of the powers and rights abolished without compensation comprises all those arising from the dominion of the feudal Lords; a number of judicial and other powers originating in the feudal system: dues, which have the form but not the essence of public taxes; various fines, such as fines for keeping cattle or bees, fines on baptisms, &c.; also services of personal attendance; the obligation to sell produce to the lords of the manor; various prejudicial customary rights; and, lastly, all reciprocal services performed for the abolished services and powers. If, however, the services or powers thus enumerated are attached to the grant or alienation of land, then they are not abolished without compensation. An important unconditional abolition was that of the obligation to labour for the customary wages of the district. But quite as important was the abolition of the dominion and the jurisdiction of the lords of the manor and the dues levied on their account. As one consequence, it may be noted that the possession of lands on quit rent or hereditary lease received a complete title to the property. The rights of pre-emption and all prior claims are for the most part abolished.

Real charges commuted.

54. The commutation of real charges is comprised in eleven sections. The 1st lays down the principle of commutation; the 2nd section deals with services. Normal prices are fixed for services rendered by the day. Arbitration is to ascertain the value of services by the piece. Whenever for 10 to 20 years a composition of such services has been paid, that composition is to be the basis of the commutation. Whenever no normal prices exist, arbitration is to be resorted to, as also in cases of commutation of agricultural and building services, to ascertain what services are to be commuted. The 3rd section treats of fixed dues in corn. These are to be commuted according to their price at Martinmas on an average of 24 years without the two dearest and the two cheapest years. A deduction of 5 per cent. is then made to allow for the less value of cereals thus paid as dues. The 4th section appoints arbitration for ascertaining the value of fixed dues in kind other than dues in corn, whenever no composition has existed and no normal prices are at hand. The 5th section forbids the levying of harvest tithes wherever they had not been previously levied, and establishes the average of the compositions paid in the 10 years previous to 1850, or in leases the rent received, or failing these, the estimate of an expert as the basis of commutation. The 6th section abolishes the dues on transfer of landed property whenever the transfer is from proprietor to proprietor, and abolishes all dues except one whenever the transfer is from sub-holder to sub-holder. This due is to be commuted, but can only be claimed three times in 100 years. If the due is payable only in case of death or sale, then the number of times is reduced to two and even one. If the due is a per centage on the value, then an arbitration is to decide as to the selling va e of the whole property. From the value of the lands is to be taken 20 per cent., and from the value of the buildings and stock 50 per cent., the remainder forms the basis fo r commu-

tation. If any commutation had been already paid in capital, that is also to be deducted. The 7th section treats of fixed dues in money which are to be commuted at the annual average. But if there have been any contracts as to such commutation, then, unless he who is bound to pay should prefer the composition in the contract, he who is entitled to receive it is at liberty to demand the composition in rent-charge debentures according to the law. The recourse to the rent-charge bank can, however, be refused by the competent authorities if the rent-charge would exceed two-thirds of the net return of the land. The 8th section refers to all other dues and services. Normal prices are fixed for a few; for others, such as the services of industrial labourers, the yearly value is to be taken, and for all others in default of any other basis a value is to be found by arbitration. The 9th section acknowledges the reciprocal right to commutation for return services of those who are entitled to exact the services to be commuted as above. And the 10th section provides for the deduction of the yearly value of the reciprocal services from such before-named rates of commutation, and also for cases in which the latter may exceed in value the former. The balance is the commutation rent. The possessor of a property of land is empowered to require such a reduction of that rent, if necessary, as shall leave to him the full third of the net proceeds of his property. But previous compositions of dues and services are, of course, excluded from this calculation. The commutation rent-charge can be discharged by payment down of 18 years' purchase. If, therefore, he who is bound to pay that rent-charge declares himself willing to make such a payment, and he who is entitled to receive will not accept it, then the former pays it to the rent-charge bank, and the latter receives rent-charge debentures to the value of 20 years' purchase, with the obligation to pay the annual instalments to the bank. The 11th section establishes the normal prices and normal markets. But before passing to the next part of the law it may for greater clearness be noticed that the payer of commutation, having no capital of his own to offer, would apply to the rent-charge bank. This institution would provide him with rent-charge debentures to the amount of 20 years' purchase for payment of his commutation. For these he would have to pay either $4\frac{1}{2}$ per cent. (interest and sinking fund) for $56\frac{1}{12}$ years, or 5 per cent. for $41\frac{1}{12}$ years.

Conversion into absolute property.

55. The part relating to grant of titles to property is very important, and takes the place of the Edict of 14th September, 1811, and the law of 8th April, 1823. All agricultural plots (belonging to their possessors, not as property nor on quit-rent, nor on hereditary lease, before the promulgation of the Edict of 14th September, 1811, in the respective territories of the kingdom) which had been laid out in accordance with Lassitian rights for cultivation or use, or are charged with dues or services to the lords of the manor, are subject to the regulation respecting grant of title to property, if they are granted with right of inheritance or for a term of years, and if by law or prescription they must be occupied by another peasant farmer on the avoidance of possession. And the distinction between peasant and other lands is no longer maintained. Wherever such establishments exist the law applies to them. The emphyteutic estates, which are for terms of years or are subject to the succession of next of kin in the Province of Prussia, are likewise to be dealt with by this law. Whoever had possession on the promulgation of the preliminary law of 9th October, 1848, is considered as the rightful possessor, a period being fixed for notice by another claimant. A law of 16th March, 1857, fixed the 31st of December, 1858, as the last day for receiving such claims. But only the possessor, and not the tenant to whom the possession may have been let, can be the claimant to regulation of his property relations. The possessor receives, free from paying compensation, the property and the farming stock, and is relieved by commutation for dues and services of all kinds. On the other hand the lord of the manor is, free from paying compensation, relieved from the obligation of supporting the peasant in misfortune and from being the legal representative on insolvency of the peasant cultivator in regard to the public taxes, and therefore from the obligation to pay these taxes, whether or not the peasant paid them to him. He is also released from the obligation to build and keep in repair the buildings, and from certain commutable reciprocal services and contributions in kind. As regards his powers and rights which have a useful value, the lord of the manor is compensated on a fair basis, ascertained by experts or previous compositions or arbitration. As regards his rights and powers the peasant possessor is similarly compensated. But the method of ascertaining this compensation is such that it is only in the case of such possessors of agricultural plots as are entitled to a share in the general harvest, that the lords of the manor have to pay a balance of composition. That method is also so regulated that peasant possessors are not bound to pay a balance of composition exceeding two-thirds of the net proceeds of their property. Whenever there are no claims set up on behalf of such peasant possessions then the complete title vests in the lord of the manor, who can dispose of them and absorb them as he may please. A consolidation of lands must be carried out under official super-

vision in the case of the peasant's lands lying in and amongst the lands of the manor. It must not be omitted to record that, whenever the minerals by the law of the Province belong to the owner of the land, the title to them vests in the peasant proprietor, and lords of the manor who had previously worked them as their own must now pay compensation to him. Also the dwellings of day labourers which the lords may have erected on what is now the peasant's absolute and free property, must be removed at their own expense, if the peasant proprietor demand it.

56 The fourth part containing the general definitions and regulations begins by laying down the principle of the "Constitution," that the delivery of the complete title to it must accompany the bequeathal of a landed estate.

Procedure of Regulation.

57. The initiative in claiming regulation of relations can be taken by either party, and once taken the proceedings cannot be stayed. The costs are divided between both parties. As the evidence of title had in Prussian law passed through various phases, a procedure for facilitating proof of title is provided for the cases in which the mortgage and landed property registers do not contain it. The procedure is to be found in the 109th clause. A number of general regulations complete this last part of the law.

Difference between former and existing legislation.

58. It will be seen from this sketch of the law that, whereas under former legislation the balance of obligations and rights was declared by the State and certain fixed proportions of the peasant's land were separated for the payment thereof as commutation, under the present legislation the balance is ascertained according to circumstances in the presence of the parties and is commuted by payment of capital or rent-charge in money and not by a division of, and alienation of a portion of, the peasant's land for that payment. The land in which the peasant had a possessory right now passes in its entirety into his ownership, and the State provides a machinery for facilitating his payment of the commutation of the real charges and services.

Law on mills of 1850.

59. The Law of March 11, 1850, respecting the real charges attached to the sites of mills has been named in connection with the above Law of March 2, 1850, because its principle of commutation is extended to them, and because these real charges grew for the most part out of the feudal system of lords of the manor. The mill industry was, in fact, an appurtenance of the manor, and a monopoly. The Editors of the Prussian Body of Law seem to have been aware of the possibility of freedom as to the erection and industry of mills; but they incorporated the legal incidents of the existing state of things into their code. Such mills remained, consequently, with their exclusive right to the custom of the district and their obligations to the lord of the manor, till the new agricultural and industrial legislation commenced. When, therefore, in accordance with the principles dominant in the new era, the Industrial Law of 1845 established free competition as regards the industry of mills, these manorial mills found themselves deprived of their rights but still subject to their obligations. Hence arose numerous complaints, and thence sprang up the law now under notice.

Commutation of real charges.

60. All real charges on mills, their sites and adjoining lands, are to be commuted in accordance with the principles of the Commutation Law of March 2, 1850. But the question, as to whether as regards any particular mill-property the real charges were of such a nature as to have been abolished without compensation by previous legislation, is to be decided by the ordinary rules of evidence. All real charges not so abolished are to be forthwith commuted. A special quick procedure is established for the relief of the manorial mill-owners. One essential deviation from the commutation law is, that the possessor of a mill founded since the promulgation of the Industrial Law of January 17, 1845, cannot claim that his commutation rent should not exceed two-thirds of the nett returns of his industry.

Former obstruction industry.

61. The system which obstructed the development of the mill industry is but an example of the system which everywhere repressed the forces of the nation. A delineation of it belongs rather to an investigation of the previous and existing industrial condition of Prussia. But occasional notices of it will obtrude themselves in the course of the present inquiry, whenever that investigation may meet with examples of how that system touched and benumbed the agricultural forces of the nation.

62. The foregoing sketch of the so-called Prussian legislation as regards abolition of real charges and services will, it is hoped, in spite of its brevity and imperfections, give a tolerably good and clear idea of what that legislation was before 1850, and of what that legislation is since 1850.

Gradual introduction of agricultural legislation into Rhine Provinces, &c.

63. It will have been understood that the former Prussian legislation respecting abolition of real charges and services did not apply to the whole of Prussia as she was before 1866. The edicts applied only to the Prussia then on this side of the Elbe. On the other side of the Elbe the introduction of French law had worked, or was working, a similar change in all the countries, some portions of which subsequently became Prussian.

On the left bank of the Rhine the task was nearly accomplished. The French legislation was reproduced. Its details need not be here narrated. But it may be noticed that the capitalization of commutation of charges and services was from twenty to twenty-five years' purchase. On the right bank of the Rhine the legislation progressed sporadically. But when the Kingdom of Westphalia was erected, the change from the old to the new system was manifested by a quick succession of Decrees. In 1808 personal servitude was abolished, and the hand and team services during harvest were regulated. In 1809 the fiefs were converted into allodial lands, and services and land-dues were commuted. In 1810 tithes and some other dues were commuted. In 1811 extensions of previous Decrees took place, notably to the lands on hereditary lease; and the laudemia were commuted. In 1812-13 these laws were explained and interpreted. But these decrees were not so incisive and penetrating as the original French legislation, and the task was not nearly accomplished; so that real charges and services to a large number remained for Prussian treatment.

Rhine.

Westphalia.

Reforms by the French.

The province on the left bank of the Rhine, and many of the territories of the Westphalian Kingdom, fell to the lot of Prussia. In the former, French law still obtains; and the French agricultural legislation has so thoroughly accomplished its task, that the Prussian legislation has no field there for its action. The territories were mainly those which now form the Province of Westphalia, in which French law has had generally to yield the place to Prussian law. The work, though unaccomplished by the French legislation, was so far advanced that the Prussian agricultural legislation found no field there for its action, until it had itself become fashioned after the models of the French laws there and elsewhere extant. It is curious to note that the surprising results in England of the English legislation of the seventeenth century in respect of fiefs and separation of lands pricked Frederic the Great to his praiseworthy exertions to improve the relations of lord and peasant; little successful though his exertions were, for public opinion was not ripe. It is curious to note that from the acts of those exertions, when public opinion was riper, and when a nation's distress required prompt and vigorous measures, sprang up the agricultural legislation. And it is curious further to note that the course of events in France and elsewhere had, as an impulse from without acting upon that legislation, given it at the beginning an acceleration which the Peace retarded. The retardation was such that only in 1850 could the agricultural legislation of Prussia be applied with effect to the territories of the former Kingdom of Westphalia, and that even then it was excluded from the Rhine Province. The Prussian law of September 25, 1820, recognizes the state of affairs in all the territories and provinces in which the French law had obtained. This law was replaced by three laws of April 21, 1825, applying separately to the various divisions of the Kingdom previously embraced by the former uniform law. The one, applying to Westphalia, gives some extension to the principles already dominant. This law repeals all the existing laws on this subject, and then treats of the relations between peasants and lords of the manor. It ratifies previous abolition of personal servitude, personal services, and other obligations. All peasant possessors (except lease-holders) who were formerly subject to lords of the manor, are invested with the possessory right or the absolute ownership of their property. The rights of lords of the manor on transfers of property are maintained. Special regulations respecting woods belonging to peasant properties are given. In most other points the clauses of this part of the law are replaced by those of the Law of March 2, 1850. The following part of the law maintains the modifications of rights and obligations by previous laws, and extends the abolition without compensation to many other dues and services. But the position of fiefs is almost entirely resettled more in their favour. The curious institution of peasant fiefs loses, however, its characteristic features, and they are considered and dealt with as ordinary peasant properties. The land-tax is treated of, and some general definitions and regulations complete the law, so far as it is now valid. The Law of March 2, 1850, completes the treatment of the subject.

Law of 1820.

Laws of 1825.

The other two laws are similar, with modifications suited to the different portions of the Kingdom to which they are applicable.

64. The comparison of French Legislation as developed in the former Kingdom of Westphalia and on the left bank of the Rhine with the Prussian Legislation would not be uninteresting, as it would reveal many a mark of the influence exercised upon the course of Prussian Legislation by the Legislation extant in these territories as acquired by Prussia. Such a comparison is not, however, within the scope of this inquiry. Neither is it desirable to follow further the history of the introduction of the Prussian Legislation for the abolition of real charges and services into the various parts of the kingdom. But the more favourable position of the Province of Saxony in the relations of man and land may be noticed here, as of general bearing upon whatever usefulness this report may

Saxony.

have. Certain territories now forming the Province of Saxony were likewise part of the Kingdom of Westphalia. But though the French Legislation had some influence in them, yet a very different system of relations between peasants and lords of the manor was already in existence. Indeed, for a long time previously, personal freedom had been the rule in the relations of the peasants to the lords of the manor. These possessions were in the main free property. Some possessions were restricted only by some customary services, rents, fines, or tithes. Other possessions were, however, held on quit-rents, feudal-tenure, and hereditary-tenure. In many parts the peasant estates had already been mostly accumulated from free, alienable, divisible, hereditary lands, the so-called changing lands ("Walzenden Grundstücke"). These were originally laid out according to a certain standard of acres and sometimes let on quit-rent, but having no legal connection with the original "close estate" were subsequently sold separately and split up. Later on many subdivisions became amalgamated into one hand. The Prussian Legislation had not so difficult a task in bringing about in that Province a greater freedom in the relations of land.

Magdeburg.

65. Finally it may be noticed that in the Duchy of Magdeburg the feudal incidents of privileged lands ("Rittergüter") had been abolished before the French Revolution.

(β.)—*The Commutation of Rights of Common, and Inclosure of Common Lands.*

Development of legislation on commons.

66. If the knowledge of the Romans warranted the maxim of *communio est mater rixarum*, the experience of Germans has warranted the proverb of "Gesammt Gut verdammt Gut." The hindrances raised by rights of common to agricultural development were perceived, and formed the subject of several more or less imperfect decrees issued by Frederic the Great. But Silesia received a more complete law in 1771 on this important matter. Upon this law are founded the directions of the Prussian body of law in respect of rights of common. Except in Silesia, however, little relief was obtained until the new era of agricultural development was inaugurated by the statesmen Stein and Hardenburg, and the public officials Schoen and Thaer. The commission of which Schoen was a member reported in 1807 in favour of a general law respecting rights of common. Thaer was afterwards charged with the question and the references to rights of common in his National Agriculture Edict of 14th September, 1811, have been noticed in paragraph 43 of this report. He subsequently caused a law to be drafted, but it was not till 1821 that any such a law was promulgated. This law dated 7th June is divided into two parts. The first treats of the abolition of certain rights of common: it defines the rights, settles the power of claiming a division of the property affected by them, establishes the kind of division and separation, lays down the principles of division, and refers to a special procedure. The second part treats of the limitation of rights of common: it provides for powers of use correspondent to the rights of interested parties, and for the withdrawal of a third of the land from the common of pasturage in confirmation of the National Agriculture Edict of 14th September, 1866. This law received only a few modifying explanations during the period between its promulgation and the issue of the law of 1850 which completed this Legislation. Certain other rights of common were brought within the domain of the law of 1821, and certain beneficial amendments were made in that law.

Laws of 1821 and 1850.

67. The two laws of 1821 and 1850 must be examined together, for they practically form one law. Their leading principle is a division of property affected by rights of common and not of rights of common as such. This is accomplished by the commutation of common uses and by the inclosure of common lands. But this settlement of rights of common is not to be carried out prejudicially to the agriculture of the district; hence for instance the usual rotation of crops must be complete before common uses are commuted.

Commutation of rights of common.

Commutation is applied to common of pasturage upon tilled lands, and meadows, and in paddocks, woods and other places; to common of wood cutting and faggot gathering, &c., from woods and forests; to common of cutting heather and the like; to common of mowing grass and collecting of sedges, rushes, or reeds on private lands or from private waters; to common of gleaning from and raking together on reaped fields; to common of collecting resin; to common of pescary in stagnant or private waters; to common of turbary and to some other commons.

As to claiming commutation.

68. Every sharer in a common use is entitled to claim commutation. But a claim once made cannot be withdrawn, or in any manner annulled. The amelioration thereby of the national agriculture or its practical utility warrant the consideration of such a claim. No common use is touched unless its commutation be claimed by an interested party. Parts of the common use may continue to subsist as common. And any number of sharers

in a common use may elect to retain in common that use. From the operation of this law the property of a commune or of a town is excluded, for its clauses only apply to the property of individuals.

69. The commutation may involve for purposes of consolidation a bringing, so to speak, into hotchpot of the lands of the claimants, and of all lands subject to the use. This worked harshly in some instances, although the object was to secure for each interested party a compact farm. A later regulation therefore declares, that so far as the above proceeding results in an allotment of land, which can only be effected by exchanges, one-fourth of the possessors of the lands affected by such necessary exchanges must be agreed. And, if within the next twelve years no recourse has been had to the Special Procedure Authorities in respect of such a commutation, involving consolidation of lands, then a majority of the interested parties must be agreed. Consolidation.

70. The rights of parties entitled to common property or to common uses are ascertained by the evidence of laws and bye-laws, customs and contracts. Detailed directions are given for ascertaining the basis of commutation. The value of a use is defined as its local and customary value. As to common property the rule is that each interested party should be compensated by shares of land. A compensation in rent-charges is awarded whenever lands to the estimated value of his uses cannot be granted to an interested party. It is also awarded in respect of common of collection of resin, in respect of common of pescary, and some other commons. The rent-charges are commutable. Formerly they were paid in money, varying in amount with the fluctuating price of rye, and commutable at twenty-five years' purchase. Now they are fixed in money, and commutable at twenty years' purchase, in default of any other basis being accepted. Some dues in kind, and customary services in labour for agriculturul purposes can be reserved for at the longest twelve years in aid of the deficiencies of the cultivation of the district. Lands cannot be divided unless on such division they lose nothing in value. If this would be the case, or if their utility would be greater in one hand, then they are to be sold by public auction. An endowment of the district school, destitute of a greater share in the common property, must for the benefit of the schoolmaster be effected on the first extinction of rights of common in the district by a grant of so much garden-land in a suitable position, as will suffice for the housekeeping of a family of husband, wife, and three children, and for the fodder of two cows. Modes of commutation.

The decision in all matters of rights of common is referred to the Special Procedure Authorities. It is not necessary to notice here the many legal incidents special to this extinction of rights of common, the consideration of which completes the 1st part of the Law of 1821. Neither is it necessary to refer to the details of the 2nd part, for it treats chiefly of restrictions of common uses in the sense of the National Agriculture Edict, which are seldom applied, for the complete commutation of them is preferred.

71. From the foregoing brief analysis of the Laws for Abolishing Rights of Common, their obstructive nature may be seen, and the scheme for their removal can be seized. The equitable aim of this part of the legislation is so evident, that it need not be pointed out. Few other countries have so justly commuted the rights of common belonging in many cases to their poorer classes. The beneficial effect of combining with such commutation of common uses a compulsion to consolidate the lands is also obvious.

72. This is the Prussian legislation, properly so called, which is valid wherever the Prussian body of law obtains. But a similar legislation had not been previously to 1851 introduced into the Rhine Province and New Pomerania, where the dominion of French law in the former, and of the common law in the latter, had prevented its introduction. When the faculty of commuting common uses became much extended by the law of 1850, it was deemed necessary to apply the Prussian legislation to them. Accordingly, on May 19, 1851, laws for these territories on rights of common were promulgated. Introduction into Rhine, &c.

73. The only essential deviation from the Prussian Legislation is in omitting the compulsion to consolidate. This compulsion to consolidate was unnecessary in New Pomerania, as the consolidation of intersected lands had been rendered admissible by a decree as early as in 1775; and in the Rhine Province it was impracticable, for the disinclination to submit to the directions of a law for consolidating lands remained as strong as it had always been. No consolidation clause.

74. The application of the law as regards lands affected by rights of common is restricted to lands which are used in common without division. Hence certain districts with land in common, but with the land divided amongst the common owners, are not affected by it. The procedure is before the ordinary tribunals, with however modifications which do not contradict the leading principles of the usual procedure. In this particular too it differs from the Prussian legislation, and for this reason, the work to be accomplished was not such as to require special machinery. Exceptions to law

nsolidation of
nds.

75. As the consolidation of lands is an important subject, the Prussian Legislation on it demands a little more notice. Its germ is to be found in the 64th and 65th clauses of the Decree respecting Commutation of Rights of Common. These provide permissively for the bringing into hotchpot of other lands than the lands affected by rights of common. In 1834-38 the consolidation become more or less compulsory on the ground of agricultural advantage, and of the frequent impossibility of carrying out a commutation of rights of common without such consolidation. In the case of regulating peasant properties the consolidation is compulsory. The following is the 86th clause of the law of March 2, 1850, on the regulation of the relations between peasants and lords, and on the commutation of real charges and services :—

"If lands belonging to peasant properties lie separated amongst and intersected by lands of the lord, a practical consolidation can be ordered. In a division of a common use, the lands not subject to a common use, but belonging to a property to be regulated by this law, can be introduced into the plan of the arrangement against the will of the possessor, and can be subjected to consolidation."

This legislation is however meagre, and is by no means as complete as that in Austria or at any rate in Moravia, where a special law on consolidation of lands apart from rights of common or any other matter was passed in September of last year. But the objections of Prussian Rhineland to consolidation seem now to to be vanishing, perhaps partly by the influence of the success in neighbouring countries of such consolidation, and partly by the growing conviction that intersected holdings are less profitable than compact holdings. Certainly no part of the kingdom requires more urgently such a law, for the very small holdings in it and their separation and intersection are well known. To remedy these evils a partial law was passed on the 5th of April in this year, applying the principle of limited compulsory consolidation apart from rights of common or other matters to the provincial district of Ehrenbreitstein. Of this law the first clause enacts that the agricultural consolidation of lands shall on the requisition of owners of more than one-half of the area assessed to the land tax take place, provided also the amount of land tax represented by such owners shall exceed the half of the total of the land tax of the district. But according to clause 2 the agreement of all interested parties is required in order to bring certain categories of property into the exchange, such as buildings, house gardens, parks, &c., such as chalk, sand, and lime pits, quarries, coal pits, &c. The 3rd clause applies to such consolidation the provisions of the Prussian Legislation The 4th clause declares that the exchange shall be carried out in land so far as may be possible. The 5th clause permits

hrenbreitstein
w.

that no compensation in exchanging of land which shall render necessary an alteration of the mode of agriculture on the farm shall be forced upon a proprietor. An arable farm, for instance, cannot be thus changed into a dairy farm, nor even a chief branch of the agricultural industry of a property be thus endangered ; nor can a team-requiring farm be thus converted into a hand-labour farm, or *vice versâ*. The 6th and 7th clauses contain certain formal regulations. The 8th clause restricts the share of the occupier or leaseholder to the use or usufruct of the exchanged lands, and regulates the compensation of such limited interests, and defines the position of lessor and lessee. The 9th clause extends the operation of the law to the department of Wetzlar, under the direction of the General Commission in Cassel. The last clause abolishes all restrictions whatsoever in the provincial district of Ehrenbreitstein upon the divisibility of the land. It will be attempted in the fifth part of this report to give some idea of the practical working of this law. It will also be remembered that whatever there may be of interest in the New Provinces, in respect of consolidation of intersected lands and of rights of common, will form the subject of a brief supplementary report.

(γ.)—*The Dismemberment Legislation.*

s development.

76. Before proceeding to an examination of the existing system of special procedure, provided for carrying out the foregoing laws, it will be desirable to look at the chief details of the so-called Dismemberment Legislation. This part of the legislation sprung up from the necessary separation and division of lands which was involved in the 4th and 7th clauses of the Edict of October 9, 1807, and in consequence of the dominant principles of the freedom of trade in land belonging to the new era. It grew through the clauses of the National Agriculture Edict of September 14, 1811, the Decree of June 7, 1821, and the laws of April 21, 1841, into its present completeness, as manifested in the laws of January 3, 1845, of March 3, 1850, of May 24, 1853, and in several minor subsequent laws. This legislation for the dismemberment of land overrides for certain purposes all private arrangements and settlements, but is in all cases scrupulous as to interests of others.

77. It accords throughout with the principles of the Edict of October 9, 1807, with respect to the free powers for division and sub-division of landed property. But feudal estates and estates in *fidei commissa* formed general exceptions to the rule when the separation of portions or sub-division was desired only for private reasons of interest. There were were also till 1850 several special exceptions in respect of peasant estates in some parts of the Kingdom, which were either indivisible or of which the divisibility was subject to the consent of interested parties. There appears to be only one existing special exception, an exception which prevents peasants, whose lands held on a ground-rent have not yet been converted into holdings of their own free property, from exercising that right of sub-division. This dismemberment legislation supplies the method for apportioning the local taxes and rates, as well as the taxes of the States. The circulars of July 1857 and December 1861 contain full explanations and interpretations of the apportioning of local taxes and rates, the principle being that the incidence of taxation on the small separated property should not be greater than on the large and previously undivided property. That legislation also facilitates the exchanging or the selling and purchasing which the consolidation of a property may render necessary, and regulates the adjustment of the claims of real creditors. Its details.

78. With regard to this legislation it may be noticed, that several obstacles existed to the accomplishment of its aims. Not least of them was the land tax, of which the obstructiveness from its diversity and imperfections was proverbial, but this obstructiveness has been lessened by the provisions of the law of February 24, 1850. Another was the contradictory system of local taxation, which a reformed communal system alone could remove. Obstacles to it.

79. The clauses 2 to 24 of the Law of January 3, 1845, treat of the legal incidents of the division and sub-division of land, as to apportioning of taxes, rights of others, &c. The clauses 2 to 5, referring to the form and validity of the contracts, have after a short period of abrogation been replaced by the clauses 2 to 5 of the law of May 1853, which practically re-enact the former. The other clauses are for the most part in force, and so far as procedure is concerned, they seem to correspond to that of the Special Procedure Authorities. It must, however, be added that the restrictions imposed by the legal incidents of dividing land in this law are much diminished by the law of February 24, 1850. Yet as possession for a year and the personal attendance of the purchaser at the locality of the land are conditions of exercising the powers under this legislation, its tendency is to diminish trafficking in land. Law of 1845.

80. The clauses 25 to 32, treat of the establishment of new settlements. By new settlements is meant the erection of dwelling-houses or farm-steads by purchase, or otherwise on separated independent portions of land on which no such buildings previously existed. The dwelling-house may be of the lowest type, but permission for the erection is all the more requisite. Indeed, the clauses of this law not only provide for proper police superintendence and the obligations as regards the commune church and school, but seem directed at excluding squatters, for a notoriously destitute person would not be allowed to settle. A settler must prove himself capable of keeping body and soul together by his plot of ground, or by a mill, or the like upon it, otherwise he would be refused permission to settle. It seems that the evils, against which this power of refusal is directed, made themselves much felt first in Westphalia. In fact many of the complaints against sub-division of land were based upon the fact of the springing up of such squattings. The poorest people could only get the cheapest land. Hence they settled at the outskirts of distant forests, and on lands far removed from the district of any community, or church, or school, consequently they were withdrawn from police supervision and the usual influences of a community, church, or school. Too many settlers of that kind took to theft and other lawlessness; but on the other hand it was not denied, that such persons had often settled on uncultivated and unpromising land, built mud huts, and laboured with such diligence and activity, that from so small a beginning flourishing districts had arisen. This law, taking these things into consideration, requires the co-existence of two reasons for refusing authority to such persons to settle. There must be danger for the community and the police supervision must be trammelled by unusual difficulties; both must exist to warrant a refusal. In case of unauthorized settlement the authorities could destroy the erections. The clauses 31 and 32 refer to colonies and to laying out districts; this form of sub-division is only subject to the necessary supervision of the Authorities. The costs of experts employed under the legislation are also fixed by law (clauses 2 and 3 of the law of costs of April 25, 1856). As regards the cost of action under this legislation it may be observed, that a leading object of the legislation has been to make the costs as small as possible. New settlements.

(δ.)—*The Special Procedure in matters of Real Charges and Services, and of Rights of Common.*

81. It will render more complete the sketch of these parts of the Prussian Agricultural Legislation to fill in an outline of the special machinery for carrying out their provisions. It has been already incidentally mentioned that a special procedure in such matters was established. This is based upon the Law of June 20, 1817, which indeed constitutes, with a few suppplementary laws, the legislation on the subject.

Authorities.

82. The Ministry of the Interior was, before 1848, and the Ministry of Agriculture has been since 1848, the executive organ of this legislation. Under it are the General Commissions and the Appeal Commissions, who are co-ordinate authorities. The sub-officials of the Provincial Government, and the Tribunals of Appeal, are also charged with affairs coming within their domain. The Appeal Commissions, of which there were formerly five, but recently only one, consisted of five specially qualified members, and formed Courts of Second Instance. The General Commissions consisted of an agricultural expert, and a lawyer with special knowledge of agricultural subjects, and formed Courts of First Instance. Under the General Commissions were Special Commissioners. At first these were practical agriculturists, but latterly they have been legally qualified persons with special agricultural knowledge.

Procedure.

83. The procedure is briefly this. A claimant sends in a requisition to the General Commission, which is delegated to the competent Special Commissioner. All formalities and conditions as to status are those of the ordinary procedure. Proof of title was at first required for every kind of claim, but is now restricted to claims involving the receipt of commutation capital. As to outward form of the procedure the General Commissions have full powers. Whenever disputed points affecting an individual must be settled antecedently to a winding up of the proceedings, a decision on the special subjects before the Commission can be taken *ad interim*. The Special Commissioner is bound to obtain an opinion as soon as possible, and in as simple a form as possible, in respect of rights of common as to the value of the whole subject of commutation, and the share of each interested party; and in respect of real charges and services as to the estimated value of those appertaining to either party. For this he is to call in experts. A survey must be made whenever it may be necessary. Arbitrators can be called in to decide disputes as to value. But the great object of the special procedure is to ensure the quickest solution of the questions. The record of the decision must be full and explanatory of all points, and of the reasons for the conclusions in the decision. In matters of rights of common the decision can include plans for new roads, ditches, &c. As to carrying out the decisions, there appears to be a power reserved to the General Commissions to put a plan into execution on behalf of an interested party who may demand it, without awaiting the result of an Appeal on any points to the Appeal Commissions, if it is clear that he would suffer prejudice by the delay. The execution of the decision is completed by handing to the possessor the surveys of their awarded lands. Then follows the official declaration of the rights of all parties, which is signed by those interested in the decision. With a few exceptions, concerning agricultural improvements on the lands, the matter then reverts to the ordinary tribunals for decision on disputed points which may subsequently arise. The costs are in general paid by all the parties, but the State pays the General and Appeal Commissioners, and grants exemption from stamps and fees in matters of mortgages. The costs, however, which are caused by any enlargement of the special question to be decided are to be borne by the parties interested in it. In the commutation of rights of common the costs of survey and the like are to be borne by all in proportion to the advantage obtained by each. In the commutation of real charges the costs are shared.

Thaer's view of such procedure.

84. In concluding this epitome of the laws establishing the special procedure, it may be recalled that Thaer had rightly conceived the impossibility of subjecting such varying matters as the regulation of property relations, the commutation of real charges and services, and the extinction of rights of common to an inflexible form of procedure and an unvarying definition of powers, and had insisted that such fixity would be most prejudicial. From that epitome, too, it will be seen that the authorities for the execution of the laws were left in accordance with Thaer's opinion unshackled by unbending rules of procedure or unchanging principles of decision.

But this epitome cannot be concluded without mentioning the name of the late Dr. Lette, who, till the day of his death in last year and for so many years, held the presidency of the Board of Appeal in special procedure at Berlin. There has been no need for special reference to Stein and Hardenburg, as great personages of the era of free agricultural organization. But if it has seemed desirable to refer to others and especially to Albert Thaer as personages of note, for their share in the great work of the earlier

period of the legislation, it is also imperative to refer to the late Dr. Lette for his share in the great work of the later period. He certainly yielded to no man in having the interest of his country at heart. As President of the Board of Appeal his great merit lay in his perfect independence of character and his strict impartiality of judicial decision. He was always the judge, and held the scales of justice with a firm hand and an even balance. Unswayed by political partisanship he was, whatever his politics were, as truly liberal a man as his country has produced. To him mainly the opinion of a grateful country attributes the continued success, in spite of many a difficulty, of the judicial administration of the National Agriculture Legislature.

(e.)—*The Legislation for Land Improvements.*

Its development.

85. This legislation comprises at its earlier period most of those land improvements which are, in the main, wisely left to the action of the gradually developed forces of agricultural activity, and establishes, at its later period, principles of self-help, with the novelty of compulsory enactment for the promotion of land improvements. Improvement of the land is often an almost imperceptible process; the minute labour of the many can only be subsequently known by the aggregate result in the additions made to the national wealth. But the greater works are at once patent. It is to them only that the State may find it necessary to give a helping hand. In this sense Prussia seems to have legislated. But at first she applied that requirement of assistance on the principle that the State should itself undertake large works of improvement. The earlier undertakings by the State, amongst which the draining of the twenty-two square German miles of the Havel Bog is conspicuous at the beginning of the last century, need not be here noticed, nor need that undertaken by Frederic the Great for the improvement ot the Oder Bogs, of which the lower ones were in 1832 also drained. Many other improvements took place or were commenced in the period from the beginning of the reign of Frederic the Great to the promulgation of the Prussian Body of Law. This code, while recognizing the progress already made and giving a better legal system to some kinds of improvement, surrounded others of a greater importance with many difficulties, which could be seldom removed. The National Agriculture Edict, however, reverted to the idea of the Crown commanding works of improvement, and recognized many necessary undertakings as exceeding the force of individuals, and as therefore to be performed by the State. Then followed in the course of the next fifty years many a law for the improvement of the land.

Law on Reclaiming Land of 1811.

86. The Law of November 15, 1811, for reclaiming land marked the beginning of the change of system and of the introduction of new principles. It initiated the law as to works of draining, &c., and created a simple and practical administrative procedure for such works. In particular it regulates the damming of water for mills, so as not to prejudice the rights of others. It makes the clearing out of ditches, &c., subject to orders from the police. The principle of expropriation is applied, and accordingly a dam or even a mill can be removed on payment of full compensation, if the improvement of navigation or of agriculture can thereby be promoted. For similar reasons trenches through the lands of other owners and also from stagnant waters can be cut. But there is no period of limitation fixed for barring the preference of claims, &c., and in this respect the beneficiaries under this law are not in as sure a position as those under the law now to be noticed.

Irrigation Law of 1843.

87. The law of February 28, 1843, respecting the "Utilization of the Private Rivers," marks a yet greater advance. It was the result of a general demand for facilities of irrigation, on which subject Thaer had long before held up as a striking example of the results of irrigation the system of irrigated meadows in Siegen (a department of Westphalia), where since 1790 the law had recognized a traditional principle of association in common of all owners along the banks of a stream for purposes of irrigation. The question as to what is a private and what is a public river seems to be as much disputed in the domain of the Prussian body of law as in the domain of most other systems of law—not excepting the French.

A public river is however generally held to be a navigable river, and may be extended to mean a raft-bearing river. Hence this law applies to all other rivers and streams, with the exception of streams owned exclusively by one owner, and of streams subject to provincial laws or bye-laws or entitled to exemption from any other special legal reason. It grants to every landowner on the banks of a private river the right to use the water for his private advantage, providing his damming of the water do not extend beyond the boundaries of his own estate and do not cause flooding, and provided the water be reconducted to the river without encroaching upon the neighbour's land. Several owners can unite in carrying out a work of irrigation over their lands as in one estate. If

the opposite banks of the stream are occupied by different landowners, then the water is shared. No special permission is required for such works of irrigation, but neighbours, manufacturers, and others can make good their objections, and the State can interfere for the public welfare. The landowner can, however, guard against such objections and such interference by previously submitting his plan for the approval of the departmental council, and announcing it in the local journals. After three months the raising of objections would thus become barred. But, if it be of paramount interest to the national agriculture, the landowner can meet objections in another manner, and even encroach legally upon the property of others in spite of their objections. He can require, on payment of full compensation, that the necessary water conduits so far as they cannot be opened out on his own estate shall pass with right of way through the lands of another owner; that his dam shall reach to the opposite bank; that a certain injury to neighbours by back water, or flooding shall be allowed; and that the owner of machinery driven by water shall submit to a restriction of his right to water. For a similar paramount reason the landowner on the bank of such a stream can cede to neighbouring owners his right to the utilization of the water. In all such cases certain departmental authorities elected from the departmental council are empowered to try to reconcile parties in dispute as to the exercise of the above powers, and on failure, to decide as to the existence of such a reason of paramount advantage, with an appeal, however, first to the Provincial Government and then to the Ministry of Agriculture. For investigating the projects, to which the existence of this preliminary reason is conceded, Commissioners are appointed by the Provincial Government. They examine the plan, lay down conditions, and fix the compensation by aid of appraisers (adding 25 per cent. to their estimates) respecting the amount of which an appeal lies to the Board of Appeal in Berlin. In carrying out this united encroachment on the rights of others for the public good, and for the direct private advantage of a landowner, the law gives many directions for the purpose of avoiding harshness, and for the purpose of converting such undertakings as much as possible into undertakings in common.

Allows legal encroachment.

Compels works of improvement.

88. Lastly, it must be noticed that in its third part this law provides for the creation of Associations at the will of the State for making improvements. It declares that, whenever the utilization of water for irrigation would be of advantage to a whole neighbourhood, but can only be carried out by the united action of all the owners of the district, then the executive of the Crown shall command the construction and maintenance of the work, and shall order for that purpose an association of the landowners. If such associations are voluntarily formed, their Articles of Association are approved by the Ministry of Agriculture. If they are ordered, then the Articles are approved by the Crown. It will be observed that no special procedure is provided for carrying out the law, and in this respect the irrigation beneficiaries had not the same advantage as the beneficiaries under the law for reclaiming land.

Marks an advance.

89. The foregoing law has been treated with rather more detail than other laws appertaining to this branch of the agricultural legislation, because it certainly marks a great advance in ideas as to the relative rights of the State as representing the community, and of private individuals as parts of that community. This law follows the law of November 15, 1811, in allowing the interest of one individual to override the rights of other individuals whenever that interest accords with the national welfare; but this law goes further, and, for what may certainly be dignified with the designation of reasons of State, compels the performance of works of improvement by the parties to be benefited. The law in fact declares, that the State on behalf of the whole community can disregard the obstructiveness of the individual.

Assimilation of laws.

90. In 1846 the legal incidents of reclaiming land and of irrigating land, began to be assimilated, and the period of limitation as to claims was extended to the former. In 1853 the principle of compulsory association was also extended to the former, and the principle of carrying water-conduits through the lands of other owners was extended to the system of sub-soil drainage by the law of May 11 for Hohenzollern. This latter extension of the legislation for land improvements does not yet appear to have been extended to other parts of the Kingdom. Probably the experience of sub-soil drainage in Prussia is not yet sufficient to warrant such extension.

Dyke Law of 1848.

91. It must be recorded that as early as 1842 the draft of a general "Water" law was drawn up and advocated in an able memorandum. The plan however fell through as a whole, but parts have from time to time become law as separate laws. Of these was the previously noticed law for the utilization of private streams. Another is the law of January 28, 1848, upon the system of dykes, which was issued for the whole kingdom, irrespective of the dominant system of law in various parts. This law is in fact a necessary supplement to the law for reclaiming land, and concedes to the long existing Dyke Associations that

improved and practical legal position with which later associations had been invested. It compels under survey of the Crown the maintenance of the dykes, private or otherwise. It further recognizes the principle of compulsion in works of land improvements, and obliges all interested parties to erect any new necessary dykes, and to maintain them at their cost in common. The obligation to the dyke-rate cannot be barred by any lapse of time.

Compels new dykes.

92. This branch of the Prussian agricultural legislation would not be complete without recording the law for the cultivation of forests, of June 1, 1854, for the Department of Wittgenstein. This is an attempt to extend the legislation on land improvements to the utilization of wastes and bare places by plantations of woods. It provides for thus planting all such lands hitherto not brought into tilth, and adopts the principle of compulsory association, limited however by agreement of a majority of the interested parties. The lands are designated out-lying outer lands (Aussenländereien), and are mountain-lands belonging to neighbouring farms or villages or towns, subdivided into portions of half-an-acre to seventy acres and forming independent holdings. The law seems to be modelled after the example of the associations which in some parts of the Rhine Province and Westphalia have long existed for such plantations and traffic in wood in common. Some of these associations appear to have existed from time immemorial, and to form a remnant of the ancient system of common use and cultivation which obtained so widely in the Rhine districts. In these districts, which have received the system by tradition, there are now regulations and laws for this purpose of forest cultivation. But this portion of the Prussian legislation has not been extended to any other parts of the kingdom. The draft of a law for compelling forest cultivation has, however, just been introduced into the Prussian Chambers.

Forest Law of 1854.

93. The legislation for land improvements has been also applied to the Rhine Provinces. The French law, as introduced at the beginning of this century, provided for irrigation, and a special law in 1803 provided for reclaiming land, and for the regulation of dams. The comprehensive law of 1807, upon dykes, draining of marshes, &c., has been little used in consequence of its complicated procedure. In January 1845 the law of 1843 upon the utilization of private streams was extended to the Rhine Provinces. In October 1846 the Meadow Decree, based upon the principle of the meadow system of Siegen, was issued. It gives a complete legal status to the Siegen Associations, and differs from the law for Irrigation Associations by the absence of compulsion, except on the agreement of the interested parties to form Meadow Associations, and also in the provision of a consolidation of irrigated meadows in common, on the agreement of two-thirds of the interested parties, according to holdings and owners. In 1859 the provisions for reclaiming land were applied to the Rhine Provinces. And whilst this legislation was introduced into the districts subject to French law, it was also introduced into new Pomerania and Rügen, which are subject to German common law.

Applied to Rhine, &c.

Irrigation Law of 1845.

Meadow Decree of 1846.

Reclaiming of Land Law of 1859.

94. Finally, it must be noticed that during the later period of this legislation the State has adopted the principle of giving aid by advances to works of improvements. It has thus expended in the 17 years, from 1850 to 1867, about 500,000*l.* sterling. The greater portion (370,000*l.*) of this has been provided by annual votes during the 17 years, varying from 7,500*l.* to 30,000*l.*, to a fund at the disposal of the Ministry of Agriculture for Land Improvements. Since 1853 the repayments of such advances have been handed over to a section of the Treasury, charged with the management of a Fund of Repayments for Land Improvements. From this Fund loans are again made, and in this manner some 30,000*l.* have been advanced.

State loans.

95. In Prussia as elsewhere the State seems now to have wisely resolved to help those who help themselves, but it also compels them in some cases to help themselves. Instead of carrying out large undertakings it now seeks to quicken the activity of the individual, to give him every facility, and to assure him of pecuniary assistance by means of advances. It also seeks to give to works of land improvements the best possible credit. Hence, for instance, the creditors of such a work have a claim prior to mortgagees upon the benefited lands. Another facility is the power to the associations to issue a fixed maximum of debentures to bearer, with a fixed rate of interest and a plan for a sinking fund. At first, the State guarantee was added, but is no longer required. The State loans are usually at 3 per cent. interest, and 2 per cent. sinking fund, with a free period of 3 or 5 years. The State also usually provides the cost of the preliminary surveys and plans. When the undertaking is very large and embraces many districts, Administrative Commissioners are appointed to superintend the carrying out of the scheme.

Self-help, and compulsory.

Means of facilitating improvements.

It will be perceived from this sketch of the legislation for land improvements, that this branch of the agricultural legislation must be credited with a fair share of the agricultural progress effected since the beginning of this century.

(ζ.)—*The auxiliary Legislation.*

96. A short notice of the various ways in which the national agriculture has in Prussia been promoted by what may be termed auxiliary legislation, will not be out of place in this investigation.

Land tax.

Although it is scarcely an object of auxiliary legislation, yet as it is auxiliary to agriculture, the improvement of the land tax, which had become proverbially oppressive, must certainly be named here, for the development of the Prussian national agriculture has not been unaffected by the influence of the Land Tax. This tax was most diverse and unequal. In Posen, for instance, it was till 1844 based according to regulations of the ancient Slave period partially upon the number of chimney flues, and hence gave rise to numerous difficulties on the dismemberment of a landed property, for the house and its flues were not likewise dismembered. In 1820 the new tax legislation endeavoured to render equal the incidence of this tax, and consolidated various taxes into one uniform land tax. But it was not till 1861 that the Land Tax was established on a fairer and better basis. The legislation of 1861 found as regards lands twenty chief systems of land tax and a hundred various kinds, and as regards buildings a great multiplicity of systems; and it had also to deal with great inequalities in the proportion of land tax paid by each province. This legislation fixes the tax on dwelling-houses at 4 per cent., and on other buildings at 2 per cent. of the value of the use, and provides that the aggregate amount of the tax on lands shall be a fixed sum, to be distributed proportionately amongst all real estates in the Kingdom according to their ascertained value. The classification of land is founded upon the mechanical analysis of the property, *i.e.*, an analysis with regard to the kinds of soil and the kinds of cultivation, &c. The legislation also abolished, with compensation, certain exemptions and privileges. The object of this legislation on the land tax was twofold, viz., to equalize the incidence and to render the ratio of incidence correspondent to the ratio of incidence of taxation on other kinds of property. This is too brief a sketch of so interesting though difficult a question as the Land Tax.

Geometrical survey.

97. But a great benefit of this legislation has been the more or less complete geometrical survey of the kingdom. It has not only caused the inequalities of taxation to be redressed, but it has enabled the owner to estimate more accurately the value of his property, and in this manner it has tended to increase real credit.

Agricultural technical institutions.

98. Ranking in such auxiliary legislation are the measures taken for instruction in, and improvement of, agriculture itself. By such measures the agricultural technical institutions have been established for the purpose of combining theory with practice. It will be recollected that this mode of promoting agriculture was mentioned in the Edict of 14th September, 1811. They date mostly from the issue of instructions in 1848, and are under the supervision of the Minister of Agriculture. They exist since 1850 at Eldenau, and since 1847 at Bonn and at Proskau. One was founded by Thaer in 1806 at Möglin, and a fifth existed at Regenwald. But some of these have disappeared.

Agricultural associations.

99. By such measures the Agricultural Associations were called into being. These are a direct result of the Edict of 14th September, 1811. They are numerous, and work in connection with the Agriculture Board (Landes-Œconomie Collegium) in Berlin. They aim at the promotion of agriculture in general, and also of certain kinds in particular. They make their own Articles of Association according to the object they have in view, and the wants of the district, but the Articles require or required assent of the authorities. They are mostly supported by voluntary contributions, but some receive assistance from the State. Others, again, have received endowments in various shapes. In 1838 there were eighty-eight such associations, whose chief aim was to secure the perfection of the art of cultivation.

Model farms.

100. By these measures also model farms have been created. These were permitted in 1809, and detailed regulations were issued in 1811. The National Agriculture Edict of 14th September, 1811, ordered the establishment of such model farms in each province, and set apart funds for their maintenance. These measures have, however, not yet received any corresponding result, partly, it is said, from failure of funds, and partly from want of competent directors for such farms. But the chief reason seems to be that model farms are a mistake. There are, notwithstanding, such farms chiefly in the Province of Prussia.

Other aids.

101. Mention must also be made of the special pecuniary assistance given by the State to several of the provinces. Such was the subsidy to Pomerania of 110,000 dollars in 1802. Loans were, by means of it, advanced for making improvements on mortgage to corporations and owners of privileged lands without interest, but without annual payments after three years of 4 per cent. to the sinking fund. In 1849 the reservation of this benefit to privileged lands was abolished, and the annual repayments were made into $3\frac{1}{2}$ per cent. interest and $1\frac{1}{2}$ per cent. sinking fund. A similar subsidy of 300,000 dollars to the

provincial district of Köslin in 1846 is devoted chiefly to the promotion of agriculture on the smaller peasant-holdings. These subsidies seem to have constituted the beginning of the institution of loan funds ("Hülfskassen") in connection with each Provincial Government for the assistance of agriculture. Purses for particular improvements have also been founded. Prizes for the best treatises on various agricultural subjects have been offered likewise by the State. For a similar purpose the National Agriculture Edict of 14th September, 1811, makes it a duty of the agricultural commissaries, and some other authorities to avail themselves of opportunities to instruct the possessors of land in the most advantageous mode of using the soil, to make the latest improvements in agricultural arrangements known in the district and to urge their adoption. In this sense the Administrative Authorities of the State and Provinces have issued many an instruction, as witness those with regard to the potato disease and cultivation, to linseed and to beetroots; as also those recommending the cultivation of certain useful plants; as also those recommending practical agricultural implements; as also those pointing out practical modes of using field produce, otherwise wasted, such as frost-bitten potatoes, &c.; as also those recommending the practical modes of preserving field produce; and lastly, as also those recommending certain economical arrangements, such as bakehouses for a commune, &c.

Ministry of Agriculture.

102. Finally, reference must be made to the often incidentally mentioned fact of the existence of a special Ministry for agriculture, although the scope of this inquiry does not take in the administrative organization of Prussia. This Department was separated in 1848-49 from the Ministries of Commerce and of Finance, and has under it the central authorities of the National Agriculture Board and of the central commission for the rent-charge banks. Then there are the provincial authorities, and also a board of appeal for all matters of national agriculture, besides the special procedure authorities previously noticed. It will also be of interest to notice the organization of the Agriculture Board (Landes Œconomie Collegium) in Berlin. This consists of members for life, selected by the Minister of Agriculture from the practical men of each province. They meet together four times a year, and are liable to be summoned at any time to Berlin by the Minister. They constitute, in fact, a deliberative council on agricultural subjects in aid of the Minister. Their actual expenses are paid, but the chief feature of the institution is that the members are unpaid. The members, however, receive the title of Agricultural Counsellors (Landes Œconomie Räthe) and may pass from that rank to the rank of Royal Special Counsellors. The Board issues an annual Report containing valuable information on agricultural matters; but whether or not, the institution is the best fitted for the object in view I am unable to say.

(b.)—The Laws limiting the Powers of Disposal over Landed Property.

103. It has been already noticed that the Edict of 9th October, 1807, contained an amendment of the Law of *fidei commissa*. It will, however, be necessary to inquire further how far property in land is restricted by existing Prussian Laws and Institutions.

Right to dispose of property.

By the principles of public law the exercise of free power of disposal over property may be limited to the life of the occupant. By the civil law the exercise of these powers was prolonged beyond life by recognizing in law the will of the occupant as to disposal of his property after death. According to German views these free powers ceased at death. But the German Law diverged widely from reputed German views, and seems to have gone even beyond the Roman Law in the freedom of disposal which it conferred. The Prussian Law has for its basis the free will of the deceased, whether his will be embodied in a deed or in what is emphatically called a will. From this rule there are few exceptions. The rule is manifested in the freedom of powers of appointment and bequeathal. The exceptions are found in the doctrine of indefeasible heritages. It is obvious also that the rule, as exercised by past occupants, has created for present occupants what are practically exceptions to the rule, for the incidents of *fidei commissa* and the fixed descent of certain kinds of landed property constitute restrictions on the conceded freedom of disposal. If the State had merely conceded the right of nominating an heir who should, or heirs who should severally, exercise subsequently a similar right, such exceptions could not have arisen. A nearer approach of national law to the principles of public law would confirm the use thus restricted of powers of disposal, subject to certain necessary limitations, but would not confirm that use of the freedom of disposal which enslaved the property without power of emancipation in the hands of subsequent occupants. Prussian Law, however, lays down the rule and exception just mentioned. But whatever is a restriction on the freedom of disposal is, if the property be land, a restriction on the power of the owner to sell his property. It will, therefore, be requisite to consider briefly on the one hand the legal incidents of *fidei commissa* and the nature of the fixed descent of certain kinds of landed property, and on the other hand the nature of indefeasible heritages. The former

constitute restrictions created by private individuals with the aid of the law. The latter constitute restrictions created by the State in the law. The first class of restrictions now claims attention.

The system of *fidei commissa* for the benefit of families shall be first examined, leaving for subsequent notice the restriction of hereditary estates ("Stammgüter") and fiefs, and of the laws of certain common rights in property ("Gütergemeinschaft") of the Prussian nobles, as well as the restrictions from customs of the estate having the force of law.

(*a.*)—*Restrictions by the Institution of Fidei Commissa.*

Definition of *fidei commissum.*

104. By the law of such *fidei commissa* is understood the law regulating the creation, under private directions, of entails, settlements and other forms of trust, for the benefit of one member of a family.

Comes from Roman law.

This system is that of the Roman civil law modified by German common law. The civil law recognized powers of appointment in favour of a member or members of a family. It, however, recognized only the form of a legal arrangement between living persons. The duration of a *fidei commissum* was originally determined solely by the will of the founder, and the property became in the hands of the last-appointed heir, free and capable of being by him again placed in a *fidei commissum.* But Justinian limited the duration to a certain number of generations.

Grew in Germany.

105. In Germany this legal institution grew up from the seeds of Roman Law under the influences of antecedent and contemporaneous circumstances peculiar to Germany. Landownership, as in other countries, was the first outward sign of wealth. Early law was, consequently, favourable to transmitting landed property undivided to the sole use of one member of the family of an existing owner. The peculiar intestate succession, which either excluded females or preferred males to females, obtained in Germany, and effected this indirectly. Hence arose rights of expectation on the part of heirs, and ultimately restrictions of the right of the occupant for life to alienate the property. These restrictions were brought about more especially, on the introduction of Roman Law, by the nobles, who foresaw danger to their position from the increasing custom of alienation of land by possessors under the pressure of agricultural circumstances. The German common law was then developed on Roman models in its dealings with land and in other matters. The property rights of the nobles were accordingly defined, and the institution of *fidei commissa* established, not only for them but for all classes.

Incidents of its foundation.

106. The will of the founder is the basis of *fidei commissa.* The German common law prescribes no restrictions as to the persons to be benefited. Such restrictions may occur in consequence of the prohibition in special national bodies of law to certain persons to hold certain property. The objects of a *fidei commissum* are by the common law restricted to available objects of property yielding returns without waste of the original object. Hence immovable capital, such as landed property, forests, mines, houses, can form such objects; hence all movable capital can form such objects. The Prussian General Body of Law recognizes both categories of objects. The same rule obtains in Hanover but not in Hesse, where landed property is a legal object of *fidei commissa.* The property forming the object of a *fidei commissum* must be quite free from all charges and claims. If, therefore, it be landed property, the *fidei commissum* is no bar to the rights of the mortgagee. The legal and obligatory shares in an inheritance which belong to certain relatives must be paid before the object of the *fidei commissum* is set apart. A fief can, under certain conditions, become the object of a *fidei commissum.* According to the common law there is no restriction whatever as to the value of the objects of *fidei commissa,* but special national bodies of law contain restrictions. Thus, the Prussian Body of Law requires for landed property a net income of nearly 400*l.* from the property after payment of all debts, charges, and claims. The Hanoverian Body of Law places the minimum at about 180*l.* a-year. The Hessian Law requires a value of 7,500*l.* in the landed property.

Form of creation

107. A *fidei commissum* can, according to the common law, be created by contract, deed or will. But the Hanoverian law restricts it to creation by deed. The creation is surrounded by several legal formalities. In Prussia it is also subject to judicial incidents, and in Hanover, Hesse and Oldenburg it is subject to the consent of the Crown. Its creation, therefore, is often more difficult than the creation of similar entails and settlements in England.

Powers of tenant for life.

The tenant for life can let on lease and charge the land with annuities to his daughters, and can cede any or all of his rights to third persons, even gratuitously for his life. It is recognized by the Bavarian law as the duty of a tenant for life to provide for his brothers and sisters and widow of the predecessor if they be destitute of fortune, as also to give dowries to his daughters and sisters; and by the Hessian law as his duty to give to sons an allowance on founding a home of their own equal to the sustenance then afforded.

The amounts are not fixed; they are dependent upon circumstances. But the Prussian Body of Law is silent upon this point. The other powers and obligations of the tenant for life are the same as in England. Landed property in *fidei commissa* can, of course, be expropriated. Many earlier jurists laboured in favour of establishing such classes of reasons for destroying the inalienability of property in *fidei commissa* that they would have entirely defeated the aim of the institution. But the times were not ready for such doctrines, and landed property in *fidei commissa* could therefore be alienated only on grounds of usefulness and necessity. By necessity are meant expropriation, and the like, and by usefulness is meant the sale of useless property: *i.e.*, property, producing no net increase or even causing outgoings beyond the returns, which may form part of the *fidei commissum*. A wrongful alienation will become valid against all parties as soon as the right of restitution has become barred by lapse of time. Property can be removed from a *fidei commissum* by consent. The Prussian Body of Law insists upon the decision of a family council of all interested parties. This condition with the previous formalities is upheld in the law on *fidei commissa* and fiefs of 15th February, 1840, but has been accompanied with the following exceptions, viz.: that the family decision is not necessary when dealings with the property take place in connection with legal obligations and when exchanges of parcels of land are effected in the same neighbourhood, or parcels of land are sold in order to purchase others in like manner. In these cases the consent of the two next heirs in remainder only may be required. The Baden Body of Law allows an alienation on obtaining the permission of the Crown alone, and allows without such permission the alienation of parcels of land, provided the original legal minimum value of the property in *fidei commissa* be maintained. The Hessian Law follows the Prussian, but substitutes the competent Tribunal for the two next heirs in remainder as regards exchanges of land.

Limits of inalienability.

108. The property in *fidei commissa* pays the debts of the founder, also the expenditure of the possessor for the abolition of real charges, for embankment dues, for flood rates, for rebuilding, and for bringing worn-out land again into cultivation. The Prussian Body of Law accords with the common law; but makes the income, and not the capital, liable for the repayment of certain kinds of expenditure, and makes the contraction of some kinds of debts dependent upon the decision of the tenant for life, the heirs in remainder and the *fidei commissum* Judge sitting as a Court of Equity. The Hanoverian Law requires the consent of the competent Department of the Government to the contraction of debts, and requires further that they should be paid off from the income within a period fixed by that Department. The Hessian Law mainly follows the Prusssian; but limits in most cases the aggregate of debt incurred to the excess in the value of the settled property beyond the legal minimum value, and insists upon a sinking fund for repayment out of income. The successor to the estate seems to be bound to pay to the heirs of the tenant for life the moneys laid out in improvements of the property.

Charges on property in *fidei commissa*.

109. The order of succession under a *fidei commissum* is prescribed by the founder. But the selection of a succession to the oldest member of the family is for the future prohibited. The common law recognizes not only children born in wedlock but legitimized children as capable of succeeding. But the special national Bodies of Law differ in this respect. The Prussian Body of Law does not admit legitimized children to succession. Monks are excluded from succession, and it would be contrary to the intentions of the institution to allow dishonoured persons, *i.e.*, persons not in the full enjoyment of their rights as citizens, to succeed. The succession is usually limited to male descendants. The Prussian Body of Law excludes the female descendnats even after extinction of the male descendants, unless the founder of the *fidei commissum* shall have otherwise directed. The Hanoverian Law, recognizing primogeniture and the preference of male descendants, follows the Prussian. So does the Hessian Law. But the Brunswick Laws admit the female descendants on the extinction of the male. Whenever the founder has not determined the order of succession, then the settled property follows the laws of succession. Thus according to Prussian Law it would pass to eldest sons; and when the last occupant has no son would then only pass to the eldest daughter and her male descendants, then to the second daughter and her male descendants, and so on, till, in default of such descendants of any daughter, it would pass to a male descendant of the cognates of the founder, who would take the place of the founder.

The order of succession.

110. The duration of the *fidei commissa* depends also entirely upon the will of the founder. The German jurists have most fully discussed the limited or unlimited period of a *fidei commissum*, learnedly as to the bearings of the civil law, and contradictorily as to the bearings of the common law. Special national Bodies of Law have, however, usually recognized its perpetual character. A *fidei commissum* can, according to the common law, be extinguished by the general consent of the family. The Prussian Body of Law contains no such an enactment, but the practice of the Law Courts, having been in

Its duration.

accordance with that principle, the Edict of October 9, 1807, placed it beyond doubt, and the Law of February 15, 1840, confirmed it. The Baden, Brunswick, and Hessian Laws established it, the first requiring the additional consent of the Crown. Legislation can also extinguish *fidei commissa*, as well as prohibit their creation in the future, for it merely uses the principle of expropriation. Thus in the Rhine Provinces, and in many parts of North Germany they were abolished on the introduction of French Law, without any compensation to the heirs in remainder, or with the single reservation of the succession to the next heir. They were, however, re-established in nearly all such districts. The 38th paragraph of the Land Rights of the German People runs: "The *fidei commissa* are to be abolished. The form and conditions of such abolition are to be determined by the legislation of each State." Accordingly, but not consequently, Brunswick in 1850, and Oldenburg in 1852, promulgated such a Law. The Law in Brunswick was withdrawn in 1858; but the Law in Oldenburg appears to be still in force, so that in a generation land will there be almost completely freed from the restrictive effects of *fidei commissa*. In the former law the possessor received limited free powers of disposal, the next heir received at the death of the possessor one-third of the value of the property, and the relatives who were entitled in law to obligatory shares in the inheritance received another third of that value. In the latter law the possessor receives free powers of disposal only on the death of the heir next in succession at the time of the passing of the law and of his child, or on the extinction of their rights by, for instance, the birth of a nearer heir. In the meantime the legal rights of the heirs in remainder are maintained. A similar abolition of *fidei commissa* found a place in the Prussian "Constitution," but was cancelled in 1858.

bolition by ench law.

ormer law of runswick on olition.

bolition in ldenburgh.

111. The creation of *fidei commissa* was intended to preserve the wealth and position of certain families. It is doubted in Germany whether on the whole the institution has succeeded in even fulfilling its intention, and it is held that the State cannot have a special interest in the wealth of a few families, but must regard the welfare of the whole nation. Their perpetual nature, too, is used as a weapon against the institution, for if it be unfair to make a law of the present retroactive into even the immediate past, is it not unjust that private individuals in the past, more or less distant, should make laws of the Medes and Persians that change not throughout the future, and should thus fetter by their *fidei commissa* the free development of a nation's resources?

erman opinions.

112. This outline makes evident the restrictions to which property in land is subjected by reason of entails, settlements, and other trusts arising from the private directions of individuals, and shows how similar the institution of family *fidei commissa* is to the English institution of entails and settlements, and also in what respects the legal incidents of such entails and settlements differ from those in England.

In order to complete this part of the subject it is necessary to notice the other restrictions of a similar nature arising from hereditary estates ("Stammgüter"), from fiefs, from common rights in property ("Gütergemeinschaft"), and from customs of the estate.

(β.)—*Restrictions by other Institutions.*

Iereditary estates.

113. The hereditary estates in Germany are no doubt the remnants of a system from which the English law of intestate succession for land has descended, and from which the tradition of heir-land amongst the peasantry in many parts of England has arisen. They are, in fact, estates which strictly descend by a customary entail from father to son, either subsequently recognized or still unrecognized by local law. Such a custom of succession can be traced back to the 6th or 7th century, and is said to be recorded by Tacitus. This custom existed before laws, and doubtless formed the basis of many a law on land. The feudal law of descent is connected with it, and the German *fidei commissa* are a later growth from it. The political signification and the political history of such a custom and such estates need not be referred to here. The succession to these estates is that of a strict entail, for only descendants of the original acquirer or, to use a law term, the original purchaser can inherit them. The estates, therefore, differ from the allodial lands of modern signification, although the term allodial land seems originally to have been synonymous with hereditary land. If an hereditary estate arrive into the hands of a descendant of the original purchaser without there being any other descendant of his to inherit them, that last descendant can dispose as he will of the property. But otherwise the inalienability of the property is strict, and is an essential incident of hereditary estates. In what are called allodial hereditary estates the succession is the succession of the civil law, unless tradition or custom has sanctioned the succession of the eldest son. But it is only of strict hereditary estates that mention is here made. Even in the hereditary estates of peasants, with more or less of dependence upon the lord of the manor, the rule as to nalienability, and consequent indivisibility, is retained. It seems, however, that the

inalienability can be destroyed, or, in other words, the customary entail can be disregarded on the agreement of the occupant with the next heir, without any other heir in succession having the right to object. If, also, the occupant find himself in dire need he can alienate the estate on first offering the purchase of it to the next heir. If in any other manner the hereditary land were sold, then the next or other heirs could follow it into the hands of the buyer and repossess themselves of it without giving compensation. As regards such lands belonging to townsmen they gradually lost their hereditary character, and where the original character still subsisted, the right of repossession of the next or other heirs in case of unauthorized sale was changed into a right of pre-emption. But they seem to have maintained their character in many parts of Germany as regards lands belonging to the peasants. In Prussia this character has been almost entirely removed from peasant properties, and except for the custom to which many peasants adhere of willing the land to one, usually the eldest, son after making legal provisions for the other children, the trace of it amongst peasants would be almost lost. But there are still such entails held by the higher classes founded either on custom, or on a family bye-law, or on a provincial law. In conclusion, it may be noticed that a Decree of 1836 reestablished the privileged landowners in the Rhine Provinces, so that the Rhenish nobles became entitled to bequeath their estates to one son, after making a certain provision for other children; but it has not yet appeared that this law has had much practical effect.

The other legal incidents of hereditary estates are, *mutatis mutandis*, those of estates in *fidei commissa*.

Marriage property rights.

114. In the next place there are the restrictions on the right to dispose of land caused by the so-called property right ("Güterrecht"), or the so-called system of property in common ("Güteremgeinschaft"), which comes into operation on the occurrence of marriage in various forms and shapes according to the province. So far as the system affects land it is entitled to insertion. It includes the right of the husband to a share in the wife's lands, and the right of the wife to a share in the husband's lands, and is correspondent, therefore, as to the rights to the right of dower and of curtesy respectively in the English law; but is by no means correspondent as to the shares to those rights of the English law. This system of land in common does not exist according to the Prussian body of law, except by special law, and is usually based on a provincial law, or a family bye-law, in both cases arising from long established custom having acquired the force of law. Whether this system has its origin in the German principle of common property, or in the "condominium" of the civil law, is not relevant to the present inquiry. But it is relevant to record that the Prussian body of law gives the position of joint tenants during life to husband and wife, although it does not always carry out logically the principle of joint tenancy. Provided the family bye-laws do not recognize a joint tenancy after death of one of the parties in favour of the survivor on the one side, and the heirs together of the deceased on the other side, and provided such family laws do not recognize the right of the survivor to the whole as inherent in the joint tenancy, the Prussian body of law seems to lay down that the right of such a joint tenant ceases on the death of the other party, and that the survivor and heirs of the deceased become tenants in common until their respective severalties can be ascertained. The various reasons for compelling the ascertainment of their severalties by the children need not be enumerated. On the cessation of the tenancy by the decease of one party, the other becomes entitled to a half of the landed property, the remaining half forming the estate of the deceased. This does not exclude the survivor from being a co-heir to this other half. And if there be no relatives of the deceased within the sixth degree, then the survivor is sole heir to that half. According to some family bye-laws the joint property is liable for debts of the deceased, but the Prussian body of law, establishing a personal remedy for such debts, does not diminish the survivor's half share by payment of half of the deceased person's debts. The restrictions imposed by the occurrence on marriage of this property right upon dealings with land are evident.

Feudal estates.

115. In the third place, there are the restrictions on the right to dispose of land caused by the feudal law of descent. It will not be expected that this investigation should extend itself to an inquiry into the legal incidents of fiefs; especially as the learning on the subject is so intricate that very few jurists during the last fifty years in Prussia have been conspicuous for an acquaintance with them. Their legal incidents so far as they create restrictions in land are in the main similar to those of estates in *fidei commissa*. But the following outline of general feudal law in Germany will show how far land is affected restrictively by it. Feudal land descends from the first holder in the direct male line, excluding therefore ascendants and cognates. The order of succession may be special or legal. The legal order is by degrees; the special order may be by promogeniture, by the succession of the eldest of the same degree, or by the succession of the eldest member of

the family. The vassal can lease, and can improve his lands. In the latter case the allodial heirs can claim compensation from the feudal heirs. The vassal can exercise sub-infeudation. He can also alter the succession if he do not call in as heirs other than descendants of the first holder. He can restore the lands to the feudal lord, who will then have both the dominant and usufructuary property, He cannot alienate or mortgage the lands without consent of the lord, except in certain special cases provided specially by law, and without consent of the cognates. But such feudal lands can be sold by order of the Court to satisfy debts of the vassal incurred for the benefit of the fief. It will be observed that the usual inalienability and the usual descent of feudal lands constitute restrictions on the right to disposal of land. It must, however, be recorded that in Prussia as early as in 1717, the conversion of Crown fiefs into hereditary lands was commenced. There remained after the Peace of Vienna only a few Crown fiefs, and the private fiefs, and a few others. The Constitution declared, "the establishment of fiefs is prohibited," and existing fiefs are to be abolished. The Law of 1850 abolished the dominion and all the resulting rights of the feudal lord, except in the case of Crown fiefs, about a dozen in number. Even these have lost much of their feudal character. As regards private fiefs, the legal relations of the co-feoffees and of cognates constitute the chief distinctions between feudal estates and estates in *fidei commissa*.

Customs of the estate.

116. In the last place there are the restrictions caused by customs of the estate having the force of law. It has been recently ascertained that these customs are very numerous in the province of Saxony and elsewhere. So far as the existing legislation has not inferentially or expressly abolished them, they certainly have the force of law, and lands descend as freeholds, or rather as absolute properties, subject to the customs. The customs are not, however, either in Saxony or elsewhere of sufficient importance to need detailed reference in this investigation. It may, however, be recorded that one of them resembles very nearly the custom of Gavelkind. The custom of Borough English has also existed, and continues to exist. The restrictions imposed by these customs have a not inconsiderable influence upon the general freedom of disposal over land.

Mortmain.

117. The fact that land can in Prussia, as elsewhere, be placed in mortmain must not be overlooked. The churches and parsonages, the universities and public schools, the nation's schools, and the religious and charitable institutions, have their endowments in land which is withdrawn from the free exchange.

In a similarly restricted position are very frequently the lands belonging to corporations of towns and communes. Formerly, according to the Prussian Body of Law, the acquisition, alienation or mortgaging of land was forbidden to such corporations. But now corporations of towns can acquire land, and can, on receiving special permission, sell them at public auction. Corporations of communes can only acquire and sell land under certain conditions of previous sanction.

The Crown lands must also be mentioned as withdrawn from the free exchange. They also constitute an institution which limits the powers of disposal over land.

Failure of Law of 1836 on Peasant Succession.

118. This account would not be complete without noticing the attempt made in Westphalia by the Law of 1836 on peasant succession to maintain the position of the peasantry by a kind of obligatory succession of one heir similar to that of a *fidei commissum*, with portions for the other co-heirs of the deceased peasant. The attempt was, as might have been expected, a failure, and in 1848 the law was repealed. Since that time there has been in respect of peasant properties no exception to the abolition in 1807 and 1813 of all obligations to a certain kind of succession by reason of provincial or local custom.

119. It will be seen from the foregoing account that, in addition to the stringent limitations of the right to dispose of land imposed by the institution of *fidei commissa*, there are certain more or less stringent limitations imposed by several institutions under the express or tacit sanction of the law.

(γ.)—*The Influence of Indefeasible Heritages.*

120. The class of restrictions created by the State, through its law of indefeasible heritages,* next claims attention. The history of the doctrine, with all its complications and contradictions, need not here be touched, for the editors, of the Prussian Body of Law have generally forsaken the tortuous path in this instance of civil law, and walked in the easier path of their own construction. The common law requires that parents should leave their children a fixed quota of their property, and that children who die without descendants should likewise leave their parents a fixed quota of their property. The only exceptions to the rule are those in the law which provide for the reduction or withdrawal

Incidents of the law.

* *Vide* **Appendix of Definition of Terms.**

of that quota in certain cases. Apart from such exceptions, the beneficiaries must receive their shares in full. The mere fact of a will not recognizing such natural heirs does not now invalidate it, neither does it matter, if the will recognize them, out of what property or in what manner their shares are bequeathed. But if the will do not recognize them, then the testator's estate is considered to be intestate to the amount of the obligatory shares; or, in other words, the natural heirs are regarded as heirs *ab intestato* to that amount. It must also be noted that widowers and widows are invested with such obligatory heritages, but that brothers and sisters of the deceased are excluded. As to descendants, legitimized and adopted children are admitted. The shares of the children varied at different periods of civil law. Justinian introduced the principle of increasing the aggregate of obligatory heritages according to the number of children. He established two proportions for that aggregate: one-third, and one-half. The Prussian law adopts the principle, and increases the proportions to three. It fixes one-third for one or two children, one-half for three or four children, and two-thirds for more than four children. But these ratios are not calculated on the whole inheritance, they are calculated on the portions which each child would *ab intestato* have inherited. In each case the aggregate is equally divided. There are some disputed points in the application of the law, which need not be mentioned in this review of the subject. As to ascendants, the parents must be real and not adopted parents. Each ascendant in the direct line has an obligatory share. The ratio of the aggregate is, without regard to number, one-half of what would be inherited *ab intestato*. No share can be reduced, and each share must be quite free. As to widows and widowers, the survivor is entitled to the half of the legal intestate share. The state of law for each of these two classes—the ascendants, and the widows and widowers—is in a very unsatisfactory condition. The descendants are preferred to the ascendants, but the widow or widower has an obligatory heritage conjointly with descendants or ascendants. If previous gifts to natural heirs be set out in order to reduce their shares, such gifts must be bought into hotchpot.

Exceptions.

121. The foregoing incidents constitute the rule in the law of natural heirs; but there are exceptions, which provide for the reduction or withdrawal of obligatory shares. The testator is empowered, not bound, to use such exceptions; but if he do, the reasons of each reduction or withdrawal must be clearly stated in the will. As regards descendants, the Prussian Body of Law recognizes for withdrawal nine exceptions, which consist of various crimes, want of natural affection and a debased life; and, for reduction of shares to one-half exceptions arising out of unauthorized marriages. As regards ascendants, there are for withdrawal (no grounds for reduction exist) seven grounds, comprising various crimes and want of natural affection. As regards widows and widowers, the modern law is new law, and the grounds for withdrawal or reduction of shares are those for a divorce or separation. All these causes for withdrawal or reduction, in each class of cases, must be still working or recognizable in their effects at the time of the will coming into force.

A notable device.

122. A notable point in this system of law is the device by which a testator may persuade a natural heir to abandon his right to a share unburdened by limitation of any kind. He must resort to the so-called "Cautela Socinii," which consists in leaving to a natural heir a larger fortune with limitations at the will of the testator than the obligatory share, on the condition that he abandon that share. The Prussian Body of Law differs from the common law, for it declares the child to be bound by the direction of a parent, bequeathing to him his whole inheritable share of the fortune, to retain it for the grandson, *i.e.*, to place it in a *fidei commissum* for that purpose. This is a curious anomaly, no doubt arising from the influence of primogeniture upon even this law on behalf of children's rights.

Modified disinheritance.

123. The doctrine of the civil law of "*exheredatio bonâ mente*" is modified by the Prussian body of law into an allowable settlement of the obligatory share (with remainder to the children, or the brothers and sisters and their children) of a natural heir, if his share would be entirely or mainly swallowed up by his debts, if his life be that of a spendthrift, or, if he be a lunatic or idiot. It need not be added that these provisions of the law apply to deeds or contracts for the distribution of property as well as to wills.

Marriage compacts.

124. In concluding this brief review of Prussian law on this subject, it may be recorded that marriage compacts with similar incidents to those of such contracts in England are recognized by Prussian law, but are subject to revocation by mutual consent, and by birth of children as well as by the usual reasons of revocation.

Influence of indefeasible heritages.

125. It is obvious that the restrictions, imposed on the right of disposal of property by the law of indefeasible heritages, tend to break down the restrictions imposed on free trade in land by *fidei commissa*, and the like. They prevent the founding of *fidei commissa* and the bequeathal to one individual of estates, until the obligatory heritages are set

apart. They prevent also the adherence to customs of descent in cases where the property is not sufficient to satisfy the obligatory heritages; thus this institution causes alienation and division of land in cases, where without such a doctrine of law estates might pass undivided from the favoured individual of one generation to the favoured individual of each succeeding generation. But it must be recorded that the law of indefeasible inheritances belongs to the domain of private law. Its benefit must be claimed by the private persons interested.

(c.)—*The Laws of Intestate Succession.*

Right of succession *ab intestato.*

126. Whenever an occupant of property does not avail himself of the recognition by law of his freedom of disposal, then that freedom of disposal reverts to the State. By public law the State might exclude all relatives from possession of the property, and dispose of it in any other manner for the welfare of the nation. The state might also disregard the principles in its laws concerning an occupant's freedom of disposal. But the State usually follows in cases of intestacy and of the absence of any directions by the deceased occupant, the custom of the nation, as established by appointors and testators. The State has hitherto rarely laid down rules of intestate succession, differing from the rules adopted for appointed and devised property. The Prussian law of succession to intestate property is no exception to this remark.

Who admitted.

127. The rule of the Prussian law of intestate succession is that of the civil law, with alterations engrafted into it from German common law. That rule is the admission of certain persons in common to the inheritance. The rights to intestate inheritance may be cancelled for the same reasons originating in the civil law as those for cancelling rights to other inheritances. The perfect rights of inheritance reside in relationship by blood from a valid and perfect marriage. The imperfect rights of inheritance reside in the children of certain invalid marriages who are considered as legitimate, in the children of a morganatic marriage, who are considered as legitimate children of the mother, and sometimes as half brothers and sisters to the father's children of another marriage; and in legitimized children who are considered as legitimate children. The artificial right of inheritance is that of children adopted by either *modus*.

Order of succession.

128. The three orders of succession, lineal, next of kin and collateral, are recognized by the common law. But the Prussian Body of Law seems to follow no fixed principles. Its order of succession by relationship need not, however, be recorded here; nor need the rights of widower or widow be recorded as set forth either in special, provincial or national laws. It may, however, be noticed that the widow or widower inherits together with the other heirs. The former takes one-fourth part, if there are only two children with families, and takes a share equal to that of each child if there are more than three children with families. In the latter case, strictly equal division is the result, as it is whenever the children alone inherit. The share of the widow or widower increases as the relationship of the other heirs decreases. It should also be noticed that recognized illegitimate children are admitted to a sixth part of the inheritance in default of children of a morganatic marriage, who take after the parents of the deceased and after the widow or widower.

Shares of heirs.

The succession to fiefs and to property in *fidei commissa* is treated as intestate. As that kind of succession does not rest upon the total absence of private directions by the founder or owner, it is not mentioned here, but has been referred in the previous subdivision of the Report. There are also some other forms of succession which are not, however, of sufficient importance to find a place here.

No distinction between real and personal estate.

129. From the foregoing outline it will be seen that in Prussia canons of descent for land find no place in the laws of intestate succession. On the contrary, the principle of division is as fully applied to land as to other kinds of property.

(d.)—*The Law of Landlord and Tenant.*

130. The Prussian Law of contract is developed from German common law under the influence of the civil law and is not much less complicated than most other branches of Prussian Law. It is rendered still more difficult by the retention of real and personal rights. But, so far as it relates to demises, an attempt will be made to give an outline, however meagre, of it. The law differs, chiefly in its presumptions, according to the object demised, whether it be a house or it be land; only the law with respect to demising land is relevant to the present inquiry.

Distinction as to letting houses or lands.

131. There are two kinds of demise, that which grants the use and that which grants the usufruct. The latter can only occur in respect of a productive thing, such as land, but the former can occur in respect both of a productive thing, such as land, and of an unproductive thing, such as a house. If, therefore, a contract do not contain internal evidence of the kind of demise intended, the presumption in a demise of land is held to be that it is

of the latter kind. To this kind only need the present inquiry be directed, for it can seldom occur in agricultural demises that the use only and not the usufruct is granted.

132. A parol agreement is only an agreement for one year at the longest. The obligation as to the kind of written contract varies according to the amount of rent. A demise of land for more than a year, if the rent be even under 7*l.* 10*s.* per annum, must be in writing, but if the rent be 30*l.* or more per annum, and if a whole estate, and not merely isolated fields or a portion be demised, it must be executed before a competent tribunal or a public notary. But execution before the legal adviser is sufficient in cases in which credit associations and the like are parties.

Parol agreement

When contract must be written.

133. The lessor can demand that a contract of demise be registered in the Mortgage Register. As regards interpretation the presumption is against the lessor and in favour of the lessee. The rent may be in money or kind, and the rent in kind may be either fixed or proportionate. But if the rent in kind be the latter the shares of lessor and lessee are determined by the law of the contract of association. The lessor, apart from express covenants to the contrary, is responsible for all charges upon the demised land, and the lessee similarly has to pay the taxes. No lessee can sublet without special permission of the lessor, but if the demise comprise several distinct kinds of agricultural industry or several outlying fields the lessee can, without express permission, sublet such a distinct kind of industry or such outlying fields. As regards improvements, compensation can only be claimed for those which have been expressly sanctioned by the lessor, and the lessee can in no case compel the acquiescence of the lessor. But the lessee is entitled to compensation from the lessor for improvements ordered by the Executive of the Crown. Also if the rights of the lessor become extinguished and involve the determination of the lease, the lessee is entitled to full compensation for improvements and for the unlapsed portion of his lease. The compensation is found by distributing the costs of the improvements equally over the whole term of the lease, and by charging the quota of each unlapsed year. The costs of protecting a demised property from damage can be claimed from the lessor by the lessee. The rent is, apart from express covenant to the contrary, quarterly, and arrears of two quarters give the lessor the right to give notice to determine the lease. On the other hand, if the lessee is by circumstances beyond his control, and not merely by personal disability, prevented for three months or more from benefiting by his usufructuary right, he can claim a proportionate reduction of his rent. If he be thus prevented for a year or more from exercising his usufructuary right, no rent can be demanded for that time. For arrears of rent or other demands the lessor has the right of distress* upon the goods and chattels of the lessee found after determination of the lease upon the demised land. These rights extend to things of which the lessee had after alienation only retained the use during the period of the lease, to standing crops as well as crops gathered in, and to the live and dead stock. But these things must have belonged to the lessee. The right of distress attaches to all goods and chattels from the day of their arrival upon the demised property. On the other hand, the lessee can withhold rent to satisfy claims for compensation. Contracts of demise can be tacitly prolonged year by year, but in farms divided for rotation of crops such a tacit prolongation can only be determined at the end of a period of such rotation according to the local custom. In no case, however, can notice be given except six months before the end of the agricultural year.

As to form of rent.

Sub-letting.

Improvements.

Rights of tenants to compensation.

Right of distress.

Tacit prolongation.

134. A lessee is obliged to suffer determination of his lease at any time whenever a forced sale by law of the property takes place. But he can claim compensation from the estate of the lessor with the status of a preference creditor of the third class. The heirs of a lessor are only obliged to recognize leases for one full year or for the customary agricultural period. For abuse and misuse of his usufructuary right the lessee is subject to determination of his lease at any time. If the lessor be only a tenant for life or for a term of years, then his successors are not bound to recognize the leases beyond one year, as above. In such a case the lessee, if the fact of the smaller estate of the lessor had been concealed from him, can claim compensation. For breach of covenant a contract of demise can also be annulled.

Determination of lease.

135. The lessee must maintain the demised lands in good condition and the demised buildings in good repair. But repairs, which are not rendered necessary by the carelessness or want of foresight of himself or his agents or which require materials not to be found on the property, are to be made by the lessor. The lessee can agree with the labourers with regard to certain kinds of contract labour ("Scharwerkdienste")† to receive a fixed sum in lieu of the services, but he cannot increase or diminish their rights or lay upon them greater charges than they previously had. The lessee cannot sell straw and other materials used

Obligation to to repair.

Provisions for leases of farm and stock, &c.

* For a fuller account of the Prussian law of distress, consult Baron Thile's Note on the subject, dated April 28, 1869, and forwarded to Hypothec Committee of House of Lords.—*Vide* Parliamentary Papers, No. , pp.

† *Vide* Appendix of Definitions and Terms.

in manure, and cannot diminish the cattle received with the land. But the lessor must replace the cattle killed by plague or other unusual misfortunes. With regard to sheep the lessee bears the loss of the first and third quarters of the flock, the lessor bearing the loss of the second and fourth quarters. If the cost of replacing cattle be unavoidably more than the estimated price in the lease, the lessor is bound to pay the difference. As soon as the lessee fail to observe his agricultural covenants or obligations and as an expert shall pronounce that a deterioration of the soil has been caused, the contract of demise can by the help of a tribunal be set aside. A partial remission of rent for failure of a crop from external causes, such as frost, draught, hailstones, destruction by mice, locusts, flooding, and the like, can be claimed. If the demise had been accompanied by a valuation, the fundamental prices of that valuation must be used. A partial remission can likewise be claimed in cases of damages by fire and by water.

Breaches of covenant.

Remissions of rent.

136. Church lands can be demised, but only by acceptance of one of public offers. Glebe land can be demised as other land and with similar legal incidents.

Crown leases.

137. With regard to demised Crown lands, the Crown has a special preference right on the property of lessees. The lessees except by special covenant can claim no remission of rent for damages by fire. The widow of a lessee is obliged to appoint a *bailif* to cultivate the lands until the lease determine. The Crown leases are very strict repairing leases with minute directions as to annual renewal of perishable materials. The penalty of any breach of covenant is distraining by the executive of the Crown.

Eviction.

138. Eviction even in questions of deterioration requires judicial sanction. A claim for an eviction for deterioration of the soil has from the date of the notice in court a suspending effect; but other evictions for other reasons must be first decided in court, and then can be carried out with reservation of the rights of both parties, before an appeal is decided. The evicted lessee has the right to claim reinstation on various grounds.

The stamp for contracts of demise is $\frac{1}{3}$ per cent. of the value.

Valuation.

139. The valuation which often accompanies a contract of demise is exceedingly detailed, entering into qualities and productiveness of the soil. Such a valuation must be carefully drawn up, as a variation in the results from its estimate gives a claim for compensation or even annulment of the contract. It is always part of a demise of a farm with a land and all live and dead stock and implements,—a formerly not unusual form of agricultural lease.

It is usual to give security of from one to two years rent. The term of the lease is usually twelve, eighteeen, or twenty-four years.

General remarks.

140. It may be permitted to remark that the law favours stipulations for rent in kind, or at any rate partly in money and partly in kind, for it is considered more fair that the result should in part at any rate vary with the price of corn; that the tendency of the law is to protect the agricultural tenant during the period of his course of agriculture; that the law, however, gives the lessee no right to compensation for the unsanctioned improvements; and finally, that the process of eviction is rendered difficult of execution. Lastly, it may be noticed that although the law does not expressly forbid the letting of land on the condition that the tenant erect and repair buildings, yet, as it was rather the custom to let land not only with buildings but also with live and dead stock, the law recognizes the mutual obligations of lessor and lessee in respect both of repairing the buildings and of maintaining in number and condition the live and dead stock; but the law is entirely silent as to erection of buildings.

(*e.*)—*The Laws of Real Credit.*

141. Under this heading it is intended to draw the outlines of the system of law and the legislation which bear directly upon real credit or, in other words, the personal credit of the owner of real property. That credit takes the outward form of one of several varieties of mortgage, and is accompanied by such subsequent incidents as foreclosure and compulsory sale by auction, and by such antecedent incidents as the title to the property. That credit may call into existence for its facilitation a variety of credit institutions. The question of real credit has, therefore, two sides—the legislative side and the commercial side. It will be briefly examined from the latter side in the third part of this Report. But it is now purposed to examine it only from the legislative side. In general, the student of the foundations and principles of real credit has in most countries a difficult task. It is, however, sometimes lightened by the facilities of comprehensive treatises and of wide-reaching statistics, but it is in most cases burdened by the difficulty of collecting the necessary information and the impossibility of procuring any statistics. In Prussia, fortunately, there exist treatises which lighten one's task, but, unfortunately, there exist no sufficient corresponding statistics.

(*a.*)—*The Laws facilitating the Transfer of Land.*

142. These are laws which render possible the transfer of land, as well as those which facilitate the act of transfer. To the former belong the dismemberment legislation, and the laws granting absolute ownership to peasant proprietors, and also the legislation on rights of common, which have all been already treated at length. To the former belongs also the law of mortgage, which, with its accompanying system of compulsory sale, is sufficiently important to be treated of in the following sections. In the law of mortgage, as laid down in the new projects of law, the act of transfer will be much simplified, for in them the title to landed property is rendered very simple and practically indefeasible, and its proof is rendered as simple as possible. The cost of transfer and mortgage is diminished. Thus, with an improved title, with despatch in place of delay, with facilities in place of difficulty, and with a diminished cost, the facilities of transfer will be yet greater. By the present system the transfer of land is not so easy, and hence probably a portion of the disadvantage at which real credit is placed. The uncertainty of title also in many cases must tend to render more difficult the transfer of land, and thus cause the necessity of paying a higher interest to enable the lender to insure himself against the chances of a defective title.

(*β.*)—*The System of Mortgage.*

143. The law of real property in Prussia appears to be as difficult to understand as is the law of real property in England. But it is evidently a mixture of the civil law and the German common law. It is frequently in opposition to the civil law. For instance, the civil law required no public act in the transfer of property in land. Such a property was the subject of a simple contract when it became necessary to mortgage or otherwise deal with it. A mortgage, too, was merely accessory to the personal right of the mortgagee. The German common law had to recognize very different principles. In Germany (as also I believe in England) property in land could only be granted by actual delivery of the land. At a later period public registration was substituted. The same form ruled in respect of real rights and especially of mortgages, which were not considered as accessory to a personal right, but as constituting an independent real right. The difference between the Romans and the Germans in older days may account for this difference of law. In Rome land had no privileged position in the national property of a military race. In Germany, however, land held an important position in the national property of an agricultural race. It became of preponderating interest to families, and of the highest importance in respect of public rights. Not only the State but the local communities watched the changes in the possession of land with a jealous eye. Hence the German common law recognized publicity as an essential element in dealings with land. Then symbolical delivery succeeded to actual delivery, and the publicity before the State authorities succeeded to the publicity before the local authorities. That publicity then took the form of registration in public registers. Accordingly, the essential incident in transfer of property in land was not in its form as a contract of purchase, of exchange or of mortgage, but in its solemn record before the judge, whereby the interested parties declared in the most positive manner the transfer of property, and the judge recognized with public authority the new acquirer of the transferred property. Thus far the action of the common law. The civil law on its introduction into Germany influenced the development of the law of real property, and forced into the Prussian national system of law many a principle which conflicted with those of the common law. But the principle of publicity had taken too strong a hold of the national system to be uprooted. The civil law succeeded, however, in making the registration in the public registers merely a confirmatory act. Before the promulgation of the Prussian body of law the civil law, with exceptions from the common law, regulated the legal incidents of property in land. But the influence of the civil law became so great in regulating the legal incidents of property of all kinds in such a manner as to establish great freedom of exchange—such a freedom as was useful to the commercial towns—that apprehensions for the fate of landed property arose, and accordingly special legislation was directed towards counteracting that influence. Then, too, there was the feeling that the defective provisions of the civil law in regard of mortgaging lands might find baneful application. Added to these influences was the direct influence of the lectures in the Universities on German common law, which had been inaugurated as an indirect consequence of the attention directed to the principles of Colbert's wonderful administration of France. Then followed for many years isolated attempts of special legislation to establish a mortgage system, and to these finally succeeded the Prussian mortgage law of 1783. This law and the Prussian body of law, promulgated ten years later, adopt the current doctrine of acquirement of title to property without,

Development of law of mortgage.

Law of 1783.

however, the public record, which it changed into merely an obligation to register. The mortgage law is for the last century a pattern of legislation on real property, and Prussia has had the benefit of a better mortgage system for the last eighty years than many other countries. But the law on mortgage has been much complicated. As will have been seen, there was no leading uniform principle in the legislation of 1783 to 1793. The registered proprietor might not be the real owner of the land. The former would have the real rights which limit dealings with the property, but the latter would have no remedy against the former, for he was not the owner. Then the real but unregistered proprietor had no full rights of property. This result may not have occurred in the older days when property changed hands less frequently, but in modern days when the change of ownership is so rapid, the possibility of such an unnecessary collision in the proceedings is intolerable. In fact, the want of a uniform principle in the original law itself resulted in a confusion between registered property and property by contract; and the subsequent interpretations and alterations—especially the abolition of the compulsion to prove the title on registration—made a confusion worse confounded. And to add to the complicated and contradictory doctrine and the bad law of the title to property there came in the distinction between *mala fides* and *bona fides*. If it be borne in mind that these contradictions and this confusion affected not only the title to property but all real rights, some conception can be formed of the unsatisfactoriness of the law on mortgage which had followed, and partly resulted from, the pattern law of 1783. In 1853 the mortgage system was simplified, but the principles of 1783 were retained. There consequently remained for the bewilderment of laymen the set of maxims which lawyers had evolved out of these contradictory principles, and passed on as riddles to subsequent students. Only one way out of the great uncertainty, which often surrounded a title to landed property, was open to the acquirer of the property. He could publicly invite all or any claimants to contest his rights, and thus obtain the power of barring all claims for the future. But the remedy was costly, provocative of delay, and then not efficient; for the announcement of claims to his property could not fail often to render the acquirer's position yet more critical. It was a choice between the possibility of striking on Scylla or the probability of being sucked down into Charybdis.

Complication of law.

Attempted reform.

144. The confusion and contradictions of the law being noticed, it is, however, just to record that much praise is bestowed upon other parts of the existing mortgage system. A reform of it has nevertheless been so loudly called for that a notable attempt at reform was made in 1864. This failed, for it contained contradictory principles and satisfied no party. A more recent project of reform has, however, passed with a better result through the fire of controversy, and consequently bills for the reform of the mortgage system and for the establishment of land registers are now before the Chambers with every probability of becoming law without essential alteration. By them the title to land will apparently become a marvel of simplicity, and the system of mortgage will seemingly be much facilitated. A sketch of the existing mortgage system will serve as an introduction to a sketch of the forthcoming system.

Existing mortgage system.

145. The mortgage law orders the keeping of mortgage registers, and the entry therein of every landed property, with notices of all subsequent dealings with it. The entry should declare—(1) the actual owners of the property, the right to possession, and the value of the property; (2) the limitations of right to disposal, the permanent real obligations and charges; and (3) the partial or temporary real obligation or debts or charges. It must, however, be borne in mind that this entry was not an obligation of the public law, but a requirement of the private law. By the comprehensiveness of the entry, however, the mortgage register became also a register of inheritance and of rent-charges. This register was the outward manifestation of the principle of publicity. The Body of Law developed the principle of specificity and of priority. The Prussian law of mortgage recognizes, like the French law, the mortgage by contract, the mortgage at law, and the judicial mortgage. The entry of the mortgage at law is absolutely necessary to protect the rights of third persons, such as wives and minors. But the Prussian law unlike the French law, recognizes no silent mortgages which cannot exist where the principles of publicity and of specificity prevail. The law of May 24, 1853 contains the last amendments made in this system.

146. The following are the chief features of the system. No mortgage is legally valid until it is entered in the register. The mortgage must be upon a specific estate. The mortgagee must elect in cases of exchange of parcels of land, whether he will retain his right to the old parcels or pass it to the new parcels. The mortgages rank according to date of entry. The registers are kept by the departmental authorities for privileged estates, and by the town authorities for other estates. The mortgage Judge (the mortgage procedure is distinct) is responsible for the outward legality of the entry in all its details,

but not for the inner legal rights of the interested parties. As regards entry of title, if an estate is already entered, the new purchaser or acquirer needs only to be provided with previous entries in a kind of legal recital, which has been shortened by modern legislation. If an estate is not entered, then the title can arise from purchase at a compulsory sale at law, from barring of all claims by the exercise of the powers of challenging claimants, or from quiet possession for ten years after proof by certificated evidence before public authorities of a suitable title, or from quiet possession of owner and his predecessor for ten years under similar conditions of previous proof. A mortgagee can enforce his rights by foreclosure ("Immission"), sequestration, and compulsory sale at law ("Subhastation").

Defects of it.

147. The following are the chief defects in the Prussian mortgage system, at any rate for the changed condition of landed property and of agriculture. It prescribed no sufficient details of the area and other important matters, but required merely the general indications which distinguish the mortgage property from others. This suited the old system, but is useless for small properties. It did not place the essential condition of the mortgage in its entry. The land registers are very defective. The procedure is protracted and costly. It contradicted in some points its leading principles of publicity and speciticity. It has many defects of a more technical character. It created complication and delay where simplicity and dispatch are needed, and this tended to render unfavourable the competition of real credit with other kinds of credit.

The above brief summary has been kept as free as possible from the difficulties of the law, but the most careful tread may not have avoided all the pitfalls.

Special mortgage Low districts.

148. It must be noticed that this mortgage system does not obtain in New Pomerania and Rügen where the principles of German common law prevail, and where a system of great simplicity obtains. That system has, however, its defects, and a reform was laid before the provincial Diet last year, and has passed into law. Neither does the Prussian mortgage system obtain in the Rhine Province on the left banks, where the Napoleon code reigns supreme. No important change has been made in the French law of mortgage; but drafts of laws for improving and amending that mortgage system have from time to time appeared. These drafts have aimed mainly at the establishment of land registers, at the increase from ten to thirty years of the period for renewal, at the abolition of the silent mortgage, and at the restriction of the mortgage to the property held at the date of, and named in, the body of the mortgage. Parenthetically it may be recorded that a thorough reform of the mortgage system has in Prussia been opposed by many of the Roman jurists, and by the large landowners, as a class, though not by individuals, and has been unsupported by many persons from a want of acquaintance with the principles of political economy, which in preference to long descended principles of ancient law, must eventually be decisive of the laws of the future.

Proposed mortg system.

149. Of the two new Bills, one establishes the land registers ("Grundbücher"), and the other lays down the law of title and mortgage. These Bills are drawn on the assumption that a uniform law of title and mortgage will be desirable for the German Confederation, and in the hope that the Prussian Bills will ultimately be Federal Bills. They have the great positive merit of revising the principles of the law, and the negative merits of following neither the civil law nor the German common law, and of not attempting to amend existing laws, an amendment which is usually a makeshift and no reality. They consequently deviate essentially from many an important part of existing law. The leading principle of the Bill on title and mortgage is, that entry in the land register is the only proof of title. Consequently, the first section on title declares that entry in the land register alone gives the title on a voluntary alienation, and that this entry takes place on the demand of the acquirer and with consent of the registered owner, and the renunciation thereby acquires perfect legal validity. If, however, the title of the registered owner be assailed and destroyed, the rights of third persons, who have acquired these rights in the meantime in reliance upon the accuracy of the land register, remain unimpaired, unless protested against at the beginning by the assailer of the title. No restrictions affecting the registered owner can affect third persons, unless these restrictions are entered in the land register. If the registered owner sell the property to several persons one after the other, he only is the new owner who is entered in the land register, even if he have acknowledged the prior right of another, or if the latter have received the estate from the seller. This clause cuts away all the perplexities and confusion of the doctrine of *mala fides* and *bona fides*. Can title to land be rendered much more simple? The second section, treating of the founding of real rights on landed estates, declares that entry in the land register can alone found them, except in some obvious cases which require no entry. The third section lays down the right of mortgages as arising solely from entry in the land register, which takes place on the demand of the registered owner or the mortgagee or of a legally appointed authority. The entry must contain the name

of the mortgagee, a distinct description of the estate mortgaged, a fixed amount of loan in legal currency, the rate of interest, the date from which interest runs, and the covenant as to arrears. No reservation of the title to the owner can take place unless the mortgage contain a fixed sum of money. The owner can register a mortgage in his own name, and he thereby acquires the right to dispose as he will of it, and to be a mortgagee against third persons. The right of the mortgagee attaches to the entire property, with buildings whether erected later or not, with all natural accretions, with standing and hanging crops, with rent and other incomings, and with any inscribed movable property. The priority of mortgages is solely decided by the date of registration. Limitations affecting the right of the mortgagor have no effect upon the right of mortgagees, unless they had been registered. A mortgagee, who is likewise a personal creditor, can select the personal remedy, or the remedy of a mortgagee. When the owner is both, he can use both remedies. The mortgagee can resort to sequestration and to compulsory sale at law of the mortgaged property or mortgaged part of the property. The owner can bid at the public sale on paying down the amount of his bid in cash each time. If he remain the highest bidder he receives the property free from mortgages, even if his bid do not reach their amount. The purchaser at a compulsory sale at law acquires the property, not only free from mortgages but free from all other charges or incumbrances whatever, with a few formal exceptions of a private source. The transfer of a mortgage need not be registered except on demand of the mortgagee, or of a duly appointed authority. The owner of the property can transfer the mortgage in his name without naming the acquirer. (Transfer *in blanco, i.e.*, blank transfer.)* Each acquirer has the right to insert his name, if he choose. In default of any other arrangement the costs are paid by the mortgagor. The mortgage is annulled only by cancelling it in the land register on the demand of the landowner or of a duly constituted authority. The clauses which are not hereinbefore epitomized are mainly of a formal nature.

150. It is obvious what a gulf yawns between this new mortgage and the old mortgage system. It is also evident how much this new law will facilitate mortgage operations, and thereby remove obstacles to the development of real credit. The language of the original is so clear and precise and compact that the summary is scarcely shorter than the original. There seem to be some apprehensions of the effect of mortgages to bearer, for the concession in this direction is limited to the landowner's own mortgages, and to such mortgages *in blanco*.

151. The other Bill treats of the land-registers in respect of their outward forms, of the offices of registry, of the procedure and of the documents. The procedure is simple. sts. So-called mortgage certificates ("Hypothekenbriefe") will be issued. The costs are fixed at a low rate; they seem to be about $1\frac{1}{3}$ per cent. up to 30*l.*, $\frac{1}{3}$ per cent. from 30*l.* to 150*l.*, and $\frac{1}{10}$ per cent. above 150*l.* All the necessary forms are appended to the Bill.

(γ.)—*The System of Compulsory Sale at Law.*

form of compul- y sale at law. 152. By the system of compulsory sale at law is meant the legal system by which a mortgagee can compel a public sale of the mortgaged property to recover his loan, or by which, for instance, a co-heir can compel such a sale of the co-inherited property. It is applicable to real property and to the pledging of ships by bottomry. This system was reformed in the last session of the Prussian Parliament. This reform is certainly advantageous to real credit; the procedure is shortened, simplified and cheapened. A main cause of this result is placing all such affairs under the directions of a distinct and independent judge, whose powers are carefully defined. Creditors are protected against fictitious bids, &c. The recourse to compulsory sale is less obstructed and the process is less assailable than under the old system. Contradictions and confusions are removed by the application of simple principles of equity apart from traditional learning, and delays are lessened by various provisions promoting a due despatch of business.

It is unnecessary to sketch the old system, but it may be noticed that the objectionable feature of a valuation of the property by the court, and of the withdrawal of the property unless the highest bid should reach the amount of the valuation, has disappeared.

sts. 153. The costs of the new system are on the highest bid, 2 per cent. up to 75*l.*, and $\frac{5}{6}$ per cent. from 75*l.* to 300*l.*, $\frac{1}{3}$ per cent. from 300*l.* to 3,000*l.*, and $\frac{1}{6}$ per cent. above 3,000*l.* The stamp duty is 1 per cent.

(δ.)—*The Real Credit Institutions.*

154. These are of many kinds, but in the first rank are the mortgage debenture associations. The real credit institutions comprise also the provincial loan funds

* These approach very nearly to debentures to bearer.

("Hülfskassen"), the savings' banks, and many other banks and institutions which promote, more or less directly, the activity of the landowner and agriculturalist, by offering facilities of money capital. Of the provincial loan funds I unfortunately possess no information at present beyond the reference in the ζ section of the α subdivision of this part of the report to the grant of subsidies from the State to certain provinces, which seem to have constituted the commencement of such institutions. The rent-charge banks are included in this section because they practically contributed to the maintenance of real credit, as also to the facilitation of the transition from the old to the new agricultural organization. The savings' banks are also included because they appear to lend their money mainly upon mortgage. The materials at hand, with respect to these and other real credit institutions will be found condensed in the following paragraphs.

(1.)—*The System of Mortgage Debentures.*

155. This is peculiarly a Prussian system, and these associations for their issue have many of them existed for nearly a century. That system, like many another advantageous institution or law, arose in the reign of the penetrating Frederic the Great. In 1769 the Silesian Association was founded; its leading idea was "that the landowners belonging to the associated district should form an association by which they made themselves mutually responsible to provide for every landowner money to half the taxed value of his property, and to pay every creditor who had a mortgage debenture not only the half yearly interest, but also the capital upon six months' notice." The advantages of this system of self-help are obvious. The favourable results of this institution soon became known and the associations of Pomerania, of Kurmark and Neumark, of West Prussia and of East Prussia, were founded in 1781, 1782, 1787, and 1808, respectively. All these institutions had for their object to make advances to the nobles and large landowners for the promotion of agriculture. The first exception in favour of other properties was in the East Prussian Association. The principles common to all were, that every owner of a privileged estate could claim a loan, and that such a loan should be granted in debentures to bearer to half (in East Prussia to two-thirds) of the taxed value of the property. The debentures were usually in two categories, at 4 per cent. and $3\frac{1}{2}$ per cent. The mortgagor had to sell them in order to get his loan in cash. The debentures contained a description of the estate upon them, and they were guaranteed by the whole association. The mortgagor paid the interest to the association who paid it to the creditor. The association could not give notice either to the creditor or the debtor; but the former could give notice to call in the money. The compulsory sinking fund did not at first exist in all, but is a most advantageous principle of most of these associations. It has doubtless been productive of immense benefit. In the Posen Association it took the form of 5 per cent. charged to the debtor, and 4 per cent. paid to the creditor, the 1 per cent. being devoted to a sinking fund with a period of 41 years. The plan was similar in the other institutions, but the sinking fund varied in form. The method of valuation varied much also. In later times peasant properties have either been admitted to the associations, or special associations have been formed for them. In addition to the above mentioned associations a Royal Credit Institution was founded in Silesia in 1835, a new association for Posen in 1857, a new West Prussian Association in 1861, and an association for Saxony in 1864. Some of the modern associations accept properties of a very low value, such as those bringing in a net income of 7*l.* 10*s.* a-year. In the modern ones there has also been a different apportionment of the interest paid by the creditor, for a fixed per-centage, usually $\frac{1}{2}$ per cent., has been retained for expenses of management.

Rise of system.

Principles.

The differences between this system as established by the direct and indirect action of the Prussian law and the Mortgage Debenture Act of 1865 of English law, need not be pointed out here.

(2.)—*The Rent-Charge Banks.*

156. The faculty of commuting rent-charges and services by money instead of land payment, which was offered by the first national National Agriculture Laws, was of comparatively little use. It became obvious that the object of commutation could not be attained unless the legislation provided means for furnishing with the necessary sums of money those of the peasants who had no capital with which to obtain the commutation. Hence rent-charge banks were established in 1850, Saxony having led the way in 1832. The object of these banks is to pay for the peasant the commutation capital, receiving from him in return an annual sum which shall pay interest and shall gradually pay off the

Object of banks.

capital advanced. The peasant debtor is allowed to pay in during the sinking fund period any sums, however small, to accelerate the extinction of his rent-charge.

ciples of organization.

The basis of this legislation is the law of March 2, 1850, for the establishment of rent-charge banks. It commences by directing the establishment of a rent-charge bank for each Province, and by stating the mode of attaining the object in view. It was decided after deliberation, that provincial banks were preferable to a central bank. The law grants the State guarantee to the fulfilment of all the obligations undertaken by the bank. This guarantee involves no pecuniary sacrifice but strengthens the credit of the banks. The banks are under the supervision of the Minister of Finance and the Minister of Agriculture, and are co-ordinate with the Special Procedure Authorities, and are carried on by a director and the necessary staff under the control of the Provincial authorities. In all cases of commutation by means of the bank the commutation debtor needs only to pay nine-tenths of it to the bank, for one-tenth can from the first day be written off. But he can elect to pay the full amount, and thus shorten the period of repayment. In cases of arrears he has to pay a special yearly sum equal to one-twentieth of these arrears to liquidate them.

The rent-charges are preference claims upon the land. This claim is not, however, to interfere with subdivision of the land, as it is to be distributed according to the rule for taxes. The rent-charges can be paid in monthly instalments with the taxes. It is the custom in Prussia to collect taxes in monthly instalments. The periods of repayment are 673 months when the tenth of the total commutation capital is written off; and 493 months when the total commutation capital is to be repaid. Payments of capital may be made at any time in acceleration of the extinction of the charge, and for this purpose tables are annexed to the law. It was not deemed necessary to fix a minimum sum below which no such payments would be received, as no use had been made of the faculty to pay in such low minimum sums as 6*d.* in the Eichsfeld Sinking Fund Associations, and as 1*s.* in the Land-rent Charge Bank of Saxony.

The receiver of commutation obtains from the Bank a capital sum of twenty years' purchase of the rent-charge. This is paid in rent-charge debentures of a fixed amount, and the fractions beyond such an amount are paid in cash. There are debentures of 1,000, 500, 100, 25, and 10 dollars, bearing interest at 4 per cent. in half-yearly payments. Coupons for eight years are attached, and these are renewed as may be necessary. These coupons are payable in cash and are legal tender in all Government offices. The payment of coupons is barred in favour of the bank by the lapse of four years. The difference between the 4 per cent. interest on the debenture and the $4\frac{1}{2}$ or 5 per cent reserved as rent-charge, is to be applied to the extinction of the debentures. Every half-year after the first year so many debentures must be paid off in full by drawings as shall amount to the sum of the cash receipts from the above difference, and the commutation capital paid in during the half-year. After ten years the payment of drawn debentures is barred in favour of the bank.

The law contains some special directions respecting the rights of third persons. A reserve fund is formed by interest on cash balances and by the barring of coupons or debentures. This reserve fund is to be applied to replacing loans of the general fund, and whenever it does not suffice the State pays the difference. The State undertakes the cost of management. A period can be fixed after which the banks shall undertake no more commutations. The law of April 26, 1858, directs the manner in which this shall be done, and the notice of January 31, 1839, of the Ministries of Finance and Agriculture, fixed the 31st of December, 1859, as the last day for effecting commutation through the banks.

The law concludes with some special stipulations respecting the Sinking Fund Associations which existed in the Kingdom and assimilates them to the rent-charge banks, and with some clauses respecting any commutations undertaken by the State.

(3.)—*The other Banks and Institutions.*

157. The law of the land has only an indirect influence in bringing such institutions into activity, but, as the freedom of association allowed by the law conduces to their establishment, and as they are founded for the purpose of assisting real credit, they require a short notice. Of these there are about nine, of which it will be desirable to give the results in the corresponding sub-division of the next division of the Report. They are founded as joint-stock associations, and are destined to business solely or mainly in mortgages. As yet they do very little for real credit. The Prussian association for the insurance of mortgages deserves special mention. It tests the security for the mortgage, and then insures the mortgage against loss by undertaking all risks on payment of a fixed premium. But it is to be presumed that no holders of good mortgages would try to insure.

(*f.*)—*Supplementary Sub-division.*

158. In order to render more perfect the foregoing outlines of the legislation affecting land, it would be necessary to inquire into the taxation affecting land and into the laws affecting the agricultural labourer as a labourer, as well as into some other subjects more indirectly affecting the land question in every country. But the scope of this part of the Report cannot be extended to such matters, neither would the time allow of even a cursory inquiry into their legal incidents. It will suffice to record, that the taxation affecting land is stated to be unduly heavy, and that, although the legislation cannot be examined here, the incidence of the taxation will be referred to in the subsequent part of this Report; and to record that the position of the labourer is better than it was, and that, although the laws affecting him cannot be here noticed, his position in the agricultural economy will likewise receive subsequent attention.

(C.)—The Results of the Legislation affecting Land.

159. When the question of what are the laws has been answered, the still more important question of what are the facts presents itself. It is true that laws and facts react upon each other, but no law can be without its consequent facts. Therefore the laws being ascertained, what are the results produced by them? In a word, what has been the effect of each force set in motion, and what has been the effect of the resultant of all the forces in motion? Both parts of the question are important; and the latter is quite as important as the former. For, in estimating the effects of a given legislation, it is of great importance to obtain the best possible idea of the aggregate effect of the direct action of each part of that legislation, and of the indirect action of each part of other legislation. It is consequently of equal importance to try to ascertain what has been the separate effect (however restricted it may have been by the influence of other forces) of the action of each part of a given legislation. Accordingly it is purposed now to try to ascertain, however imperfectly, the direct results of each part of the legislation affecting land, which has been treated of in the previous division of this Report. But any such results which would more naturally be arranged in the following parts of this Report will be left for subsequent appreciation. What are the facts

These direct results are to be ascertained from statistics and general observations. No doubt statistics are but dry bones, and require not only to be fitted into a harmonious frame but also to have the breath of life breathed into them. Still the skeleton must be known, before the anatomy of the entity can be understood.

Unfortunately, statistics as to the result of this legislation affecting land are not in Prussia as complete as they might be. Yet they, no doubt, exceed in completeness those of other nations on similar subjects. In regard to some parts of the legislation they are more or less perfect, but in regard to other parts they are lamentably deficient.

(*a.*)—*The Results of the Laws of National Agriculture.*

160. In regard to the results of the laws of national agriculture the statistics are not as complete as they could be made, or as it is desirable that they should be made. It is intended, with respect to these results to follow in the main the delineation of them in Dr. Meitzen's official publication. He considers it impossible to give a clear picture of these results, but avails himself of the statistics furnished chiefly from the protocols of the General Commissions. Whether, however, in any given district there has been a complete removal of all hindrances to agriculture arising out of the former system or only a partial removal is not at present known by the statistics and the official information.

It will be desirable to arrange these results according to the arrangement of the laws themselves into sections in the previous part of this Report, and accordingly to separate this subdivision into five sections.

(*a.*)—*The Results of the Abolition of Real Charges and Services.*

161. It will have been inferred from this sketch of the laws that they divide themselves into the laws from 1809 to 1848, and into the laws from 1848 to the present day, inasmuch as 1848 is the date of an essential change in the practical application of the principles of this legislation. It will therefore be necessary to consider the results obtained from 1809 to 1848, and the results obtained since 1848. The former, again, divides into two parts at 1820, when some important alterations were made.

As regards the results in these periods the following Table contains the chief points

of interest. The Table does not include the affairs settled by the Crown direct in respect of Crown peasants or of the forest services. It will be observed that the Table is commenced by giving the aggregate area, and a special area of the provinces for purposes of comparison with the area of land affected by the legislation. It is naturally impossible to ascertain what was the aggregate average of all peasant lands in 1807. This can only be estimated on very insufficient bases of computation. It is assumed that the peasant lands consisted in the main of tillage, meadows, orchards, and kitchen gardens, and the special area is the aggregate of these kinds of cultivated land together with the building sites and house gardens. Of this special area the peasants were probably in possession of about a fifth. This estimate will be subsequently referred to, but the special area is now inserted in the Table in order that some idea may be formed of the relative quantity of more or less cultivated land which was regulated under this legislation by the direct intervention of the Special Procedure Authorities, and without private arrangement either between individuals or between the Crown peasants and the Crown authorities.

TABLE showing the Results of the Legislation for the Regulation of Property Relations, and for the Abolition of Real Charges and Services, as obtained by the Direct Intervention of the State Authorities.

	Unity.*	Period 1807 to 1820.					Period 1820 to 1848.					Period 1848 to 1865.					1807–65.

* The morgen, thaler, and scheffel of the Prussian Statistics, are converted into acre, £ sterling, and bushel respectively, in the following proportions: 2 acres equal to 3 morgens; £1 equal to 6⅔ thalers; and 3 bushels equal to 2 scheffel.
‡ The divisors are 9, 28, and 15 years respectively, as being the number of working years in each period.
‡ The exact figures in days are unknown, but the services of each kind abolished were about 1,500,000.
§ Of these only 56 and 59 respectively belong to the Rhine Province, and of those in the next period not one day belonged to the Rhine Province.

Statistics of Regulation.

162. The blank spaces of the preceding Table are as instructive as the occupied spaces. There was no regulation of property relations required in the western provinces, and only three peasant properties were found in Saxony to require regulation. But the introduction of French Law had not been followed by a similar disappearance of real charges and services. It had, however, resulted in almost entirely freeing the Rhine Provinces from them, and in materially diminishing their number in Westphalia and Saxony. In the provinces in which this official regulation was needed, it embraced a ninth of their special area and a sixteenth of their total area. It is interesting to note the average sizes of the properties dealt with in each period. They decreased in size each period. This was in the main owing to the early influence in the first period of the Declaration of 1816, and to the later influence of the gradual relaxation of the restrictions of that Declaration and of its final abolition by the legislation of 1850. In Silesia the decrease in size is remarkable, for before 1850 the greater number of the peasant properties had been excluded from regulation; and it is surely not unwarrantable to infer that the effect of the Declaration was to cause many of the smaller peasant properties to disappear, although, on the other hand, a large number survived to benefit by the legislation of 1850. Another phenomenon was caused in "the other four provinces," especially Prussia, by the Declaration. In them it excluded, by its condition as to payment of land-tax, many a team-requiring farm from regulation till after 1850. Hence the fact that the average size is not so much diminished as in Silesia. These remarks apply, *mutatis mutandis*, to the annual amount of regulation both as to number of owners and to the area of their land.

Of real charges and services.

163. As to real charges and services abolished it will be observed that about one-half of the days of team and hand services were abolished in Silesia alone, scarcely a fortieth in the Western Provinces and Saxony, and the remainder in "the other four provinces." As to compensation granted it may be inferred that the peasants of Saxony and the West Provinces were the best able to pay commutation capital in money, that the peasants of Silesia followed in pecuniary ability, and that "the other four provinces" were far poorer and less able. The commutation was paid in land to only a very small extent in the West Provinces, to a small extent in Saxony, to a greater extent in Silesia, but to a much greater extent in the other four provinces.

Peasant land affected.

164. It may be of some little interest to obtain an idea, however imperfect, of the quantity of peasant land affected altogether by the regulation of property relations. For this purpose it can be assumed that the peasant lands requiring regulation bore to other lands in the "special area" the ratio of one to five, and of those requiring regulation in Silesia of one to ten. On this assumption the following computation can be made:—

	Special Area.	Peasant Land.	Officially Regulated.
	Acres.	Acres.	Acres.
Silesia	6,844,610	684,461	203,623
The other four Provinces	26,667,707	5,333,542	3,467,317

It must, however, be borne in mind that this Table is only a very rough estimate. In Silesia, too, there is little doubt that of the properties requiring regulation many were destroyed before the legislation could help them, and hence that the whole of the balance does not belong to the category of private regulation.

Work nearly ended.

165. The following Table will show how very nearly the task of Prussia in this part of the Agricultural Legislation has been accomplished.

TABLE of Property Regulation and Abolition of Rent-Charges and Services in 1866-68.

	Regulation.		Abolition of Charges, &c.			Compensation granted.			
	No. of Owners.	Area of Land.	Persons who have Commuted.	Team Service.	Hand Service.	Capital.	Money Rent Charge.	Rye Rent Charge.	Land.
	No.	Acres.	No.	Days.	Days.	£	£	Bushels.	Acres.
1866 ..	12	113	44,186	610	6,597	63,059	8,085	8,103	1,012
1867 ..	135	685	66,184	1,015	11,485	56,328	10,264	7,363	415
1868 ..	55	456	43,371	354	3,798	54,842	5,602	7,815	338
Total ..	202	1,254	173,741	1,979	21,880	174,229	23,951	23,281	1,765

This Table does not include the affairs settled by the State direct, but only those settled before the Special Procedure authorities. Neither does it include the affairs which have been settled in the new provinces in which the Prussian Agricultural Legislation has been able to find work to do.

Regulations by Province.

166. If, in respect of regulation of property, the province be regarded by number of

regulated owners and quantity of regulated land, Posen is first with a fourth of the whole, Silesia comes next, and Pomerania follows. If, in respect of abolition of real charges and services the provinces be regarded, then Silesia and Saxony take the first place; and it is curious to remark that the provincial district of Coblentz was burdened with a relatively considerable number. No comparison can be made as to the number of persons thus freed, for in many provinces the same persons appear twice or more on account of various successive abolitions of the charges affecting them. In regard to team and hand services, the figures are more trustworthy, and Silesia and Posen take the first place. With respect to these services, Dr. Meitzen remarks that if a depreciation of a fourth be allowed for the bad labour and the waste of time in a day of forced labour, the natural gain in labour is $1\frac{1}{3}$ millions of days of hand labour, and $5\frac{1}{3}$ millions of days of team labour; and he estimates the gain at a minimum of 750,000*l.* a-year. He computes the aggregate commutation capital of the regulations of property relations and of the abolition of real charges and services at 213,861,035 dollars, or about 28,514,805*l.* sterling.

The figures given in the preceding outline of the work accomplished by this part of the legislation indicate strikingly the direct results of that legislation.

167. It may be noticed before passing to the next section, that the ecclesiastical charges (tithes, &c.) are as yet uncommutable. In Silesia alone are they commutable. The legislation on the subject in that province is interesting; especially on account of the increased difficulty of the question from the mingling of religions.

(β.)—*The Results of the Commutation of Rights of Common.*

168. Of these, the official figures are so complete as to bear striking testimony to the direct results as well as to the necessity of this branch of the legislation. The following Table resumes the chief points of interest:—

	To end of 1848.		From 1848 to 1865.		1866 to 1868.		Total.	
	Owners.	Area.	Owners.	Area.	Owners.	Area.	Owners.	Area.
	No.	Acres.	No.	Acres.	No.	Acres.	No.	Acres.
The Rhine Province ..	5,297	72,396	17,955	32,183	1,601	26,864	24,853	131,443
Westphalia	85,404	907,687	66,203	808,619	5,369	78,417	156,976	1,794,723
Saxony	362,990	3,503,738	226,164	2,177,968	23,582	188,316	612,736	5,870,022
Silesia	110,390	3,552,857	98,307	1,301,696	32,074	451,306	240,771	5,305,859
Posen	64,368	4,599,495	33,903	2,102,059	3,347	263,712	101,618	6,965,266
Brandenburg . ..	187,714	5,051,977	61,617	1,483,023	7,734	135,203	257,065	6,670,203
Pomerania	40,470	3,579,122	49,739	1,185,732	4,535	210,011	94,744	4,974,865
East and West Prussia .	129,003	7,219,777	60,841	2,320,083	4,415	198,615	194,259	9,738,475
Total	985,636	26,487,049	614,729	11,411,363	82,657	1,552,444	1,683,022	41,450,856

If the number of possessors of this Table be compared with the number of proprietors and others engaged in agriculture, it will be seen that the influence of this branch of the legislation has made itself felt in nearly every agricultural homestead. I am informed that a twentieth more work has still to be done, so that the total number of acres affected by rights of common reached to the large quantity of 43,488,960 acres—more than half the aggregate area of the kingdom, of which 41,418,060 acres have already been freed. It will be remembered that the rights of common included a large number of extremely prejudicial rights. And in most cases, whether or not the right was prejudicial, the exercise of it involved much agricultural loss in numerous ways. It is, however, impossible to estimate even approximatively the gain to the nation from this extinction of rights of common.

Great extent of rights of common.

169. There appear to be no general statistics on the subject of consolidation, but it is hoped that some information on this point will be gathered for the last part of this Report. Dr. Meitzen has, however, given the details of a calculation of the advantages resulting to the districts of Grossengottern and of Alterngottern. This calculation shows an annual economy or extra profit of about 6*s.* 9*d.* per acre upon an outlay or cost of 15*s.* 9*d.* per acre. This cost was unusually high in consequence of the necessity of considerable drainage works; but even upon it the returns are 42 per cent. The compulsory consolidation has been beneficial not only in Saxony but in Pomerania, Posen, and especially Prussia. But whenever this compulsory consolidation is separated from the separation of commons and extended to the whole kingdom, there will, it is said, be much work for it it to accomplish. I am informed that in Silesia alone there are 2,000,000 acres of separated and intersected lands.

Advantages of consolidation.

170. To conclude in the words of Dr. Meitzen, the consolidation of lands has in the northern provinces been long hailed as a large and beneficial improvement, and the

Memorandum of November 1859, which was composed in the Agricultural Ministry on the State measures taken for the advancement of National Agriculture in Prussia, could with reason say, "The expected effects of the agricultural laws have not failed to follow; instead of stagnation there is a gladdening stir amongst the agricultural population; the accomplishment of separation of commons has enabled large and small landowners to bring their lands by manifold improvements into a higher state of cultivation, and to increase by an advantageous expenditure, their returns."

(γ.)—*The Results of the Dismemberment Legislation.*

171. The State endeavoured in 1838 and in 1852 to obtain such statistics as should show the results of the dismemberment legislation, but the returns were too defective to give an accurate idea of them. It may, however, be noticed that on a comparison of 1851 with 1837 the team using properties (not privileged) seemed to have increased in numbers by 4,214, but decreased in quantity. A more thorough inquiry was advocated in 1859 and was eventually carried out. In order to draw a line between the quite small holdings and the farming holdings the test of using a team was applied. This definition was, however, not very decisive, for the question arose as to what constituted a farm requiring the use of a team. Then too, the quantity of land in a team-using farm varied much in every province. For instance in the Province of Prussia a holding of twenty acres was considered team-requiring, yet in Posen and elsewhere a holding of ten acres was so considered. By team-requiring is usually meant a farm requiring at the least two horses or three oxen, but the term is rather elastic. Farms using one horse or two cows seem to be excluded.

Line drawn between large and small peasant properties.

172. The general movement of the peasant farm lands from 1816 to 1859 was for the six eastern provinces (exclusive of the Provincial District of Stralsund) and for Westphalia, as follows:—

	Of the Team-requiring Peasant Farms.										Small Holdings.	
	In 1816.		In 1859.		Movement.				Average Area.		In 1859.	
	No.	Area.	No.	Area.	Number decreased.		Area.		1816.	1859.	No.	Area.
		Acres.		Acres.	No.	Per cent.	Acres.	Per cent.	Acres.	Acres.		Acres.
Prussia	84,517	6,784,282	82,837	6,736,581	1,680	1·98	− 47,701	0·70	80	81	74,628	335,549
Pomerania	21,371	1,997,847	19,793	1,734,475	1,578	7 38	− 263,372	13·18	93	88	30,258	324,181
Posen	48,151	2,306,454	48,008	2,249,693	143	0·29	− 56,761	2·46	48	47	34,084	199,867
Brandenburg	51,073	3,754,119	49,652	3,618,584	1,421	2·78	− 135,535	3·61	74	73	61,556	287,872
Silesia	69,592	3,128,584	69,303	2,427,903	289	0·41	− 700,681	12·80	45	33	207,275	812,967
Saxony	40,976	2,559 553	39,229	2,604,723	1,747	4·26	+ 45,170	1·76	62	66	101,131	470,796
Westphalia	35,927	2,419,716	35,915	2,660,300	12	0·03	+ 240,584	9·94	67	74	95,569	791,330
Total	381,607	22,950,555	344,737	22,032,259	6,870	1·95	− 618,196	2·69	65	65	604,501	3,222,562

Decrease of peasant farms.

It will be remarked that the team-requiring properties have decreased both in number and acreage, but that the average size of a property remains the same. Unfortunately there are no means for instituting the same comparison in respect of the small holdings in contradistinction to the team-using holdings. But it may be assumed that such holdings have decreased since 1816 in consequence of the definition in that year of the peasant properties to be regulated. It will be further remarked that whereas, in Pomerania the decrease in number was 7·38 per cent. it was only ·03 per cent in Westphalia. But whereas in Pomerania there was a decrease also in acreage of 13·18 per cent., there was in Westphalia an increase of 9·94 per cent. This seems to point at absorption in Pomerania by owners who are not peasants, and at consolidation in Westphalia by owners who are peasants. In Silesia again the loss in number is small, but the loss in acreage is in quantity half as much again and by per-centage nearly the same as in Pomerania.

If then these figures represent the whole truth, the better class of peasant properties (including therein all properties not consisting of privileged or large town lands, and including, therefore, all the yeomen and most of the middle class proprietors) has lessened in numbers and become possessed of less acreage But it does not follow that they are in a worse position than before, for the present acreage may be and probably is far more valuable than the former acreage.

173. From another Table—the result of that inquiry in 1859—it will be seen that the team-requiring properties had received in the period from 1816-58 from property regulation and from commutation an agregate of 565,045 acres or 2·42 per cent. increase. Hence such properties have lost that aggregate also—making a total decrease of 1,183,241 acres or a total loss of 5·11 per cent.

	The Team-requiring Farms have					
	By Regulation ceded.	By Commutation received.	By separation of Commons.		As total result.	
			Received.	Lost.	Gained.	Lost.
	Acres.	Acres.	Acres.	Acres.	Acres.	Acres.
Prussia	153,843	30,266	367,333	49,916	193,940	..
Pomerania . ..	161,544	13,184	96,242	8,474	..	60,592
Posen	40,587	47,376	40,980	1,313	46,456	..
Brandenburg ..	154,960	17,186	202,060	16,738	47,548	..
Silesia	154,599	31,703	25,611	8,961	..	106,236
Saxony . ..	10,231	5,668	132,832	4,177	124,592	..
Westphalia . ..	610	268	319,897	222	319,337	..
Total ..	676,374	145,651	1,184,955	89,801	731,873	166,828

Therefore, the gain is equal to 565,045 acres, or 2·40 per cent.

It is to be remarked that the figures of this Table are defective—chiefly in this, that some farms were returned at their sizes after regulation or separation without stating the gain or loss by the operation. By the commutations and by the separation of commons 3,003 small holdings had become team-requiring farms. On the other hand 430 originally small farms had lost so much land that they were no longer team-requiring.

Result of dismemberment.

174. The next question answered by the 1859 inquiry was, as to what had been the result of the free trade in land in consequence of the dismemberment legislation upon the peasant holdings. By the division of larger farms into several team-requiring farms the number of proprietors would be increased without increasing the acreage. On the other hand by consolidating several small team-requiring farms into one large farm, the number of proprietors would be lessened without increasing the acreage. But if peasant farms were absorbed into the privileged properties, that would be a clear loss to the aggregate of peasant proprietors and of peasant property. If too peasant farms were distributed amongst the small peasant holdings, it would be a loss to the aggregate of peasant farmers and of peasant farms. On the other hand privileged properties might be split up into peasant properties, and small peasant holdings might by consolidation become peasant farms. And thus there are many counteracting influences at work of which the nett result has to be ascertained. From the inquiry of 1859, it appeared that the number of peasant team-requiring farms had—

		Per cent.
By consolidation diminished	20,105 or	5·7
And by dismemberment increased	10,232	2·9
Being a total decrease of	9,873	2·8

That the acreage of such farms had—

	Acres.		Per cent.
By absorption into other properties lost	597,186	or	2·60
By dismemberment lost	577,240		2·51
Being a total loss of..	1,174,426		5·11

This loss has been already estimated in the previous paragraph of this report and the figures confirm each other. It further appeared that no fewer than 5,487,948 acres of peasant farms or 2·391 per cent. had been set in movement. Of these 2,920,879 acres or 12·72 per cent. remained in team-requiring farms, 1,870,748 acres or 8·15 per cent. entered into small holdings not requiring teams, or into other than peasant possessions; and the remainder of 694,960 acres, or 3·03 per cent. was obtained by the team-requiring farms other than peasant farms.

The following Table will show various particulars of these results of the dismemberment legislation, as ascertained in 1859 :—

	Team Farms broken up by Subdivision.			New Team Farms from Free Exchange.			Team Farms.			Average Size.		Broken up Farms went—						Dismembered Portions.			Set in Movement by Dismemberment.	
	Area.			Area,			Increase.	Decrease.	Per Ct.	Broken up.	New.	To Non-Peasants.		To other Team Farms.		To non-Team-requiring Holdings.		To Non-Peasants.	To other Team Farms.	To Small Holdings.

Gain ..	..	..	..	..	..	..	74,602 or 1·94 per ct.															

Two remarks affecting the accuracy of this Table were made. The first was that, as all dismembered portions of which the returns left the destiny doubtful, were placed to the account of the small holdings, the number and quantity of peasant farms absorbed by them may be less than these in the Table. The second was, that in consequence of the constant movements of land in Westphalia and Saxony the figures for those provinces are not altogether exact, for it is impossible to follow such rapid changes of possession.

Influence of sub-division on inheritance.

175. Another interesting point is the influence on the position of peasant properties of the faculty of sub-division by will and of the intestate sub-division. The influence of the latter is small, for it is the custom of the peasant to make a will. The following Table, in which however there is some incompleteness—for only those sub-divisions which could in the returns be with certainty traced to inheritance are included, gives the information afforded by the 1859 inquiry.

	New Team Farms.			Team-requiring Farms broken up.			Average Size.		Ceded to Small Holdings by Team-remaining Farms.		
	In General.	By Sub-division on Inheritance.	Proportion to General.	In General.	By Sub-division on Inheritance.	Proportion to General.	New.	By Sub-division on Inheritance.	In General.	By Sub-division on Inheritance.	Proportion to General.
	No.	No.	Per cent.	No.	No.	Per cent.	Acres.	Acres.	Acres.	Acres.	Per cent.
Prussia	11,918	619	5·19	4,295	69	1·60	41	48	99,761	1,874	1·87
Pomerania	2,115	498	23·54	1,686	54	3·20	56	54	44,187	713	1·61
Posen	4,778	1,245	26·05	2,587	229	8·85	33	26	34,004	992	2·91
Brandenburg ..	2,919	303	10·38	3,371	51	1·51	38	45	44,059	752	1·70
Silesia	6,821	734	10·76	5,591	265	4·73	17	24	99,537	1,426	1·43
Saxony	5,478	1,209	22·07	5,972	1,191	19·60	27	28	50,953	8,080	15·85
Westphalia ..	2,962	432	14·58	3,257	459	14·09	35	32	49,452	5,570	11·26
Total ..	36,991	5,040	13·62	26,759	2,298	8·58	34	34	421,953	19,407	4·59

An interpretation of the meaning of this Table is not easy. Its chief defect is the absence of any statistics of the number of peasant farms (and of the quantity of land remaining to them) from which the newly arisen farms by sub-division on inheritance had sprung. It is impossible therefore to estimate directly the character of sub-division; but it may be assumed that the sub-division is not the equal and total, or equal and nearly total, sub-division of the French law. It is curious to note that, in the provinces of Saxony and Westphalia, where for a long time past free trade in land has been most developed, the sub-division by inheritance is greatest, whereas in the province of Prussia it is least. The Province of Posen follows Westphalia very closely, but the causes there are probably different. By a comparison of the average size of the new team-requiring farms, which have arisen from sub-division by inheritance with the average size of such peasant farms in 1859, another curious fact presents itself. That average size is in Saxony and Westphalia less than one-half of the average size of such farms in the province, whereas in other provinces the proportion ranges from three-fifths to two-thirds. For the whole seven provinces, that average size scarcely exceeds one-half of the average size of a peasant farm. It is also curious to notice that in Westphalia and Saxony the number of broken up team-requiring farms equals the number of new farms In Posen, alike in the sub-division by inheritance, there is on the other hand a clear gain of a thousand new farms or 20 per cent. Indeed, Posen seems to be altogether exceptional. The chief reason for this exceptional position seems to be that equal sub-division is by no means the custom, and that although it is the custom to favour the eldest son, it is also usual to give one or more other children shares more or less in excess of their obligatory shares, and it may also be that the smaller farmer prefers to leave the farm to one child, with or without charges for the others as may be necessary. This preference may not have so much weight in countries within the domain of French law. As regards Saxony and Westphalia, the conclusion seems to be that in respect of numbers there is neither gain nor loss, but in respect of average size a decided loss in consequence of sub-division on inheritance. It is true that that average size is about the same as the average size of the newly arisen farms. But under the conditions of the statistics hereinbefore given, the obvious inference is, that sub-division on inheritance has, in spite of accretions by extinction of commons or by compensation or by economy, reduced the average size of peasant farms subjected to it to half the average size of such farms in general. It may be that further information would qualify this inference for it is impossible, that only the smaller farms have been subject to sub-division on inheritance, and that they have maintained their former average size. It must always be borne in mind that these peasant farms have during this century been acquiring land by extraneous causes, such as the extinction of commons, Therefore either the sub-division, being spread over all sizes of

farms, has been such as not only to counteract the effects of such extraneous causes but also to reduce the average size of the farm by one-half, or being confined to the smaller farms, it has nearly balanced the effect of such extraneous causes. It will be recollected that in spite of such extraneous causes of increase, the average size of the peasant farm was in 1859 the same as in 1816.

Under these observations has lain the assumption that the sub-division was equal, or nearly equal. If, however, it were very unequal, *i.e.*, if the newly-arisen farms bear a very unequal ratio in acreage to the farms from which they had been separated by sub-division on inheritance, then the average size of such inherited farms cannot be held to indicate a diminution of the usual average size of peasant farms by sub-division on inheritance.

bsorption of am farms.

176. Another point of interest is to ascertain the influence of absorption by small holdings and by privileged holdings upon the team-requiring peasant farms. The known statisties on this point are in the following Tables:—

RESULTS of Absorption.

	Team Farms broken up by Absorption.				Together.

Saxony	20,276	0·79	48,074	17,107	30,967	1·20	503	?
Westphalia	14,083	0·58	31,132	9,360	21,772	0·89	231	..
Total	312,443	1·36	675,938	208,024	467,714	2·04	9,599	2,558

From these Tables it appears that of the loss to team-requiring peasant farms of 1,331,691 acres or 5·23 per cent., 468,712 acres or 2·04 per cent., *i.e.*, about three-eighths,

were absorbed by privileged holdings; 862,979 acres or 3·75 per cent., *i.e.*, about five-eighths, by peasant small holdings. There was a gain in other directions by absorption, which reduced the total loss to a nett loss of 1,198,670 acres. It will also be observed that nearly 19 per cent. of the newly-arisen peasant farms consisted of small holdings, which had by acquisition from peasant farms become team-requiring farms. There is not sufficient time to analyze these figures further, but it may be pointed out that in Pomerania and Silesia the per-centage of total loss has been about 10 per cent.; whereas in Saxony and Westphalia it has scarcely reached ·04 per cent.

Ratios of team farms to small holdings.

177. The ratios between the team-requiring farms and the small holdings vary considerably, according to the province. Thus the small holdings bear to the team-requiring farms a ratio—

In Prussia of	9 to 10
Pomerania	5 to 3
Posen	2 to 3
Brandenburg	5 to 6
Silesia	3 to 1
Saxony	5 to 2
Westphalia	8 to 3
And in these seven Provinces of	3 to 2

It is interesting to observe that the proportion of small holdings to peasant farms is highest in such provinces, as Saxony where the changing lands have so long existed; and as Westphalia where the freedom of exchange in land was earlier introduced; and as Silesia where an improved legislation obtained at an earlier date. There is, however, reason to believe that in the latter the proportion of small holdings was formerly higher.

Dismemberment in New Pomerani and Rügen.

178. It will be remembered that in the course of this Report it has been frequently necessary to separate New Pomerania and Rügen (the provincial district of Stralsund) from the rest of the eastern provinces as a portion in which, owing to Swedish law, the agricultural legislation had a different development. This has also been done in the statistics of the 1859 inquiry, chiefly because there were so many leaseholders in that district. The figures include owners and tenants. Of team-requiring peasant farms there were:—

	Number.	Acres.
In 1816	1,583	154,308
1859	1,494	145,660
Decrease	89	8,748
	Or, 5·62 per cent.	Or, 5·66 per cent.

Thus the tenant-farms are not exempt from the same decrease as proprietary farms. This net decrease in acres was thus distributed:—

	Acres.
From regulation and separation	1,592
Absorption by small holdings	3,572
Absorption by non-peasant holdings	3,584
Total	8,748

The nett decrease in numbers is thus found:—

The total decrease by absorption was	203
„ by dismemberment was	78
	281
The total increase by various causes	192
Net decrease	89

In 1859 there were also 5,369 small holdings, with 19,224 acres. It will be observed that the average size of team-requiring farms is scarcely 10 acres, and of small holdings scarcely 4 acres.

No great sub-division.

179. It is much to be regretted that the inquiry of 1859 was not extended to the Rhine Provinces. But so far as it went the general conclusion to which it points is, that the dismemberment legislation has caused no great and minute sub-division of the land and that the smaller proprietors have in the forty years by no means injuriously gained ground. For in 1859 of the total area of the seven provinces 59·73 per cent. was in the possession of non-peasant holders and in large properties, 35·10 per cent. in team-requiring peasant farms, and 5·07 per cent. in small holdings. But in the first per-centage is included about 15 per cent. for State and mortmain and municipal property, so that about 44·73 per cent.

only are in private hands. If this fact be taken into account, then the aggregate acreage of peasant properties is about equal to that of the large properties. But there were fears not only as to the danger of excessive sub-division from small proprietorship, but also as to the danger of the gradual diminution of the middle properties—the team-requiring peasant farms. The statistics on the contrary show that the diminution is only 5·11 per cent. in forty years, which, if the doubling of the population in the same period be considered, is in Prussia looked upon as small, and as at any rate unexpectedly small.

ss to small oldings.

180. With regard to the small peasant holdings, there are two ways of looking at them in connection with this dismemberment legislation. If their former possessors be considered as owners with limited rights, then it is probable that the number in 1859 is less than in 1816. But if their former possessors are considered as mere tenants either at will or for a terminable period, then it is more correct to look upon such small holdings as recently created. In this latter view it is not correct to refer to the disappearance, under the influence of the Declaration of 1816, of such small peasant holdings as a loss to peasant proprietorship. But it certainly seems more accurate to look upon the small peasant holdings in 1816 as property, however imperfect, and to look upon the subsequent change as a conversion of imperfect proprietorship into absolute ownership. And it is considered that the references in this report to their nature and the bearing of legislation upon them will support this view. It is, therefore, very regrettable that it is impossible to compare their position in 1859 with their position in 1816. But if it be assumed that the figures obtained in the inquiries of 1838 and 1852 are sufficiently accurate for purposes of comparison in respect of the small holdings, then the following Tables can be constructed :—

NUMBER of Non-team-requiring Peasant Properties.

Provinces.	1837.	1851.	1859.
	No.	No.	No.
Prussia	47,313	70,439	74,628
Posen	27,950	38,809	34,084
Pomerania	19,610	28,112	30,258
Brandenburg	44,721	57,728	61,556
Silesia	151,486	164,707	207,275
Saxony	74,907	87,418	101,151
Westphalia	93,358	108,891	95,569
Total	459,345	556,104	604,501

Provincial Districts.	Average size.		Smallest size, 1851.	Largest size, 1851.
	1837.	1851.		
	Acres.	Acres.	Sq. yards.	Acres.
Königsberg	4·0	4·1	51	4·4
Gumbinnen . ..	3·7	3·9	34	2·4
Dantzig	4·1	4·0	68	10·1
Marienwerder ..	5·5	4·8	34	13·4
Posen	9·5	8·6	68	3·2
Bromberg	6·2	6·0	17	5·4
Stettin	6·0	7·0	85	7·9
Köslin	6·2	8·4	170	12·8
Potsdam	3·2	3·8	84	10·8
Frankfort ..	4·5	4·6	17	10·1
Breslau	4·0	4·7	34	10·3
Oppeln	5·5	5·8	34	4·9
Liegnitz	2·9	2·7	17	20·7
Magdeburg	3·0	3·3	34	1·9
Merseburg	7·5	7·0	34	8·6
Erfurt	4·1	4·0	93	3·3
Münster	9·4	9·8	51	12·7
Minden	8·6	8·0	51	19·2
Arnsberg	10·5	9·4	17	28·3
In the seven Provinces	5·8	5·9	17	28·3

If then these figures are to be trusted there was in the period from 1837 to 1851 an increase of 30 to 50 per cent. in the number of small holdings in each province, but in 1859 the numbers in Posen and Westphalia diminished, whereas there was a relatively similar increase in the other provinces. If the average size be regarded, it will be found that it became larger in 1857 except in a few provincial districts, and that throughout the State the average size was about the same in 1837 and in 1851. The alterations were never important. The variety in the sizes of the smallest and largset holding of this kind ineach provincial district is great.

Dismemberment split up from 1837 to 1851 42,723 small holdings of 157,048 acres, which were thus distributed:—

3,792	acres to increasing	278	privileged estates.
3,022	„ to founding	609	new team peasant farms.
30,380	„ to increasing	8,028	team peasant farms.
60,306	„ to founding	20,958	new small holdings.
58,980	„ to increasing	23,392	small holdings.
588	„ to other purposes		
157,048			

But the small holdings similarly gained as many as 650,610 acres from privileged holdings and from team peasant farms.

181. There are also some other statistics bearing upon this subject. For instance, in the five years 1852-56 there were 65,425 plans of apportionment of charges to portions of lands separated from estates. In the same period 5,764 farms, sufficiently remunerative for independence, disappeared from splitting up, and 10,225 by absorption into other properties.

In connection with this dismemberment legislation it will be of interest to quote here from a subsequent section of this part of the Report its indirect result in causing estates to be sold by compulsory auction. Of a total number of 12,433 landed properties thus sold for reasons of debt, or of sub-division from 1858 to 1867 in four departments, 1,190 were sold, because sub-division was necessary. Of these 343 were peasant properties, and 7 were privileged properties, the rest being town properties.

Latest notices of results of dismemberment.

182. The agricultural Report from West Prussia, as quoted in the Official Year Book for 1868, notes, "that the peasant farms of 60 to 150 acres in many departments have been bought up chiefly by partnerships with Jewish capital, and sub-divided into small portions. This has not, however, passed due bounds, but has tended to increase the number of settled labourers, who in consequence of the smallness of their holdings are obliged to seek further means of livelihood upon larger estates at harvest time and by labour in subsoil draining, &c." From Posen no important change in the distribution of land is reported. "The so-called slaughter of peasant property is recently less. The holding fast to the inherited property is fortunately becoming more and more a characteristic of the peasants of this province." In Brandenburg "the dismemberment, especially of peasant properties, and more seldom of privileged properties, takes place more or less throughout the province. It is caused less by real interests of agriculture than by the speculations of the so-called estate-slaughterers. One result, however, is that other peasant properties increase by buying portions of the sub-divided properties." In Pomerania "the peasant properties are subject to much splitting up by sale or on inheritance." In Silesia, "the sub-division progresses without raising fears." From Westphalia it is reported, "the land is much split up in the provincial district of Minden." Such are the references in the official Reports to the results down to 1868 of this dismemberment legislation.

(δ.)—*Results of the Legislation of Special Procedure.*

183. These results are so intertwined with the other branches of the legislation, and are so obvious that they need not be here recapitulated. But it will be of some interest, and will complete the statistics of the work as given in the previous sections to append the following figures of the affairs now pending before the special procedure authorities. For the year 1868 there remained at the end of 1867, 6,107 cases, of which a third had nearly reached the last stage. In the year 1867, five new cases of regulation, 616 of commutation, and 4,414 of commons had come before them; and it is understood that, so far as regards the old provinces and exclusive of the recently acquired provinces, the new cases were fewer last year, and have been this year fewer and of less importance.

(ε.)—*Results of the Legislation for Land Improvements.*

184. In this section an attempt will be made to sketch the more or less direct results of the legislation delineated in the corresponding section of the preceding part of this Report. No attempt will therefore be made to estimate the influence upon agricultural progress of the improvement of means of communication in railways, roads, and waterways. The development of such means of communication belongs rather to the following part of this Report.

The system of land improvements has certainly obtained by recent legislation such a stand-point that it cannot fail to have a most important future. Associations which have been formed under its influence have in rich districts found their entire capital without

State loans by aid of the debentures to bearer, and have only resorted to State advances either in order to begin work at once or in order to meet some unforeseen expenditure. But in poorer districts associations have often had to obtain a half or more of their capital by State loans.

Extent of works of land improvement.

In the last twenty years the undertakings for land improvements have embraced 1,951,280 acres, about 2·7 per cent. of the entire area of the kingdom. Of that acreage dykes, at a cost of 1,506,081*l.*, have protected by new or improved works 1,240,960 acres, and irrigation and drainage works have improved at a cost of 885,951*l.* the remaining 710,320 acres. To the accomplishment of this work the State has granted only 266,011*l.* and advanced only 233,304*l.* Private enterprize has therefore found five-sixths, and the State only one-sixth of the capital. To put this in other words, out of every 24*s.* 6*d.* per acre which the works cost, the State found only 2*s.* 6*d.* The similar points of such undertakings in England and France have been compared unfavourably with the above points. For instance, works in Ireland costing the State 62 per cent. of the total capital have been thus quoted, but I am not able from want of acquaintance with such matters to institute any comparison. Yet, even after every allowance for difference in difficulties to be overcome and in labour to be paid, the probability is that Prussia has done her modern work of land improvement more cheaply than we have.

185. The number of dyke associations is 94, the number of compulsory irrigation and drainage associations is 95, and the number of voluntary irrigation and drainage associations is 170. In these numbers are included no old associations except those whose statutes have been revised according to the new law. Besides these there are some 400 meadow associations in Siegen, partly in existence before the law of October 28, 1846, and partly established since 1846. These latter embrace an area of 13,502 acres. The area, to which the benefit of an association for land improvement extends, varies much. For instance, there are 98 voluntary associations for irrigation, &c., in the Rhine Provinces with 4,528 acres only, whereas in Brandenburg there are 4 such associations with 15,378 acres. Also there are in Pomerania 8 such compulsory associations with 3,848 acres only, whereas in Saxony there are 8 with 166,242 acres. The dyke associations also naturally vary much as to the extent of country they protect. It may be further noted that Saxony, Brandenburg, and the Rhine Provinces have availed themselves of this legislation to the extent of about a twentieth of their area, and that the other provinces, with Westphalia last, follow in diminishing ratio.

To the total capital of all the undertakings the following are the proportions raised in different ways:—

17·4 per cent. by State advances and loans.
28·1 „ by debentures to bearer.
29·4 „ by private loans.
25·1 „ by private subscriptions.

The following Table will show the various points in connection with all these kinds of associations:

	Dyke Associations.	Reclaiming and Irrigating Associations (Compulsory).	Reclaiming and Irrigating Associations (Voluntary).	Total.
	No.	No.	No.	No.
Associations	94	95	170	359
	Acres.	Acres.	Acres.	Acres.
Improvement area	1,240,960	646,134	64,188	1,951,282
	£	£	£	£
Capital	1,506,079	818,987	66,819	2,391,885
Capital obtained—				
From State	164,378	224,690	24,960	414,028
By debentures to bearer	372,255	229,272	..	671,527
By private loans	505,104	183,343	12,746	701,193
Capital paid off to December 1866—				
Of State advances	41,156	10,752	5,285	57,193
Of debentures to bearer	23,996	16,783	..	40,779
Of private loans	153,688	89,854	7,044	250,586
Capital owing in 1867—				
To the State	123,222	213,927	1,967	339,117
By debentures to bearer	348,259	282,489	..	630,748
By private loans	351,416	93,489	5,702	450.607

Forest planting.

186. Then, too, the forest planting on the Eifel must be noticed. Its object has been to render the unproductive moor, mountain sides, and high plateaux productive by suitable plantations, and to protect the plains by uniting existing forests. The plans were made

on the spot with every possible regard to the agricultural and financial relations of the commune. The labour was furnished by the communes themselves, and only a premium either partly or approximately related to the actual outlay was given by the State. But the cost of the preliminary inquiries and surveys, of the special implements and of the supervision of the cultivation was borne by the State. From 1855 to 1866, at an expense of 17,833*l.*, about 29,174 acres have been planted. This average forms part of 83,334 acres already marked out for replanting with woods. In the Northern Provinces where such undertakings have a larger field, the State has hitherto rendered these services to agriculture at its own cost by planting the sandhills of the coast and other bare and unproductive districts.

Improvements yet to be made.

187. The dyking of rivers and streams is nearly finished. But there are still important works at the Memel Delta on the Vistula and on the Elbe to be accomplished. The reclaiming of land has still a large field for its operation. The increase of population and the hitherto rising value of land will stimulate such undertakings. There seems to be still much damage caused by mill-dams, and by the vagaries of private streams, and there seem to be still large tracts of swampy land. Numerous undertakings for removing these evils are, however, even now in process of establishment. On the other hand, the action of the Irrigation Law is not so extended.

As to the effect of land improvements upon the value of land it is impossible to estimate it in figures. But it has certainly varied very much. Under favourable conditions the effect has been to increase the value three or even ten times within a few years, whereas under less favourable conditions it has required the labour of ten years to obtain a remunerative return.

Finally, it may be recorded that as yet no large Association has failed in its undertaking, and only a few Irrigation Associations in the hilly districts of the Rhine have been from want of sufficient water unsuccessful. The self-administration of dykes and other works by the associations has answered admirably.

Latest notices of land improvements.

188. It must be conceded that this is but a hasty glance at the land improvements in Prussia, but it would demand more time than can now be given to appreciate their importance by a more complete investigation. A reference must, however, be made to the notices on land improvements in the "Official Agricultural Year Book for 1868." The bringing into tilth of forest clearings and the improvement of barren lands have been actively pursued, chiefly in the less cultivated provinces. In Westphalia, however, the yearly increase of 1,500 to 2,250 acres of moorland brought into cultivation has continued. In the Rhine Province, too, the cultivation of barren lands, chiefly in the provincial district of Trèves, receives much attention. In regard to Drainage and Reclaiming Associations the year 1867, with its abnormal weather, has given them an impetus. The famine in Prussia caused a grant of 15,000*l.* to be spent in employing destitute persons on land improvements, and respecting this attempt to relieve the distress of the people an interesting special Report has been published. The various improvements in Prussia affect 25,000 acres, at an expenditure of about 70*s.* per acre, of which the State has advanced 36*s.* In Posen several important works have been brought to a successful conclusion or are in process of establishment. A large undertaking affecting nearly 100,000 acres in the Provinces of Saxony and Hanover and the Duchy of Brunswick has been practically finished. A similarly large undertaking for improving the course of the Aller and Ohra is being vigorously pushed forward. There are notices of works in the other provinces. Altogether there were in 1858, 57 undertakings affecting 449,290 acres in progress, and 106 affecting 1,247,654 acres in preparation. Besides these, works of subsoil draining have been extended. As regards Associations formed under the Dyke, Reclaiming of Land, and Irrigation Laws, it appears that in 1868 had arisen—

	Acres.	Capital.
		£
4 dyke associations, with	22,184	53,467
22 compulsory associations, with	41,498	32,275
32 voluntary associations	15,392	11,928
Total	79,074	96,672

Of the 22 voluntary Irrigation and Reclaiming Associations 17 belong to the Rhine Provinces, 5 to Westphalia, and the remaining 10 to the rest of the Kingdom. Of the 22 compulsory Irrigation and Reclaiming Associations 6 belong to the Rhine Provinces and Westphalia, and the remaining 16 to the rest of the Kingdom. Of the 4 Dyke Associations the 2 of importance belong to Saxony.

(ζ.)—*Results of the Auxiliary Agricultural Legislation.*

Land tax.

189. The important subject of the land tax claims the first notice. It will be recollected that the object of the new legislation on the land tax was to equalize its incidence throughout the country and to render the ratio of taxation imposed by it upon the holders of land more nearly correspondent to the ratio of taxation imposed upon holders of other kinds of property. Dr. Engel, President of the Statistical Bureau, published the year before last an elaborate and interesting investigation of the question, to what extent land is really taxed by the land tax? After a detailed examination of the various conditions of the problem be arrived at the conclusion that the incidence of the taxation was not uniform, for its rate varied from 2 groschen to $7\frac{1}{2}$ groschen per morgen, or from $3\frac{1}{3}$ per cent. to $5\frac{9}{10}$ per cent. of the net returns. At the same time the results of his investigation showed that the complaints were unfounded as to its rate of incidence reaching nearly 10 per cent. on tilled lands in some parts of the monarchy. It may be remarked that the higher rates are borne by Silesia, Saxony, Westphalia, and the Rhine Provinces. The brief summary of Dr. Engel's conclusions is added on account of its interest:—

"1. The area of fallow is 18 per cent. of the total area of arable land.

"2. The average gross returns of all kinds of cultivation of arable land is 500 groschens per morgen.

"3. The average cost of production absorbs 80 per cent. or 400 groschen.

"4. The average net returns are, therefore, 100 groschen.

"5. The average land tax is 4·21 groschen.

"6. Accordingly the average ratio of incidence is 4·21 per cent."

Agricultural acadamies.

190. The important subject of instruction in agricultural knowledge claims the next notice. There are now only four of the higher class of technical institutions—called "agricultural academies"—viz., at Eldena, Proskau, Poppelsdorf, near Bonn, and at Berlin. Agriculture is also taught at Halle. These institutions were frequented from 1865 to 1868 by an average number of 235 students per term. In the last term of last year there were out of 275 students 47 foreign and 26 German, but not Prussian students. The course of instruction in these institutions will be briefly noticed in the subsequent part of this Report. There are now twenty-six middle and lower agricultural schools, attended by about 120 free scholars, 29 partially boarded, and 173 entirely boarded scholars, making a total of 321 scholars. The total number of scholars educated by these schools is 5,223, of whom 1,117 were not Prussian. These schools have an area of 13,459 acres under cultivation for the practical instruction of their pupils. The State aid amounts to the annual sum of 5,280*l.* Some further details not so directly connected with the action of the State will be found in the subsequent part of this Report. The model farms have, in spite of all State subsidies one after the other disappeared, and require no further reference. On the other hand, the instituting of practical experiments in scientific agriculture has been developed.

Agricultural associations.

191. This section cannot be closed without a reference to the numerous agricultural associations which have been founded for the promotion of agriculture. At the end of 1868 there were—

Central associations	31
Branch ditto	618
Independent ditto	170
In all	819

These associations had—

Free members	4,810
Subscribing ditto	105,186
Members in all	109,986

They possess libraries, agricultural collections, implements, &c., and also a money capital of over 50,000*l.* Their total income exceeds 40,000*l.* These associations are mentioned here, although they are voluntary societies, and have not been directly called into existence by the laws of the State, because they serve to complete this brief summary of the results of auxiliary agricultural legislation, inasmuch as they owe their present importance to the indirect influence of the State and are of essential advantage to agriculture.

192. The subsidies to provincial loan funds mentioned in the corresponding section of the previous division, seem to have formed the commencement of the institutions of such loan funds in every province. But I am not in possession of any further information in respect of their influence upon the agricultural development of the country.

(*b.*)—*Results of the Laws and Institutions limiting the power of Disposal of Land.*

193. For the most part these results are stated in stating the directions of the law. If the law forbid alienation the result is inalienability; if the law compel succession in accordance with the will of a donor or founder, that succession limits the right to dispose of land. But it will be interesting to state the facts as well as the laws. To what extent do the institutions referred to in the corresponding subdivision of this report limit free exchange in land?

The following Table will give the answer:—

	Acres.	Per cent.* of Productive Acres.	Net Returns according to basis of Land Tax.	Proportion per Acre.
			£	*d.*
Royal estates	275,685	·55	48,872	31
Crown lands—				
a. Demesnes	975,000	9·58	329,066	81
b. Forests	5,288,113		464,689	21
c. Other property	315,070		30,411	23

Unproductive area	2,754,430	..	..	..
Total†	71,421,981	100·00	16,332,884	56

194. As regards the Crown estates of the Royal Family they are very small. The Prussian Sovereigns acquiesced at a very early date in the separation of the so-called State demesnes or Crown lands from the Crown. In 1820 the Civil List ("Krondotation") was fixed at 375,000*l.* a-year, which was in 1850 raised to 450,000*l.*, and has since January, 1868, been raised to 600,000*l.* "The Constitution" recommended that the Civil List should be a first charge upon the Crown lands, in return for which it is granted or out of which it sprang; but this does not appear to have been yet done. Crown estates of Royal Family.

As regards the Crown lands it will be noticed that the forests are extensive. The Crown lands do not, however, reach to one-tenth of the aggregate of land in the kingdom. The national property, such as woods, public rivers and waters, &c., are not included. The Crown lands were in 1820 erected into security for the national debt, and all monies received on account of them must be applied to the sinking fund of that debt; for this purpose powers of sale as well as powers of regulation of property relations have been granted. The alienability of the Crown lands is not expressly forbidden, and indeed during the last fifty years many Crown estates have been sold in carrying out the regulation of property relations. Crown lands.

As regards corporations they do not possess one-twentieth of the aggregate of land in the kingdom; the churches and parsonages possess a sixty-fifth part, and the schools only a hundred and seventieth part.

195. As regards fiefs and estates in *fidei commissa* it will be interesting to give a Table showing their distribution by provinces. Fiefs and *fidei commissa*.

* This is the proportion to the whole productive area of the Monarchy.

† This total is exclusive of the lakes on the shores, which have an area of more than 1,000,000 acres.

	Area.	Proportion of Productive Area.	Net Returns.	Proportion per Acre.
	Acres.	Per cent.	£	*d.*
Prussia	268,150	1·70	45,812	41
Pomerania	1,150,015	15·10	199,798	42
Posen ..	122,903	1·68	18,353	36
Brandenburg . ..	841,088	8·41	153,522	44
Silesia	1,112,109	11·00	185,654	40
Saxony	495,264	7·93	183,085	88
Westphalia . ..	342,696	6·80	93,448	65
Rhine Provinces ..	99,898	1·50	33,321	81
State	4,432,123	6·45	913,293	50

Their ratio in area to the aggregate of land is highest in Pomerania and lowest in the Rhine Province. It is curious to note how the original settlement of the land, the outward arrangement of landed estates, the development of the feudal system, the different systems of law, the influence of race, and the influence of foreign action, can all be traced in the results embodied by these figures in the different provinces. Taking area and net returns together these estates are most flourishing in Saxony and least flourishing in Posen and Prussia. It will be observed that this total area is scarcely a seventeenth part of the aggregate area of the kingdom. The proportion of settled and entailed property would doubtless be much larger in England. It has been impossible to get any statistics showing how much land was held on entail by eldest sons or youngest sons, or by oldest of the same degree, or by oldest of the family. To the latter form of succession a few entails are still subject. It is seldom that a *fidei commissum* is now founded.

196. The total of all the lands over which there exists only limited rights of disposal is 15,649,995 acres, being rather more than one-fifth of the aggregate of land in the kingdom.

The Crown lands are most extensive in Prussia and Brandenburg, least in Westphalia. The corporation of towns have the most land in Brandenburg and the least in Posen. The corporations of communes hold a sixth of the land in the Rhine Provinces, but only a four hundredth part in Prussia. The churches and parsonages are more equally endowed province by province, but never hold more than a fortieth part of the land. The religious and charitable institutions are best endowed in Pomeranina and Brandenburg, but have only in each province about a hundred and twenty-fifth part of the land.

Indefeasible heritages.

197. The foregoing account of the accompanying facts of the laws restricting the power of disposal over land will give an idea of how far they limit the free exchange in land which constitutes the rule in the provisions of the legislation. A few words must be added on the influence of indefeasible heritages, an influence which is exerted in favour of free exchange in land, although the law constitutes practically a limitation also of the powers of disposal over land. It is clear that this doctrine does, so far as it goes, produce the effect of the French laws of succession, or, in other words, it has the effect of a compulsory intestate succession to a varying portion of the estate of a deceased person. It does not necessarily divide the land, but if there be no other property of the deceased to satisfy the claim for the obligatory shares, the land or the value of the land he leaves must be divided in such a manner as to satisfy those claims, except in the case of lands in *fideï commissa,* or held as fiefs, or held by any other kind of recognized entail which are not subject to this law. The tendency is therefore to break up landed properties; and this law is always acting, for it is, subject to the above mentioned limitation, universally compulsory at the will of the natural heirs, and in this respect, therefore, it has more influence than the laws of intestate succession, from the action of which a man can withdraw his property by availing himself of his power to make a will. This law of indefeasible heritages may have had some influence in producing the compulsory sales by auction noticed in the γ section of the *e* subdivision of this division, and the results of dismemberment legislation noticed in the γ section of the *a* subdivision of this division of the Report; but it is impossible to ascertain the amount of influence upon them, or indeed to give by statistics any account of the results of this law in favour of children's rights, which is unknown to our legal system.

(*c.*)—*Results of the Laws of Intestate Succession.*

198. There are no statistics forthcoming to show to what extent the laws of intestate succession receive application. When they are applied, the result is division of all property including land and frequently equal division. I am informed that it is the custom for every one, who has any property to leave, to make a will. It will be remem-

bered that, subject to the claims of indefeasible heritages, the law allows entire freedom in the disposal by will of property. The custom of making wills diminishes, consequently, the effect of the division ordered by the law of intestate succession. In the γ section of the *e* subdivision of this division of the Report will be found some statistics of the number of properties compulsorily sold at auction for reasons of division on inheritance, but there is no indication to be obtained from them as to whether those sales were caused by the effect of a will or by the influence of the law of indefeasible heritages, or in consequence of the law of intestate succession. Neither can it be traced how far the results of the dismemberment legislation, as displayed in the γ section of the *a* subdivision of this division of this Report, may have been influenced by the laws of intestate succession.

(*d.*)—*Results of Law of Landlord and Tenant.*

199. This part of the law of the land cannot be said to have direct results in the sense of having had direct influence in creating tenants as the agricultural legislation has had in creating peasant absolute proprietors. But it has this accompanying negative fact, that its provisions are seldom required. For showing this fact the returns of the census of 1861 are at present the latest which can be used, and the statistics hereinafter quoted will be based upon those returns.

Tenants in Pomerania.

It has already been noticed that, in New Pomerania, the Swedish law had almost annihilated the peasant proprietors. It is not, therefore, surprising that there tenants have been numerous. Indeed, so numerous were they, that whole villages consisted of leaseholders of the farms of landed proprietors. In Rügen one half of the team-requiring peasant farms are held on lease. In older times the tenants on the lands belonging to the town of Greifswald used to hold them on leases of 24, 50, and even 60 years in common by villages, but in modern times each peasant has had a separate lease. On the renewal of such leases the number of tenants was sometimes increased and sometimes diminished, and often a number of tenant farms was absorbed into the outlying farms of the landed proprietor. Here, too, there were found some real services between lessor and lessee, which had to be commuted. This system of leasing has continued to exist in Pomerania, as has been already seen in the 178th paragraph of this part of the Report.

In 1861 there were in Pomerania 6,308 tenants to 62,374 proprietors, about one-eleventh of all the farmers, but of these there were in the provincial district of Stralsund 2,115 tenants and 4,457 proprietors, the tenants therefore amounting to nearly one-half of the number of proprietors, and forming nearly one-third of the total number of farmers In this provincial district are the departments of Greifswald and Rügen, containing about one-third of the population of the provincial district. The proportion of tenants in them exceeds the half obtaining in the said district. These figures include farmers, properly so called, to whom farming is the sole or chief business, and also cultivators to whom farming or rather cultivation is only subsidiary. If the former category be alone considered, the proportion of tenants is still more exceptional to the rule throughout the kingdom. Of farmers, properly so-called, there are in this provincial district 1,170 tenants and 1,483 proprietors, the tenants therefore forming nearly one-half of the total number of farmers. Of such farmers there are in the department of Rügen 493 tenants and only 359 proprietors, and in Greifswald 201 tenants and only 197 proprietors, the tenants in both cases exceeding the proprietors. These figures further include the tenants on Crown lands, which form about a fifteenth of the whole area in those departments; and if a separation were effected it would lessen the proportion of tenants to proprietors on lands, which could be farmed by proprietors instead of tenants, for Crown lands cannot be of course farmed by proprietors. This observation is equally applicable to all subsequent statistics on this subject, but needs no repetition on each occasion.

Length of lease.

It must not be forgotten that the Crown agricultural leases are 12, 18, 24 years. There is no special information as to terms of years in other leases. But it may be considered that the rule is to grant long leases. In Posen, however, short leases occur—even leases of only three years. This system of three-year leases arises out of the system of three-field cultivation or three-year rotation of crops. It will, however, have been remarked that the tendency of the law of landlord and tenant is to give a tenant by silent prolongation of his lease the right to remain until the rotation of crops by local custom has been completed. Hence as the period of rotation increases, so will the minimum period of the tacit prolongation and also of the leases increase.

Tenants in Westphalia;

It has also been mentioned in this Report that a system of leases existed in ancient times in Westphalia. This system has not died out in that Province. The proportion of tenants to proprietors amongst farmers is, however, much less than in New Pomerania. There are 15,315 tenants to 103,807 proprietors—about one-eighth of the total of

farmers. Of these tenants 7,314 are farmers, properly so-called, and 8,004 are cultivators with another industry. In the Department of Münster are 10,379 of the total number of tenants, and they are nearly one-fourth of the total number of farmers.

And in Rhine Provinces.

It has also been previously remarked that the system of letting land on agricultural leases had existed in the Rhine Provinces. But tenants are not a considerable proportion of the farmers. In this Province "farmers" must be taken to include all persons independently engaged in any branch of agriculture, for the culture of the vine is an important branch of agricultural industry in that Province. There are 15,004 tenants to 237,397 proprietors—forming about one-sixteenth of the total number of farmers. But in the Department of Dusseldorf there are 7,375 tenants (or nearly a half of the whole) to 42,516 proprietors—forming as much as one-seventh of the total number of farmers.

Tenants in the Kingdom.

200. The following Table will give these figures and also the corresponding ones for the other Provinces :—

Provinces.	Farmers and Farming Large Owners.		Cultivators, with another Industry as Chief Employment.		Total of Proprietors.	Total of Tenants.
	Proprietors.	Tenants.	Proprietors.	Tenants.		
					No.	No.
Prussia	117,873	3,807	43,597	2,644	161,470	6,451
Pomerania . ..	39,962	3,762	22,412	2,546	62,374	6,308
Posen	66,932	1,384	13,755	722	80,687	2,106
Brandenburg ..	74,090	1,533	38,910	2,683	113,000	4,216
Silesia	165,013	3,167	71,575	4,520	236,588	7,687
Saxony	65,363	1,193	50,431	2,456	115,794	3,649
Westphalia . ..	62,387	7,314	41,420	8,004	103,807	15,318
Rhine Province ..	161,677	8,134	75,720	6,870	237,397	15,004
State	753,297	30,294	357,820	30,045	1,111,117	60,739

From this Table it will be seen that throughout the whole kingdom, as it existed before 1866, there are only 60,739 tenants (including Crown tenants) to 1,111,117 proprietors—the tenants being therefore about one-twentieth of the total number of farmers. Of these 60,739 tenants one-half are farmers properly so-called, and one-half are cultivators with another industry. Again, of these 60,739 tenants about one-half are in Westphalia and the Rhine Province, about one-quarter in Pomerania and Silesia, and the remaining quarter in the other four Provinces. The proportion of Crown tenants I do not know, but the number of demesnes is about 500.

Relative importance of tenants.

201. In judging of the relative importance of proprietors and tenants as farmers, the number of cultivators having another industry as their chief business can be fairly disregarded, for they are merely cultivators, usually of very small plots of land, for the purpose of providing themselves with potatoes and other vegetables; they are very seldom farmers, or even kitchen gardeners. Then, again, after deduction of the Crown tenants from the farming tenants, another deduction for the tenants on the lands of a tenant for life, of corporations, of commune, and of mortmain should be made. The probability is that nearly all the farming tenants (except, perhaps, a part of those in New Pomerania and the Western Provinces) are to be found on lands which are, for the time, at any rate, practically inalienable, and cannot therefore be sold by the possessors to the farmer. If this be so, or even if a half of the farming tenants be solely on such lands, their importance in the economy of the State is materially reduced, even from the small importance which their numbers had before analysis appeared to give to them. As the desire for land is so great that cultivators are said to prefer buying at even 50 years' purchase, the existence of farming tenants instead of farming proprietors only on lands where the legal relations of the land compel their existence could have been *à priori* assumed, and their existence elsewhere could have been considered as still more exceptional. It would not, therefore, be surprising to find that leases yield a small return only. On the other hand, however, it is stated that the competition for Crown leases (which have hitherto been at a very low rent) has raised the rent. It is also said that in isolated cases a large landed proprietor finds it more advantageous to let his land to farming tenants than to follow the traditional custom of farming it himself, either directly or indirectly by a bailiff. Instances have been mentioned in which one landed proprietor, who adhered to the custom of farming his extensive lands, was contented with a very poor return per acre, whereas a neighbouring landed proprietor had, by letting his lands on lease, obtained a relatively better income at less anxiety to himself. This granting of agricultural leases is, however, usual only under two antecedent conditions, that the landowner has no circulating capital and that the land is in bad condition. Under other conditions the owner farms it himself.

But in Prussia the principle of absolute ownership is too deeply planted, and the desire o owning land is too intense to warrant any expectations of the system of agricultural leases acquiring great importance in the economy of the State; and the custom of farming one's own land, even on the largest estates, is too widespread for the totally different system of cultivation by agricultural leases to gain much ground. Yet, under pressure of poverty on the side of the large landowners, and under pressure of population on the part of the cultivators, such a system may increase, if the landowner refuse to alienate his lands.

Rents.

202. Another point must be briefly noticed. The law recognizes rent in kind, either of a fixed amount or of an amount proportional to the gross produce. There is no information in officially-published statistics as to the extent to which this recognition of the law is requisite. But the general opinion is, that rent in kind of a fixed amount has now become practically rent in money, and that rent in kind of a proportionate amount is seldom stipulated. The record of personal observation in the fifth part of this report will, perhaps, render it possible to form some idea of the existing relative importance of each system. It may, however, be now noted that the custom of letting land on an agricultural lease with complete live and dead stock, but with a fixed rent, was formerly widely spread, and this kind of lease gave the holder a position between that of a bailiff and a tenant in our meaning of those terms. If the rent of such a lease were not fixed, then it became an example of a species of the *métayer* leases. Now, the large landowners farm through bailiffs who have generally full powers; and except as regards outlying farms, or in isolated cases, as above mentioned, they seldom let land on any kind of agricultural lease.

These figures and remarks will show how rarely, in comparison with England or Ireland, the law of landlord and tenant is required. An inquiry into the rents and covenants of agricultural leases will be found in the subsequent parts of this Report.

Eviction.

203. With regard to eviction, there appear to be no collected statistics; but so far as my information goes, eviction is seldom used. It will not, however, be forgotten that even when resorted to, its use is accompanied by various judicial incidents, except apparently in the case of Crown tenants.

Leases on public bidding.

204. This part of the subject cannot be closed without reference to the custom which prevails of granting agricultural leases on public bidding. The Crown, municipalities, and charitable institutions seem to always adopt this plan.

Tenants near Bonn

205. Nor would it be fair to leave unmentioned the fact, according to Dr. Hartstein's work on Bonn in 1850, that in the Bonn District, where the division of land is great, and agricultural tenants are comparatively frequent, the tendency had been to reduce the leases from six or twelve years to three years, leaving the tenant, however, perfect freedom in his agricultural activity. He also writes that the letting in small portions of large estates has become more frequent, inasmuch as, on the one hand, the landowners found that the small cultivator paid a better rent, *cæteris paribus*, than the large farmer, and as, on the other hand, the landowner obtained a better income by thus letting, than by himself farming the lands. He concludes with this remark:—"That, as regards the reproach usually made to small holdings that the gain from them is relatively smaller than from other holdings, it is not applicable to the Bonn district; for the rents of the agricultural leases, and the selling prices of landed property are in it considerably higher than in other neighbourhoods, so that it must be inferred that the lessee or buyer of small holdings can obtain comparatively larger returns from the soil."

(*e.*)—*Results of the Laws of Real Credit.*

206. These results are mainly of a nature not to be embodied in figures and belong also in a great measure to the subsequent portion of this Report. But it will be desirable to give here statistics and other information which is forthcoming for sketching, however imperfectly, the facts which are in direct connection with the laws of real credit

(*a.*)—*Results of the Facilities of Transfer of Land.*

207. Such facilities tend to improve the value of land, but the results of such facilities are not to be measured by figures. It is true that, to a certain degree, facilities of transfer will determine the increased or decreased use of the free exchange in land. If transfer be difficult, the influence of laws promoting free exchange in land will be diminished. But, the existing facilities of transfer having been ascertained, the amount of free exchange in land will be in an indeterminable measure owing to those facilities. The measure of the result is indeterminable, because it is included in the results from the laws promoting free exchange. Accordingly, the results of the laws granting absolute property in land, and of the dismemberment legislation as given in former sections of this Report, and the results of the free exchange, apart from those special causes, must be looked to as containing any

special result from the existing facilities of transfer. On the results of the free exchange it is impossible to offer—at any rate now—much information. The practicability of free exchange is a good thing, but the excessive use of it will become a bad thing. It has for instance, been calculated that in Silesia an aggregate of acres of land, equivalent to the entire property in land, changes hands in a little over twelve years. This calculation is founded upon the observed fact that in 1860—

Sales of land in Silesia.

	No.	Acres.
Privileged estates	3,256	4,398,166
Other large estates	308	191,910
Total estates of both kinds	3,564	4,590,076

were sold; upon the proportion of 5 per cent. in number, and 6 per cent. in acreage which they bear to the total number of such properties, and the total area in Silesia; and upon the exclusion of inalienable lands from the computation. Now this rapid change of ownership has its good side, for it indicates that the large properties were not in the hands of possessors of sufficient capital and that it was necessary they should pass into more monied hands. On the other hand it has its bad side, for it is obviously unfavourable to the best development of agricultural resources. Another rapid change of ownership has been mentioned, viz.: in the Province of Prussia where, within the last thirty or forty years that change has been frequent. It has also been noticed that in that Province scarcely fifty families of the landowners of a hundred years ago remain in possession of their lands. But the ravages of war are to some extent responsible for this fact.

Whatever result facilities of transfer may have had in increaaing the value of land, it is impossible to attempt to estimate it, but so far as it is connected with that increased value it can be judged of from the reference to the value of land in the subsequent part of this Report.

(β.)—*Results of the Mortgage System.*

Estimate of mortgage debt.

208. If one glance before considering the results of the mortgage debenture system at the results of the mortgage system in general, there is practically nothing to meet the view. The results have occurred but they are unrecorded. Dr. Mascher has, however, estimated, without details, the value of the land of landed estates in Prussia at 675,000,000*l.* sterling, and the amount of mortgage debt thereon at from 337,000,000*l.* to 375,000,000*l.*, or about one-half. Of this total, the mortgage debenture institutions find about 21,000,000*l.* and the savings' banks find about 1,500,000*l.*, so that other private lenders find the remainder of from 335,000,000 to 353,000,000*l.* This estimate of the proportion of land debt to land value is probably not excessive, but, on the contrary, moderate. For in 1857 it was ascertained that the proportion of land debt in the provincial districts of—

	Per cent.
Königsberg was	62
Marienwerder	56
Bramberg	68
Köslin	70
Frankfort	63
Oppeln	68

of the estimated value. The land debt is less in Saxony partly from want of facilities, for at that time there were no land credit institutions.

Debts of privileged states.

209. There are also some partial statistics for the years 1837, 1847, and 1857. The following Table contains them :—

MORTGAGE Debt of Privileged Estates in certain Departments.

	Apparent Value.			Mortgage Debt.			Per-centage of Debt.		
	1837.	1847.	1857.	1837.	1847.	1857.	1837.	1847.	1857.
	£	£	£	£	£	£	Per cent.	Per cent.	Per cent.
Neidenburg	50,226	98,051	170,991	32,334	68,982	127,036	64	70	74
Konitz	108,419	178,390	250,542	62,318	124,667	190,442	57	70	76
Coirsitz	264,322	335,673	447,004	220,767	362,533	375,993	84	108	84
Lauenburg	114,275	242,029	319,254	129,825	227,633	284,223	114	94	69
Sternberg	292,688	393,195	474,938	197,900	283,495	246,414	68	72	73
Rybrick	204,443	274,356	397,823	181,608	250,910	337,436	89	90	85

The lands of which the value is given in this Table are privileged lands. It will be observed that the mortgage debt has always increased, and in three departments has increased at a greater ratio than that at which the value has increased. In the province of Saxony also the relations of land debt have become better known, in consequence of the publi-

cation of a memorandum in 1858 by the provincial administration respecting the creation of a new credit institution for landed property. The following Table will give the information in respect of Privileged Estates :—

Provincial District.	Value.	Debt.	Number of Estates.					Total.
			Free from Debt.	To ¼.	To ½.	To ⅔.	To Value.	
	£	£						
Magdeburg	5,559,414	1,395,692	129	64	97	48	18	356
Merseburg	6,930,357	1,429,753	276	58	117	51	35	537
Erfurt	1,820,491	386,930	97	53	49	19	9	227
Total	14,310,262	3,212,375	502	175	263	118	62	1,120

On this Table it may be remarked, that more than a half of the properties are mortgaged, and that about one-sixth are mortgaged to more than one-half of the estimated value. The aggregate result, that the mortgage debts scarcely exceed the fifth part of the value—is more favourable than Dr. Mascher's estimate for the Kingdom. Hence landed property in some parts of the monarchy must be in debt to more than half its aggregate value.

Debt of peasant properties.

There are further some partial statistics in respect of present properties. In the provincial district of Marienwerder in 1860, peasant properties belonging to some 104 localities were mortgaged to the amount of 270,000*l.* and were sold for about 450,000*l.* In five localities the debt was greater than the proceeds; in fourteen it exceeded three-fourths; in forty-one it was from one-half to three-fourths; in thirty it was from one-fourth to one-half; in seven it was less than one-fourth; and in seven there was no debt. In forty-four localities of the district of Mewe, 321 peasant properties were mortgaged for 175,000*l.* and were sold for 275,000*l.* The proportion of debt was as follows :—

Free from debt	53
Mortgaged to ¼	31
Mortgage paid ¼ to ½	66
„ ½ to ¾	62
„ ¾ to all	63
„ to value	46
Total	321

As regards their debts according to size and value, it appears that of these peasant properties the value and debt were as follows :—

In respect of.	Acres.*	Value.	Debt.
		£	£
8 with from	200 to 960	37,000	19,500
36 „	100 to 200	79,000	46,500
50 „	13 to 20	10,500	4,700
35 „	6 to 13	5,500	3,750
129			

The remaining peasant properties are mixed up the one with the other and are not available for 'this separate' treatment. For peasant properties of which the lands lie together, there are in respect of the Province of Saxony for 1858 similar statistics to those for privileged estates, as in the following Table :—

Provincial Districts.	Value.	Debt.	Free from Debt.	In Debt to ¼.	From ¼ to ½.	From ½ to ⅔.	From ⅔ to Value.	Total.
	£	£	No.	No.	No.	No.	No.	No.
Magdeburg	15,788,511	2,246,570	7,214	4,053	2,178	537	465	14,477
Merseburg	15,977,058	2,8[illegible],423	7,193	5,657	3,737	967	794	18,348
Erfurt	1,881,570	438,502	1,103	910	995	260	300	3,568
Total	33,647,139	5,510,495	15,540	10,620	6,910	1,764	1,559	36,293

It may be remarked upon this Table that the proportion of debt to value is less than in the corresponding Table respecting the privileged estates in Saxony. If this hold true of

* In the original the sizes are in "hufen." The "hufe" is here taken at 30 morgen or 20 acres. *Vide* definitions and terms.

the rest of the Monarchy then the privileged estates would appear not only to be on the whole mortgaged to more than half the value, but also to be in some parts of the Kingdom mortgaged for much more than half their value. But these partial statistics offer no sufficient standpoint for forming an opinion on this or any other point of interest in connection with the land debts in Prussia.

These few statistics on the mortgage system will, however, give a restricted indication of the facts which accompany the law of mortgage.

(γ.)—*Results of Compulsory Sale at Law.*

210. The statistics on the results, or rather the accompanying facts of the law on this subject are imperfect. In 19 judicial districts 67 privileged estates and 2,038 peasant estates were in 1854-56 sold by compulsory sale, and the yearly average was 22 privileged estates and 678 peasant estates. For the Province of Saxony the statistics are more complete. Of the privileged estates there were thus sold—

In 1852..	..	..	4	In 1855..	..	1
1853..	..	..	4	1856-57	..	None
1854..	..	..	1			10

Of the peasant estates there were sold—

In 1852..	..	..	59	In 1856..	..	89
1853..	..	..	88	1857..	..	75
1854..	..	..	101			509
1855..	..	..	97			

These statistics do not, however, enable one to form any idea of the compulsory sales at law of estates throughout the Kingdom or even to obtain any idea of how far the peasant properties are sold in this manner. But the year-book of 1858 of the Agricultural Board gives a more complete summary of the compulsory sales at law.

	Number of Compulsory Sales at Law carried out, in respect of—		
	Privileged Estates.	Other Country Properties.	Town Properties.
1858	79	3,158	1,904
1859	64	3,306	1,850
1860	66	3,651	1,999
1861	46	3,295	1,761
1862	24	2,741	1,251
1863	19	2,584	1,538
1864	33	2,863	1,651
1865	41	3,257	1,790
1866	54	3,784	2,098
1867	77	5,333	3,200
Total ..	503	33,972	19,042
Yearly average ..	50	3,397	1,904

The privileged estates numbered, in 1866, 12,150, and out of these the large proportion of 503 was sold in this period 1858 to 1867, or in the ratio of 1 to 24. The non-privileged estates, *i.e.*, peasant and other properties exclusive of town properties, seem to have numbered in 1858, 2,172,000 and out of these the smaller proportion of 33,972 was sold, or in the ratio of 1 to 64. After all due allowance for the greater frequency of private sale in the case of small and especially very small properties, does the comparison of the two ratios warrant the inference that privileged estates are sold more frequently than peasant and other properties?

As to sales for division.

211. The following Table from the same source is also interesting. It includes, however, only two judical Departments :—

	Number of Compulsory Sales at Law in the 'Kammergericht' and the Department of Posen in respect of—							
	Privileged Estates.		Other Country Properties.		Town Properties.		Total.	
	For Debt.	For Division.	For Debt	For Division.	For Debt.	For Division.	For Debt.	For Division.
1858 ..	16	..	279	32	296	53	591	85
1859 ..	15	..	310	32	266	42	591	74
1860 ..	17	3	380	39	357	50	754	92
1861 ..	9	..	345	39	264	52	618	91
1862 ..	5	..	248	36	248	46	501	82
1863 ..	12	..	255	39	267	34	534	73
1864 ..	8	1	250	36	221	66	579	97
1865 ..	5	1	296	27	414	57	715	85
1866 ..	8	2	363	25	445	33	816	58
1867 ..	5	..	492	46	710	57	1,207	103
Total ..	100	7	3,218	343	3,588	490	6,906	840

From this Table it will be seen that of the privileged estates compulsorily sold one-fifteenth were sold for reasons of division, and of the peasant and other landed properties more than one-tenth were sold for reasons of division. It is rather curious to find that the larger proportion of peasant and other landed properties should be approached so nearly by that of privileged estates which were sold for reasons of division on inheritance. This fact is contrary to what one would have expected, for one would rather have expected to find a wider difference between the ratios. It may also be noticed as a collateral fact that the sales by reason of division on inheritance reached to one-seventh of the sales of town plots and sites. The reason probably is the fact that in the towns the custom of equal division of property amongst the children has long obtained. Of two other judicial districts it is known that of the total number of landed properties compulsorily sold, 4,336 were sold for reasons of debt, and 350 for reasons of division on inheritance, being about the same proportions as in the former two judicial districts.

(δ.)—*Results of Real Credit Institutions.*

212. The form of credit institutions known as the Mortgage Debenture Associations, will be separately treated in the first part of this section. It will there be seen how little information of use for the purposes of this Report is known respecting even credit institutions which have existed for the greater part of a century, and which have a much wider sphere of activity than any other credit institutions. Of the other purely credit institutions very little is known as showing the assistance which they render to agriculture or the proportions in which large and small proprietors avail themselves of that assistance, or lastly the object for which that assistance is requested. But the following paragraphs will contain whatever is at hand for immediate use, and any information which may be subsequently acquired will be embodied in that portion of the subsequent part of this Report, which shall briefly refer to the question of real credit apart from its legislative aspect. In reviewing the legislation affecting credit institutions it will be recollected that the rent-charge banks were noticed, as certainly bringing assistance to real credit, although they were founded for a special object and not for the general object of aiding agriculture in its development of the land.

(1.)—*Results of the System of Mortgage Debentures.*

213. The materials for ascertaining the results of this system are more scanty than those for ascertaining the results of any other important branch of the legislation affecting land. The statistics, however, offer some indications in respect of the system of mortgage debentures. The statistics of the mortgage debentures were assembled in an article by Mr. Brämer, in the "Prussian Statistical Journal," and extend only from 1805 to 1865. It is not, therefore, possible to offer any indication of the working of these Mortgage Debenture Associations in the past century.

The first Table shows the amount of Debenture Debt in 1805 and in each succeeding tenth year to 1845, and the amounts for 1850, 1859, and 1865. The figures are not quite complete, but they suffice for the present purpose:—

Year.	Amount.	Increments.	Rate of Increase.
	£	£	Per cent.
1805	8,083,746	..	..
1815	9,482,142	1,348,396	16
1825	12,639,309	3,157,167	33
1835	15,205,665	2,566,356	20
1845	16,268,709	1,063,044	7
1850*	17,799,613	1,530,904	9
1859	19,890,451	2,090,838	12
1865	25,914,155	6,023,704	30

The second Table shows the issue and redemption of mortgage debentures in similar decimal periods from, from 1815 :—

	Issue.	Redemption.
	£	£
1815–25	4,001,066	629,028
1825–35	3,455,350	884,335
1835–45	2,987,893	1,933,577
1845–55	4,267,892	1,898,252
1855–65	9,219,889	1,949,852
Total, 1815–65 ..	23,932,090	6,495,044

The third Table gives the maxima and minima of quoted prices every tenth year :—

	East Prussia.		West Prussia.		Posen, 4 per Cent.		Posen, $3\frac{1}{2}$ per Cent.		Pomerania.		Kur and Neumark.		Silesia.	
	Highest.	Lowest.	Highest.	Lowest.	Highest.	Lowest.	Highest.	Lowest.	Highest.	Lowest.	Highest.	Lowest.	Highest.	Lowest.
1815	91	$69\frac{1}{4}$	$89\frac{1}{2}$	$64\frac{1}{2}$	..	..	..	..	$102\frac{3}{4}$	$95\frac{1}{2}$	102	$93\frac{1}{2}$	99	$81\frac{1}{2}$
1825	$92\frac{3}{4}$	$86\frac{3}{4}$	$90\frac{3}{4}$	$85\frac{3}{4}$	97	$89\frac{3}{4}$	..	..	$101\frac{3}{4}$	$100\frac{1}{4}$	103	$100\frac{1}{4}$	$105\frac{1}{4}$	$102\frac{1}{4}$
1835	$102\frac{3}{8}$	$100\frac{3}{4}$	$102\frac{5}{8}$	$100\frac{3}{4}$	$103\frac{1}{4}$	$102\frac{1}{4}$	..	..	$106\frac{1}{2}$	$104\frac{1}{2}$	$106\frac{3}{8}$	$100\frac{1}{8}$	$107\frac{1}{8}$	$105\frac{3}{4}$
1845	$100\frac{1}{4}$	$96\frac{1}{2}$	$98\frac{3}{4}$	$96\frac{1}{4}$	$104\frac{1}{2}$	$101\frac{1}{2}$	$98\frac{3}{4}$	94	$100\frac{1}{4}$	97	$100\frac{1}{2}$	97	100	$96\frac{3}{4}$
1855	$94\frac{3}{4}$	$90\frac{3}{4}$	92	$87\frac{1}{4}$	$102\frac{1}{2}$	100	$94\frac{3}{4}$	$91\frac{1}{2}$	$99\frac{1}{2}$	92	99	$96\frac{1}{2}$	94	$91\frac{1}{4}$
1865	86	$80\frac{1}{4}$	$85\frac{1}{2}$	$80\frac{1}{8}$	$103\frac{1}{2}$	103	$97\frac{3}{4}$	$95\frac{1}{2}$	$85\frac{5}{8}$	$82\frac{1}{2}$	$87\frac{7}{8}$	$82\frac{5}{8}$	93	$87\frac{3}{4}$

The last Table gives the amount of arrears of interest in the same tenth years :—

	East Prussian Association.	West Prussian Association.	Posen Nobles' Association.	Pomeranian Association.	Kurmark and Neumark Association.	Silesian Association.
	£	£	£	£	£	£
1815	238,995	No return†	..	12,024	3,702	88,249
1825	136,111	„	389	10,573	2,923	50,592
1835	14,274	28,987	10,878	8,228	1,181	44,375
1845	688	1,275	1,276	3,827	995	6,270
1855	238	39	7,673	108	204	1,484
1865	3,662	198	No return	245	493	6,363

Distribution of debenture debt.

214. Mr. Brämer remarks that, of the total of debenture debt in 1865, the sums of 131,392*l.* in West Prussia and of 379,670*l.* in Silesia, were owing by the lands of peasants and yeomen, and that the far greater portion of the remainder, about 25,500,000*l.*, was owing by privileged lands. But, he adds, it does not follow that the owners are really indebted to that amount, for many landowners are in possession of their mortgage debentures. The debt of the peasant lands is insignificant, and the debt of the privileged lands a relatively small proportion of the value even of the mortgaged lands. It will, however, be remarked that the total debenture debt increased after twenty years by more than 50 per cent., after forty years by 100 per cent., and after sixty years by more than 300 per

Its increase.

* From 1850 all the existing Associations, except the Saxon, were in operation. The year 1859 is selected because, from that date there has been a rapid increase of the Mortgage Debenture Debt.

† In 1814 it was 288,445*l.*, and in 1827, 199,912*l.*

cent. If it be assumed that the quantity of privileged lands has not been diminished and that they have trebled in value, then the ratio of debt is the same now as in 1865. But was that ratio relatively moderate in 1865, or on the other hand are these assumptions correct? The general opinion seems to be that the privileged lands are deeply in debt; and it is a fact that they have been and are passing from the possession of the nobles to the possession of capitalists and others. The great increase of the mortgage debenture debt in the period of 1855–65 is remarkable, and the more so when considered in connection with the figures of the second Table for the same period.

The editor of the "Statistical Journal" refers to the fact that about that time the rules of the Mortgage Debenture Societies were altered so as to permit of the issue of debentures to a further increase of 10 per cent. of the previous limits of credit, but seems to think that that cause alone is not sufficient to account for it. The increase of debt is not only in respect of lands on which debentures can be issued, but also of other lands. The inquiry into the question of land credit and land debts, as such, belongs rather to a subsequent part of this Report. If the sudden increase of debentures in the years 1859–65 be compared with the increase in 1850–59, it results that whereas in the earlier period the annual increase was about 230,000*l.*, in the later period it was as much as 1,000,000*l*, sterling. Now, if 10 per cent. be allowed (on the assumption that former mortgagors fully availed themselves of it) for the enlargement of the limits of credit, then the difference between the annual increments is still about 500,000*l.* sterling. But whatever that may mean, the increase in the issue of mortgage debentures shows the expansiveness of these institutions. Then comes in the disturbing element of market value, and after every allowance for difference in the prevailing rate of interest in the money market, it seems that these debentures are not in as good a position as they were twenty and thirty years ago.

From 1865 to 1868 the issue of debentures has increased by 2,700,000*l.*, being an annual increase of 900,000*l.* This annual increase is in excess of the annual increase from 1859-65 by 250,000*l.*, after allowing in both for the full use of the enlargement of credit.

215. The present (October 28) prices of mortgage debentures are as follows:—

Denomination.	Interest.	When next Due.	Quotations.	Interest on Investment and on Mortgage Loan.
East Prussian	4	December 1	78	5·24
West Prussian	4	December 1	80½	5·03
Posen (New)	4	January 1	81½	5·00
Saxon	4	January 1	81	5·02
Silesian	4	December 1	None*	..
Westphalian	4	December 1	78½	5·05
Kur and Neumark	4	January 1	80	5·04
State loans	4	April 1	83 to 84	4·85 to 4·75

The price of the Prussian 4 per cent. State loans has been added for comparison. It is only fair to notice that throughout the period to which the preceding statistics have belonged, the prices of the mortgage debentures were higher that the price of the corresponding Prussian stock. Now, however, the Prussian stock has the advantage.

Mortgage debt in Silesia.

216*a*. As to the proportion of debt to value of land and property in Silesia, Dr. Mascher has, by a detailed estimate of the increased value of land and of the increased value of cereals, &c., arrived at the conclusion that to the year 1862 the increased mortgage debenture debt is not in proportion to those increased values, and that the difference is 49 per cent. in favour of the land now. He attributes this favourable result to the principle of the sinking fund. No doubt that principle has been very beneficial.

The Debenture Associations.

216*b*. It is usually stated that these institutions could still considerably extend their loans on mortgage without endangering their solvency. But unless the above prices in their fall below par represent only the difference between the market rate of interest and the fixed rate attached to the debentures, this would scarcely seem to be the case. It is generally acknowledged that their principles of valuation require improvement, and that all the institutions require many a reform. From their varying legal incidents these institutions cannot be centralized, and cannot therefore receive any benefit there may be in centralization. But, although they need reforms and adaptations to the changed monetary conditions of the age, there is no doubt that they have been of essential service to both the large and small landed proprietor (but chiefly to the former) within the sphere of their

* This price is about 85.

operations. The capitalists have gained also by them. By buying the mortgage debentures they have safely invested their capital with the security of land at the current rate of interest without the disadvantage of imperative investigation into titles and value of the land, and of frequent recourse to legal proceedings for calling in their loans. Yet, however great has been the benefit formerly derived from these institutions and however great may be the present benefit, it is universally admitted that they are far from meeting the existing conditions of real credit.

It is much to be regretted that the statistics at hand do not offer any indications for answering many important questions in this branch of the inquiry, such as those relative to the size of the smaller mortgaged properties, of their number, of their compulsory sale, of the object of the loans obtained, &c. To collect such information would require a considerable time, but it is hoped that some information of the kind will be obtained for insertion in a subsequent part of this Report.

(2.)—*Result of Rent-Charge Banks.*

217. Rent-charge banks have been established at Berlin, Breslau, Königsberg, Magdeburg, Münster, Posen, and Stettin. The result of the establishment of these banks in facilitating the commutation of real charges and services and of rights of common, is so obvious and has been so manifest in the course of inquiry into the results of those kinds of commutation that it requires no further notice.

The following Table may, however, be added for the purpose of showing the business which has been transacted to October 1865, by the rent-charge banks:—

Banks.	To October 1865 the Rent Charges undertaken were					The Commutation Debtors have received.			Capital paid back.	Debentures paid off.	The Commutation Creditors have received in Debentures in lieu of 18 years' Capitalization.
	To $\frac{9}{10}$ths of the full Charge.		Total.	To Amount of Full Charge.	Total of both forms of Rent Charge	In Rent Charge Debentures.	In cash.	Total.			
	From the Crown.	From Private Individuals.									
	£	£	£	£	£	£	£	£	£	£	£
At Berlin	5,389	63,359	68,748	7,599	76,347	1,677,757	1,958	1,679,715	54,675	181,988	102,784

In the Eichsfeld ...	...	...	...	...	...	171,896	...	171,896	8,785	29,552	...
Total	59,405	438,755	497,160	45,288	542,448	12,431,503	14,161	12,445,664	300,467	1,333,301	...

It will be recollected that commutation debtors had the faculty of offering the capital down at eighteen years. From this Table it can be seen to what extent the commutation creditors refused to accept the payment of that capital. They declined the offer to the amount of two-fifths of the capital thus paid, and consequently received rent-charge debentures in its stead. It will be noticed that to 1865 the banks had paid out in debentures and cash about 11,969,218*l.* I am informed that the total sums paid out by them to the present date amount to 13,250,000*l.* It will be observed that the mode of sinking fund, in which the remission of the tenth was a feature, was almost exclusively chosen. The other mode was selected for scarcely a twelfth of the whole business. The business of the banks extended to twelve-thirteenths of the total business in rent-charges. It may be added that at the end of 1868, of the 12,782,683*l.* worth of rent-charge debentures issued the amount of 1,711,015*l.* or about one-eighth had been paid off.

It will be remembered that the rent-charge debentures bear 4 per cent. interest. The price for each 100 thalers is now in the market from 84 to 89 thalers.

(3.)—*Results of other Banks and Institutions.*

218. First amongst these are the Savings Banks, for they lend chiefly on smaller properties than the Debenture Associations, claim attention. The following Table shows the amount of their loans on mortgage in the years from 1857 to 1865:—

	On Town Properties.	On Country Properties.		On Town Properties.	On Country Properties.
	£	£		£	£
1857 ..	1,058,519	925,379	1862 ..	2,300,018	2,408,917
1858 ..	1,600,032	1,631,585	1863 ..	2,595,485	2,810,677
1859 ..	1,640,287	1,715,121	1864 ..	2,971,114	3,142,235
1860 ..	1,786,548	1,841,925	1865 ..	3,324,700	3,636,920
1861 ..	2,015,997	2,099,758			

Thus in eight years the aid rendered by these Savings Banks has quadrupled.

219. The following Table shows the results obtained, so far as their loans on mortgage appear in their accounts, by the other real credit institutions which, since the concession of freedom of banking and of commercial association under conditions for the most part common to all countries, have sprung up to assist the landowner and agriculturalist. The Associations are, however, for the benefit of shareholders, who expect usually as good a dividend from their investment as from other forms of investment. These mortgage banks are in fact associations to intervene between the land debtor and the capital creditor with all the advantages of such intervention, but with the disadvantages of having to satisfy the expectations of shareholders. They want the principle of self-help which exists in the mortgage debenture associations, and which could be extended in the institutions of Savings Banks in more or less direct imitation of English Building and Land Societies:—

	Year.	Loans on Mortgage.	Debenture Issue.
		£	£
Schaffhausen Bank in Cologne ..	1864	72,219	..
Silesian Bank at Breslau	1865	57,007	..
Prussian Mortgage Company ..	1866	287,286	133,205
Prussian Mortgage Bank	1865	82,536	..
Total	..	499,048	

The statistics at hand are not sufficiently detailed to allow of including the mortgage loans of the other mortgage body of Companies; but they would be overestimated at another 500,000*l.* It will be observed that the total assistance by these institutions to landed property and agriculture amounts to about 1,000,000*l.* sterling, which is but a small part of the 335,000,000*l.* to 353,000,000*l.* sterling, estimated in the β section of this sub-division to be provided by private lenders, *i.e.*, other lenders than the mortgage debenture associations and the savings' banks.

The foregoing observations have referred exclusively to loans on mortgage, for it is impossible to ascertain to what extent loans not on mortgage but in aid of agriculture are made by these or any other credit institutions.

(*f.*)—*Summary of Results.*

220. The accompanying facts of the laws have been only cursorily, and in some cases defectively, set forth in this sub-division. But the important results of the national agriculture legislation stand clearly out from the results of other legislation by their definiteness. These have been the conversion of the feudally-subjected peasant with more or less imperfect rights of property in land into a perfectly free peasant with absolute ownership of lord subject only to remaining rent-charges for commutation; the conversion of the feudally-restricted land, with more or less perfect rights of property in his lands, into a perfectly independent landowner with absolute ownership of his lands, subject to restrictions from entails only; the abolition of tenures, charges, and services arising out of the old agricultural organization; the relaxation of the system of entails; the extinction of the baneful and almost universal rights of common; the introduction of fruitful principles of consolidation of intersected lands, and of associations, under compulsion if needs be, for land improvements; and the establishment of great freedom of exchange in land. These have been the direct results of these laws. But they alone have not sufficed to give its present prosperity to the national agriculture. Other parts of Prussian legislation have had a more or less direct influence on that prosperity.

221. The accompanying facts of the laws limiting the right to dispose of land show that this limitation is exceptional and of comparatively little influence, and is likely to be diminished in importance. If, too, the system of entails establishes such a limitation, the system of indefeasible heritages not only has an influence in checking the increase of restrictions on the right to dispose of land by such a system, but also a tendency to acquire such an importance as with the collateral working of public opinion against entails to abolish the system in accordance with the Constitution. The laws of intestate succession by the prescription of equal division of land, as well as of other kinds of property, also tend towards this result, for they run counter to any custom of a different division or disposal of property, which may obtain in the directions of a will.

222. The accompanying facts of the law of landlord and tenant show that the agricultural tenants constitute a practically unimportant portion of the national economy,

and that they are mainly found on lands, such as Crown lands and entailed lands, which are not alienable, or in portions of the Kingdom where the yeomanry and peasantry have disappeared, as in New Pomerania and Rügen, under the influence of an unfavourable legal system. Wherever they exist, there seems to be however no trace of the system of tenants-at-will, or of the system of letting farms without the necessary tenements or of the right or custom of resuming possession of the lands without compensation for the erection of the absolutely necessary buildings. On the contrary, wherever agricultural tenants exist, they seem to be in the possession of leases usually of long terms of years; they receive the land with all necessary buildings, and sometimes with all necessary stock and implements; and they, therefore, do not need to erect buildings, and do not require consequently any protection against any custom of summary ejectment without compensation for them. The tendency of the law is to protect the cultivator against the landlord, and it may be safely inferred that Prussian Law would, on the case occurring, extend its protection to the cultivator under the system which often obtains in Ireland. The set of facts accompanying the law of landlord and tenant will not, however, be complete until the more purely agricultural facts are set forth in the subsequent part of this Report.

223. The accompanying facts of the laws of real credit, so far as they could be stated, speak for themselves, and need no further reference until the relations of capital in the agricultural system have been investigated.

224. From the more or less direct results of each part of the legislation reviewed an idea may be formed of its direct action upon the development of agricultural property and of national wealth and welfare. To this aggregate must be added the balance of the indirect action of each part of other legislation in aid of, or in opposition to, such a development as the grand effect of these results. In other words, all the forces set in motion and not merely this or that force must be studied in order to obtain an accurate idea of the resultant; and conversely that resultant must not be attributed to the action alone of this or that force.

(D.)—General Remarks on the Legislation and its Results.

225. At the beginning of this century Prussia commenced a threefold task; she had retained till then the feudal system in some of its most objectionable features. She found her subjects divided into nobles, townsmen, and peasants. Each class was carefully restricted by law from mingling the one with the other in any way whatsoever, and the lands of each class were scrupulously maintained in its possession; thus the landed estates of nobles, of townsmen, and of peasants, were for ever distinct and separate. The noble could not, since a century before this century began, annex the smallest portion of peasant land, but was bound under heavy fines to find a peasant occupant for every vacant farm, and was bound to represent the peasant in all fiscal matters. The noble's position was barely tolerable, and the peasant's position was intolerable. Only in the towns was there the semblance of free life, and indeed from them, as from towns in other countries, were scattered abroad the seeds of liberty and progress. The nation was burdened by the cumbersome system of the middle ages, and writhed in an agony of serfdom and imprisoned force. Prussia, therefore, set herself to the threefold task of a regulation of the property relations of her subjects, of a commutation of the real charges and services upon their lands, and of an extinction of the rights of common which hindered her agricultural progress. In the present year that threefold task is nearly accomplished. The task of regulating the property relations is, after some vicissitudes, quite accomplished; the task of commuting real charges and services has been nearly accomplished; the task of extinguishing rights of common is also nearly accomplished. As regards the regulation of property relations the various degrees of serfdom attached to peasant property were at once abolished, but the various tenures, charges, and services, arising more or less out of the feudal system were not all abolished until after the legislation of 1850 had come into operation. The reactionary declaration of 1816 mainly caused this delay, and even in 1853 there was a slight reaction, for that most prejudicial condition of the 1816 definition of a peasant farm—the condition respecting the land tax—was again attached to the right of claiming regulation. This obstruction was, however, soon removed; and now, to the enormous advantage of descendents of lords and peasants, all privileged lands are the free property of the owners, and all peasant lands the absolute property of peasants,* subject to the yet remaining rent-charges.

As regards abolition of real charges and services these have all been made subject to

* It need not be repeated that in the term peasants ("bauern") were included all landowners not of a town or of a noble family. It is equivalent to peasantry, yeomanry, &c. *Vide* Appendix of Definitions and Terms.

commutation, and have nearly all been commuted. The only charges as yet uncommutable are the ecclesiastical dues of all kinds, which have only been dealt with in Silesia.

As regards extinction of rights of commons, about one-twentieth of the task remains to be done, and the greater part of this twentieth has already passed through the preliminary stages of extinction.

The result of all this legislation is, that land is the absolute property of a large number of owners, that each owner is quite independent of any other owner, and that any other relations between man and land are rare throughout the Kingdom. The various tenures which obtain in England and Ireland exist no longer in their corresponding forms in Prussia, whatever local customs corresponding to gavelkind, borough English and the like, may still remain.

226. The Prussian legislation has been followed by similar legislation in Austria in 1848, and in Russia in 1860, with various deviations; but it cannot be likewise initiated for Ireland. The task of Ireland is an essentially different task. There is a regulation of property relations to be desired; but the property relations of Ireland in 1869 are not those of Prussia in 1807. The feudal system has long ago disappeared. There are no *glebæ adscripti;* there is no prohibition of removal; there are no prohibitions as to exercising callings, or as to acquirement of lands; there are no peasant lands which the lord cannot annex; there are no peasants out of whose families the lord must select heirs for their holdings. On the other hand, there are no lords who must keep peasant holdings tenanted by peasants; who must pay the peasant's taxes; who must support him in destitution; who must build and repair his houses and farmsteads. In a word, there have existed in Ireland to the present day no yeomanry and peasantry who have remained from generation to generation in possession, however imperfect, of lands which could not be absorbed by the lords of the manor or the larger landowners. Moreover, it must be borne in mind that the carefully-protected existence of such a yeomanry and peasantry in past centuries is the antecedent reason of the great success of the agricultural legislation in Prussia.

In Prussia there were (apart from the incidents of the feudal system) large estates farmed by their proprietors, and on and around them were properties of various sizes held by peasants who were under obligations to render certain agricultural services to the proprietor of the large estate. The agricultural labour was, in fact, performed by the more or less perfect peasant proprietors, and the real agricultural labourer was an almost unknown species of human being. In Ireland the case is, for the most part, the reverse of all this. The landed proprietor has no large estate farmed by himself. He has no peasants *settled* in more or less independent properties from whom he can exact agricultural services for the cultivation of his estate, if he desired to cultivate it. He does not, however, cultivate it, but lets it to agricultural tenants, or suffers the descendants of the original peasantry to remain on his land. And the agricultural labourer is, on the contrary, a well-known variety of the human race, upon whom the tenants rely for agricultural labour. The existing agricultural economy of Ireland is thus, for the most part, an antithesis of fact to the agricultural economy of Prussia at the beginning of this century. Moreover, the Irish landed proprietor has neither the obligations nor the rights enumerated in paragraph 47 of this part of the Report. Neither has the peasant the obligations and rights enumerated therein. The cases are by no means parallel.

But if there be no parallel between the two cases, there may be points of contact as well as of divergence. In Prussia the State has simplified the holding of land by abolishing every kind of tenure arising out of the old system. Landed property is always absolute property, and no limited title can be attached to a landed property on its alienation or bequeathal. The tenants for life of estates in *fidei commissa* or of fiefs do not, it is true, exercise full powers of disposal, but the tendency is to abolish those restrictions. The relationship of a large landowner living on his rents and of farmers cultivating his lands as tenants-at-will does not exist. The desire of the cultivator to own land is the same in both countries, but the principle of absolute property in the land for the cultivator is wanting in Ireland. Hence, in Prussia, that desire is satisfied, and in Ireland that desire is unsatisfied. The policy of Prussia has been to give absolute ownership in land to all persons who in 1807 had more or less perfect proprietary or even possessory rights. In some cases that absolute ownership has devolved upon many persons whose rights were of an imperfect nature. The policy of Prussia has also been not to carry the obligation of compensation so far as to offer a gift with one hand and to render it valueless by the imposition of conditions with the other. Hence, in commutation of real charges and services the State struck out all the ascertained amount of commutation in excess of the two-thirds of the peasant farmer's nett income from the land. Otherwise the peasant might have received a valueless gift, and the policy of the State would have been partially defeated.

Supposing it were resolved upon grounds of political economy and upon grounds of

State policy to invest the Irish peasant with absolute ownership on full compensation, there might be several points of contact between the plan which would be followed in Ireland and the plan which has been followed in Prussia. But it would be premature to try to ascertain them now, and they could only be immaturely ascertained in this Report, as a much greater knowledge of the Irish land question is requisite to render such an inquiry useful. It will suffice to recapitulate the leading features of the Prussian plan. The Prussian legislation had, apart from the abolition of the feudal system, for its object the conversion of all land tenures into absolute ownership. It began by fixing the relations of lord and peasant as they then were. It based upon those fixed relations its plan of regulation. It proceeded to ascertain the obligations and rights on the part of the lord and on the part of the peasant. It denied compensation to certain obligations and rights. It awarded compensation to the remaining obligations and rights. It then proceeded either to strike the balance or to provide the method for striking the balance between them. It laid down the principles of compensation. It foresaw the possibility of that compensation amounting to the value of the peasant's income from the land. It, therefore, prevented that compensation from reaching such an amount as to render the peasant destitute and unable to retain his land, and as to thereby defeat the object of State policy. It recognized, at any rate during part of its period, the inutility of investing a peasant with absolute ownership of his land, unless that land were sufficient for his maintenance. It provided a special quick procedure for all questions of regulation and commutation, and it established rent-charge banks to facilitate the transition from the old to the new system. But if, on the one hand, this is what the Prussian plan did do; this, on the other hand, is what the Prussian plan did not do. It did not start from the assumption that the existing relations between lord and peasant were merely contracts at law to subsist at the will of either party or even of both parties. It certainly avoided this narrowly-conceived legal view, and adopted on the contrary a broadly-developed statesmanlike view of the question of the national property relations.

227. As to the extinction of rights of common and to the consolidation of intersected lands, there need be little added to what has been already observed upon those branches of legislation in this report. England might, perhaps, take with advantage a few hints from the legislation on rights of common, but she could certainly with advantage adopt the principle of consolidating intersected lands into compact farms for the object of promoting agriculture. Neither would it be without benefit to follow the example of Prussia in compelling associations for land improvements, and in making the welfare of the nation superior to the private interest of the individual.

228. As to the question of free exchange in land it is evident how much greater the freedom is in Prussia than in England or Ireland. Comparatively little land is withdrawn from free exchange by *fidei commissa* and the like. The law of obligatory heritages tends to break up estates descending to one only of the family. The law of intestate succession recognizes no succession of land in intestacy to the eldest son or the eldest of the nearest degree, but by prescribing equal division for real as well as personal estate, runs counter to any existing custom of primogeniture or other form of singular succession. Title to land, except in the Rhine Province is clearer and less unassailable, and will soon be indefeasible. Transfer of land is simple. The law of mortgage which has already been in advance of the law of many another nation, is to be liberally improved. Foreclosure and public sale are facilitated. Land credit institutions of various kinds have long been in existence, and have been beneficial, although they in great part no longer respond to the wants of present agriculture. By all these, and last but not least by the prevalence of absolute ownership of numerous owners, the free exchange of land is much in advance of that in many other countries.

229. As to the question of agricultural tenants, either in their legal position or in their economical position, the laws of Prussia and their accompanying facts do not offer much of importance for appreciation. But the great economical fact of their paucity is important; the wide spread if not universal custom, of agricultural leases in respect of their holdings is important; and their better position before the law, in respect of eviction and of the general tendency of the law, is worthy of note.

230. As to the question of real credit, the legislation is in Prussia passing through a period of transition. The ancient system of mortgage debentures had done much for landed property, and had been from time to time more or less skilfully adapted to the changed age, but now the times have been too quick for it, and real credit is gasping for breath. The new legislation will give it more room to breathe, but its vitality will depend upon other influences than the influence alone of law. Both from the old laws and the new laws many an useful inference might probably be drawn as to the best manner of dealing by laws of the State with the difficult conditions of real credit. But it would

exceed the scope of this Report, and would disaccord with my imperfect knowledge of this complicated question and of its legal and economical bearings in England to attempt to draw any such inferences.

231. Finally, as to the question of national progress, there can be no doubt that the national agriculture legislation has been immensely beneficial to Prussia. But it must be repeated that all the pæans in respect to Prussian progress should not be sung in honour of the agricultural legislation alone. Yet this has been the one-sided acclamation of some foreign applauders of the Stein-Hardenberg policy. Moreover, under such a one-sided view of the question has lain the inaccurate assumption that the Stein-Hardenberg Edicts said:—Let there be a free agricultural organisation—and there was a free agricultural organisation. The fiat of Statesmen has no such a rapidly-creating power. This creation required half a century, and progressed imperfectly and slowly in the first quarter. Moreover, it by no means follows that because certain phenomena are observed to succeed a given law, therefore the law and the phenomena are cause and effect. Yet too often is the even pre-adamite error repeated—*hoc post hoc, ergo propter hoc*. The case is rather this—that the nation was ready to soar to its present prosperity and to take advantage of auspicious breezes, but was chained to the ground. She was in fact doubly fettered—enchained by the bonds of her agricultural organisation, and enchained by the bonds of widely-prevailing rights of common. The national agriculture legislation severed the former bonds, and gradually loosened the latter bonds; but, had not the nation been ready to soar, the result of that severance would have been a much less conspicuous soaring. The extinction of rights of common has had a very great influence on agricultural progress and must not be ignored. Nor should the influence of land improvements and of auxiliary agricultural legislation, as materially assisting the agricultural progress of the nation, be ignored. Moreover, it must not be forgotten that industrial progress has acted upon agricultural progress, and they have reacted the one upon the other. Nor must the great advantage to the nation and to agriculture of the development of commerce be forgotten. Thus, even the agricultural progress of the nation is not to be attributed entirely to the national agriculture legislation initiated by Stein and Hardenberg. Still less is the aggregate prosperity of the nation to be attributed to that legislation as the great first cause. Side by side with it there advanced a legislation which displaced hindrances in other directions to the increase of the national welfare. Many industrial monopolies both of the State and of private persons were abolished. The industrial field for the citizen's abilities was extended from the close sphere of his town to the open sphere of the kingdom. Several oppressive inland taxes were abolished, and the tariff of customs duties was amended in a liberal sense. Prohibitions of exportation and importation were removed. Important amendments were effected in legislation on social subjects. New discoveries which are quite independent of any possible legislation have been made in this century of invention, and have most effectively contributed in Prussia, as elsewhere, to agricultural as well as national progress. Then, too, it must not be forgotten that Prussia has proportionately shared in the universal increase of national wealth and welfare. It may therefore be truly said that Prussia, by her agricultural legislation, prepared herself skilfully to take advantage of all opportunities for increasing her prosperity, and that without such legislation she would not have been able to avail herself of them. Let the praise be equitably distributed. But neither let it be maintained that the national prosperity of Prussia is to be attributed solely to her agricultural legislation, nor let it be be ignored that that prosperity owes much, indeed, to the great principles which underlie that legislation. Neither let it be advocated to follow blindly the example of Prussia in agricultural legislation, nor let it be ignored that, though her agricultural conditions were peculiar and her details of operation were specially adapted, yet her principles of agricultural legislation may be suitable to promote agricultural and national welfare in other countries.

Part III.—The Agricultural Conditions of Land.

1. The preceding Part has dealt with the more or less purely legislative conditions of land. This Part will deal with the more or less purely agricultural conditions of land. The domain of the one set of conditions is not, however, sharply defined, or distinctly separated from the domain of the other set of conditions. Hence many facts, which are intimately connected with the facts to be investigated in this Part, have been already stated in the preceding Part. Moreover many facts, which are preliminary to the facts to be investigated in this Part, have been already noticed in the first Part. Thus with regard to certain preliminary matters, there is no need to do more than refer the reader

Facts previously stated.

to the remarks* in Part I respecting the territory and population of Prussia, and the comparative as well as the absolute position of her agriculture. But with regard to other preliminary matters it is desirable to set them forth before proceeding to consider the main subject of this part.

(A)—*General Introduction.*

(*a.*)—*The outward Arrangement of Fields.*

Its influence.

2. The outward arrangement of land as estates has been noticed in the historical introduction to the previous Part. The fact of land having been laid out in accordance with certain standards has been incidentally noticed.† And when it is remembered that nearly a quarter of Silesia was partitioned out in accordance with the two standards therein mentioned, it becomes evident that the ancient arrangement of estates has been of much importance in the evolution of agricultural improvements. For the outward arrangement of the farms influenced the arrangements for cultivation, or in other words the outward arrangement of the fields; or conversely, the system of cultivation influenced the outward arrangement. It scarcely needs one to be an agriculturist to understand how the arrangement of a farm for purposes of cultivation might be prejudicial or beneficial to the interests of the national agriculture.

Outward appearances.

3. The ancient outward arrangement of the fields consisted not only in the adoption of the so-called square plans ("Gewanne") and of certain standards of size, such as the "Flämische Hufe," or the "Frankische Hufe," or others, but also in the employment of a certain manner of applying those standards, as regards the standard of size. The ancient and apparently most usual manner was to lay out the land in parallel bands, parallel with much sinuosity if necessary, but each band with an area equal to the standard of size. The length of such a band was frequently twenty-four times its width. The farmsteads were generally placed on each side of a road, thus forming a village of detached houses, which, however, were seldom beyond a stone's throw of each other, and the bands of land started of course from the sites of the farm-houses.

One variety of the square plan, which was no doubt Polish, but often found in German land, was to place the farm-houses around a large more or less circular open space, instead of along a road, and divide the district into square fields for each step of rotation, and then subdivide these fields amongst the proprietors according to their rights. Another variety was, after laying out the lands in the square fields, to subdivide them in straight parallel bands, according to the claims of the farm proprietors, and to place the farm-houses in a regularly built village, also apart from their lands.

If these facts be seized, it will be easy to conceive what appearance is offered by the outward arrangement of the farms in those numerous parts of the country, in which this system has obtained. Dr. Meitzen has inserted several plans of farming villages in his official work, but they cannot of course be reproduced here. As these narrow bands were often an English mile long and scarcely 150 yards wide, no division in length was practicable. Hence the system of cultivation was carried out by division in width. As regards change of ownership, a farmer desirous of acquiring more land would naturally prefer to acquire the lands next to his own band. This was not unfrequently accomplished, so that farms with land of a width approaching to its length are to be found. But in some districts the subdivision of each farm, and the dispersion amongst different owners of the portions were so great and irregular, that a map of any one of these presents a most confused appearance. Of one of these (Domnowitz) Dr. Meitzen writes as follows, "The peasants declared in 1806 (?) that the intermingling of more than 1,200 parcels of land was so great that in respect of this or that bit, no one amongst them was able to say 'to whom it belonged;' and that several times a bit belonging to one person had been by mistake manured by a second, and then sown and reaped by a third person. They further declared that owing to the reciprocal necessity of passing lengthways or widthways, over such parcels, an extraordinary quantity of seed and cereals was destroyed or spoiled." Another characteristic was the subdivision of the farm into twelve parts. The systems of land division which have been just described have been more fully investigated in Silesia than elsewhere, but are almost universally if not universally characteristic of the ancient colonization of the German and many of the Slave territories now forming the Kingdom of Prussia. The former, as well as the latter, system was also followed by imitation in the laying out of lands for subsequent occupation. As it was not the practice to mark out fixed accommo-

vils of subdivision.

* *Vide* paragraphs 7, 11, 16, 17, 29, 31, and 32 of Part I.
† *Vide* paragraph 6 of Part II.

dation roads or to lay out the ordinary roads with a view to such accommodation, the prejudicial arrangement of the fields was obviously more prejudicial than it need have been. In some measure the agricultural disadvantages of that arrangement were lessened by the so-called field compulsion "Flurzwang," by which the dilatoriness of one individual was not permitted to prejudice the interests of another individual. Hence, whoever had not in the proper time reaped his field was obliged to allow the flocks of the community to pass through his crops. Hence each farmer of the district was compelled to follow a regular style of farming, so that all the fields destined for this or that purpose should be ready at the fixed time. This may not have been without some advantage in the days when agricultural science was an infant and traditional rule of thumb was a king, for it at any rate compelled the lazy farmer to be equal in his activity to the pushing farmer. But on the other hand it is easily conceivable into what a bondage this system threw all farmers in the modern days, who had obtained a little agricultural knowledge. The three field system of cultivation was nearly universal, but the two, four, and five field systems obtained in some parts of the monarchy. But whatever the plan of rotation was, the cultivation of corn was in excess, and the rotation being regardless of the qualities of the soil was seldom without prejudice. Then the general system of cultivation caused other agricultural losses, amongst which may be named the deterioration of the soil and the waste of manure.

Changes by consolidation.

4. It will be desirable, whilst referring to the outward arrangement of farms, to refer to the changes effected in such an arrangement by the operation of the compulsory consolidation in connection with the commutation of rights of common. The districts of Grossengottern and of Alterngottern in the province of Saxony, which have been referred to in paragraph 169 of the previous part, and which constitute an extreme example of subdivision, may be taken as typical of the important and beneficial alteration thus effected. The following details will give an idea of the outward arrangement before the consolidation, and a line will then give an idea of the result of the consolidation.

	Acres.	In Parcels.	Averaging.
In Grossengottern.			Acres.
3 Privileged estates	989	860	1·2
2 Parsonages, 4 schools, 2 churches ..	200	250	0·8
Communalty	258	90	2·8
906 Peasant farmers	2,759	13,200	0·2
328 Proprietors residing out of the district.	349	1,700	0·2
Total	4,555	16,100	0·3
In Alterngottern.			
2 Privileged estates	1,089	900	1·2
1 Church, 2 parsonages, 3 schools. ..	130	220	0·6
Communalty	41	40	1·0
727 Peasant farmers	2,577	17,200	0·15
123 Proprietors residing out of the district.	232	560	0·4
Total	4,068	18,920	0·2

Now, it requires no special remark to point out the prejudicial effect on agriculture of such an outward arrangement of the land, both from the number of separate holdings of one owner, and from the diminutive average size of these separated holdings. The result of the consolidation can be comprehensively stated thus:—After consolidation the 16,100 parcels in Grossengottern became 1,594 holdings, and the 18,920 parcels in Alterngottern became 913 holdings! Some interesting details with regard to similar beneficial alterations of the outward arrangement of fields in a few other districts also exist in Dr. Meitzen's official work and elsewhere, but need not be added to those given of the districts of Grossengottern and Alterngottern.

5. In concluding this cursory notice of this subject, it may be remarked that the perpetuation of the ancient arrangement of fields, and the minute subdivisions of the divisions of that arrangement are in some measure owing to the original laying out of the land; for, as has been seen in the rapid sketch of the outward arrangement of farms and fields, the square plan caused much subdivision at the very beginning, and the standards of the "Flämische Hufe" and "Frankische Hufe" were too small after the tripartite division to bear much subdivision. Then it is to be supposed that, in a district subject to the square plan, if the proprietors wished to change their system of cultivation, they would do so by agreeing to give up the main idea of the ancient division, and by subdividing as might be necessary the subdivided portions they then held. A process of this, or of a

similar nature, would help in addition to equal division on inheritance to account for the minute subdivisions of such a district for instance as Domnowitz, referred to in a preceding paragraph (3).

(*b.*)—*The Unproductive and Productive Area.*

Unproductive area.

6. The proportion of unproductive to productive area is obviously a fact to be ascertained at the outset of an inquiry into the agricultural conditions of land. In the course of this Report, it has been several times mentioned that the total area of Prussia is 71,523,629 acres. This area was exclusive of the water surface along the shores of the Baltic. The following deductions for agriculturally unproductive area, being scarcely 5 per cent of the total area, must also be made :—

	Acres.
For water surface ("Wasserstücke") such as swamps, &c., and some inland lakes, assessed to land tax as yielding a return, however small	1,160,545
For water ways, as navigable streams	266,667
„ including other waters	195,428
For waste land ("Oedland"), such as chalk and clay pits, &c., yielding a return of some kind	95,802
For barren land ("Unland"), yielding no return whatsoever	164,612
For way land ("Wegeland"), *i.e.*, railroads, roads, &c., including cemeteries	1,552,417
Total	3,435,471
There will therefore remain	68,088,158

Productive area.

7. This area is from the agricultural point of view the more or less productive area to be subsequently examined. But from it must in the next place be deducted the area of land occupied by buildings aud by gardens attached to houses. This area seems to be about 716,000 acres, so that the productive area for cultivation will be about 67,372,158 acres. This agriculturally productive area is thus composed :—

	Acres.
Arable land ("Ackerland"), chiefly used for cereals	36,758,715
Vineyards	31,199
Garden land ("Gärtenland"), *i.e.*, land for cultivation of vegetables, fruits, commercial plants, flowers, &c.	488,076
Meadows ("Wiesen"), *i.e.*, grass land which is usually mown	6,805,292
Pasturages ("Weiden"), *i.e.*, grass land which is usually grazed	5,424,783
Wood land ("Holzungen"), including all land which mainly grows wood or timber	17,864,093
Total	67,372,158

One remark only is required upon the foregoing calculations. The bracketed German terms are the technical terms to which the law of the land-tax has attached the definite meanings which are here given. Vineyards have been separated from "garden land," but are usually included therein.

It is unnecessary, at this preliminary stage of the agricultural part of the inquiry, to show province by province the proportions of each kind of surface forming the aggregate of unproductive and productive area. But the proportions in the monarchy may be now stated :—

Arable land	40·9	Wood lands	34·0
Vineyards	0·5	Way land	2·2
Garden land	0·5	Water surface	0·6
Meadows	9·5	Buildings, &c.	0·7
Pasturages	11·1		100 0

The water ways, waste land and barren land are not sufficiently large to enter into the preceding calculation.

(*c.*)—*The Classification of Productive Land.*

8. By this classification is meant the classification adopted for levying tne land-tax. It is desirable to briefly notice this classification, as it will be of material assistance in the course of the subsequent inquiry to define the agricultural character of any district which may be examined.

Classification of land.

There are eight classes according to the net returns per acre of each kind of surface, excepting of course the "waste land" and the "barren land," viz., of arable land, garden land, meadows, pasturages, forests, and water surface. In the last of these, the division into eight classes is seldom carried out, for few districts furnish more than four classes.

The most productive land of each kind in each district constitutes the first class, and the least productive constitutes the eighth class. The intermediate classes are proportionately established. For each class a specimen portion of land was selected in the district, and the other lands were classed according to those specimen portions. In this manner it was hoped to hit fairly the average return per acre of each kind. The districts are either the departments or subdivisions of them. Of the 333 country departments only 66 were subdivided. It, of course, happened that in many districts the full number of classes did not exist. Hence, in any future reference to the classification, if it be stated that in such a district there are five classes of arable land, it will be meant that the first class is the best of the district, and that the fifth class is the worst, and that there are only three intermediate classes. In other words, the signification will be that in that district the land varies less in agricultural value than in another district, where the land varies sufficiently to provide eight classes. From this short explanation it will be perceived that all the lands of the monarchy grouped in any class, say, in the first class, do not yield an average nett return, but yield a varying nett return according to the district. Conversely, a nett return, which in one district places the land in the first class, will in another district only place it in the second or third class. Whenever land of any particular sort is hereafter referred to as first or second or eighth, or any other class land, these remarks must be borne in mind, and the idea retained that the classification denotes its relative agricultural value in the district named.

Meaning of classification.

(d.)—The Physical Conditions of Prussia.

9. This general introduction to the inquiry into the agriculture of Prussia would not be complete without sketching in outline the physical position of Prussia, for it is evident that the advantages derived from, and the disadvantages imposed by, given physical conditions must have an important influence upon agriculture.

No reference is, however, needed to such well-known facts of physical geography, as to the large eastern plain and the small western plain, or to the rareness and the usually small height of elevated ground, which are the chief features of Prussia. The second map of the Atlas to Dr. Meitzen's official work gives them at a glance. In a previous paragraph (6) the area of water has been separated from the aggregate area of the monarchy. The proportion of water surface to the total area by provinces may be mentioned :—

	Assessed Water Surface.	Public Waters.	Total.
	Per cent.	Per cent.	Per cent.
Prussia	3·0	4·4	7·4
Pomerania	2·3	5·4	7·7
Posen	1·6	0·4	2·0
Brandenburg	2·2	0·8	3·0
Silesia	0·7	0·5	1·2
Saxony	0·3	1·0	1·3
Westphalia	0·1	0·3	0·4
Rhineland	0 1	1·1	1·2
Monarchy	1·6	2·1	3·7

Prussia is watered by the chief streams of middle Europe from the Memel to the Meuse. If the extent of Prussian territory belonging to the basin of each river be regarded, then the Oder, with its 1,874 square geographical miles, is of the greatest importance; the Elbe, with its 852 square geographical miles, follows next in importance; and then come the Rhine and Meuse together, with 720 square geographical miles; and the Vistula, with 648 square geographical miles; the others being of minor importance. It will be remembered* that Prussia takes a first place amongst European States for relative length of navigable rivers. She has about 3,800 English miles of waterways, of which 430 are artificial waterways.

Waterways.

10. If only this short reference to the physical features of the surface be necessary, a longer reference to the conditions of climate and weather in Prussia, and their influence upon agriculture, is desirable. The quantity of rain and the average temperature in each season are obviously of great importance. The following Tables by Dove, from Dr. Meitzen's official work, will therefore be interesting.

Climate and weather.

* *Vide* paragraph 14 of Part I.

The Rhine Valley	1·45	7·25	14·30	7·96	7·74	12·85

Dr. Meitzen remarks that not one of the Stations of Observation varies in an important degree from the average of the aggregate observations in the district on the fall of rain and snow. As regards temperature, the difference between the Eastern Stations and the Western Stations is usually three degrees Réaumur on the annual average, and attains to 4 and even 5 degrees on the monthly average.

Frost and cold, warmth and sunshine.

11. The return of warmth after winter, the dates of first and last frosts, the sudden changes from warm to cold, the number of days of summer heat, and the number of days of sunshine are evidently of great importance. It appears that a temperature of 5 degrees Réaumur (about 44 degrees Fahrenheit), is necessary to cause the vegetation of Prussia to burst into new life. Warm days of that temperature promote this renewal of life; colder days check it. In the first of the five following Tables this amount of temperature is used as a standard. In the fourth Table the standard of favourable summer heat is taken at 15 degrees Réaumur, or about 66 degrees Fahrenheit.

1. Observations from 1849 to 1864.

June ,, ..	17·19	15·06	10·50	12·31	15·82	7·15	15·37	12·13
Of the four months—								
Average	57·51	47·58	35·43	42·43	55·94	30·03	58·99	44·56
Highest No. ..	89	74	70	78	87	52	84	71
Lowest No. ..	24	26	14	13	34	11	35	14
2. In September—								
Average	13·94	11·87	10·44	10·44	15·44	10·50	16·37	11·13
Highest No. . ..	23	17	16	20	26	15	24	21
Lowest No. . ..	4	6	3	5	6	4	10	9

On the first Table it may be remarked, that in the north-east of the monarchy vegetable life has practically no chance of renewal before April, whereas in the west there are more warm days in January and in February than in March in the north-east, and nearly as many as there are in Silesia in March. As spring advances the inequalities are quickly equalized. The second and third Tables show that the above advantage of the western provinces in early warm days, is practically no advantage for agriculture, for hard frosts do occur in March and April and can occur even in May. The extreme limit for frost at Königsberg is 17th May, and at Cologne 28th April, being a difference of only twenty days. If in the west vegetation springs up earlier, it runs a greater danger from frost and cold than the vegetation of the east, which in February and March is still for the most part dead. But the west obtains a greater advantage from its greater length of summer warmth, as shown by the fourth Table. The average of days of sunshine, as given in the fifth Table, varies without regard to east and west or north and south, and it is only in September that the west seems as west to have an advantage.

Averages of temperature.

12. To conclude this short notice of this interesting subject a Table of the averages of the means of heat and cold in the agricultural months is added.

Observations from 1849 to 1864.

If any reader should desire to pursue the subject further into details, he is referred to those which are collected in Dr. Meitzen's Official Work, from which the foregoing Tables have been extracted.

13. The geological distribution of rocks and earths need not be touched; nor do time and space permit of any reference to their connection with the art of agriculture. Neither is it necessary to epitomize the known facts respecting the extent and distribution of the useful minerals. On all these subjects Dr. Meitzen has collected the best and most recent information.

This epitome of the facts preliminary to an inquiry into the agricultural conditions of land will, it is hoped, in spite of its brevity be a sufficient introduction to the main subject. Of this subject the first important inquiry will be into the distribution of land into properties and holdings.

(B.)—*The Distribution of Land.*

Public and private property.

14. The distribution of land into alienable land and into more or less inalienable land has been shown in paragraph 193 of Part II. From the Tables therein set forth

it will be seen also that, by adding to the alienable land the acreage subject to feudal and other entails, the distribution of land into public and private propeaty is as follows:—

	Acres.
Public property	11,217,874
Private property	57,449,677
Area yielding no returns	2,754,430
Total area of State	71,421,981

Distribution of landed properties.

15. The distribution of land in 1859 amongst small holdings, team-requiring peasant farms, and large properties in the eastern provinces, (excepting in the provincial district of Stralsund) and Westphalia was as follows:—

	Acres.	Per Cent.
Large properties	37,899,759	59·73
Team-requiring peasant farms ..	22,332,289	35·20
Small holdings	3,222,551	5 07
	63,454,599	

These per-centages have been quoted in paragraph 179 of Part II, and it has there been remarked that 15 per cent. should be deducted for Crown, mortmain, and municipal properties. If this be done, then, roughly speaking, 45 per cent. of the land is distributed amongst large non-peasant individual proprietors and 40 per cent. amongst peasant individual proprietors. The two classes have nearly an equal share. It further appears that small proprietorship has only 5 per cent. of the land. It is regrettable that the return of 1859 does not include the Rhine Province.

16. It is possible, in consequence of the completeness of the information contained in the local records upon which the basis of value for the land tax is calculated, and in consequence of the information afforded by the levying of the income-tax, to set forth at a given date the distribution of property in land throughout the Kingdom and to set it forth with a great exactness. But this work has yet to be done, and would require an enormous expenditure of time. The result would, however, be so valuable and interesting that it is to be hoped that Prussia will soon undertake the task. Some less comprehensive inquiries in this direction have, however, been made.

The following Table embodies the chief points of interest:—

SMALL PROPERTY.

NOTE.—"Near Towns, &c.," is adopted as the translation of "Stadt-fluren," and includes all lands belonging to the Municipalities or Public Bodies, or Private Individuals of the Town, and lying around the Town. Township lands is the nearest English equivalent of "Stadt-fluren."

The first remark on this Table is, that all sites of houses, with or without a house-garden, but without other land attached, are excluded from the enumeration of small properties. In the Kingdom there are 342,745 such sites of houses, either near towns or in the country. The second remark is, that the enumeration is always of properties, but is nearly correct also of proprietors; for as far as possible a plural return from the fact of a proprietor holding properties in different parishes and being returned for each, is excluded. But it has not been possible to similarly allow for this fact of a plural return in regard to the average area of each property; the average areas of properties will sometimes be therefore somewhat larger than in the Table. The third remark is, that as all the parcels belonging to the same proprietor in the same parish are, as far as possible, returned as one property, this Table is no guide to the number of separate holdings. The fourth remark is, that the columns 18 to 23 are inserted for purposes of comparison, but that the lower steps of 45*l.* to 75*l.*, and 75*l.* to 150*l.* were not ascertained except for privileged properties. The fifth remark is, that the return of small properties in 1858 is somewhat inexact, in consequence of the difficulties connected with the subdivision into small parcels; and that the return of large properties is probably too great, as possessions of forests, wastes, ponds, and the like, without any habitation or agricultural establishment upon them, are reckoned for the purposes of the land tax as estates. On the other hand, there seems to be no doubt as to the accuracy of the return of the middle properties and even of the acreage belonging to them. The last remark is, that the returns of 1859 in columns 6 to 9 are given for purposes of comparison. The line drawn between small and middle property at 20 acres, and the line drawn between middle and large properties at 400 acres may or may not be the best lines for comparison, but they are the lines adopted for the existing statistics on this subject.

17. Subject to the foregoing remarks, it will be interesting to contrast the total of 1858 with the total of 1865; thus:—

	1858.	
	Number.	Per Square Geographical Mile.
Small properties	1,696,909	341·00
Middle properties..	404,871	81·48
Large properties	18,197	3·67
Total 1858	2,119,977	426·15
Total 1865	1,817,515	361·7

The discrepancy is owing to the excess in the number of large properties and the excess in the number of small properties in 1858 for the reasons above given. This is seen still more clearly by contrasting the two provinces; thus:—

	Prussia, Per Square Geographical Mile.	Rhineland, Per Square Geographical Mile.
Small properties	84·00	1,582·80
Middle properties	77·27	104·96
Large properties	3·66	3·11
Total 1858	164·93	1,690·87
Total 1865	173·91	1,083·60

The discrepancy in the Province of Prussia, where small properties form scarcely more than half of the total, consists in an increase in 1865 of scarcely 6 per cent.; whereas it in Rhineland, where small properties form an enormous majority of the total, consists in a decrease in 1865 of nearly 40 per cent. It is obviously impossible, under such circumstances, to attempt to ascertain the result of the movement of property from 1858 to 1865.

As to landed properties near towns, &c., and in country.

18. For the purposes of this Report, a number of the properties near towns ("Stadtfluren") and also in the country ("auf dem lande") should possibly be excluded from consideration, as many of them are probably not agricultural properties in any sense of the term. It has been noticed that sites of houses with or without a house-garden attached have been already excluded. Of the smallest properties within the limits of towns and villages, and in the country, it would probably be fair to exclude one-half. But, as this cannot now be done, it will suffice, inasmuch as those near towns are probably the most affected by this consideration, merely to separate all the properties within the limits of towns and in the country respectively from the above totals. Then the following will be the numbers respectively:—

	Near Towns.		In the Country.	
	Number.	Per Square Geographical Mile.	Number.	Per Square Geographical Mile.
Small properties	303,293	61	1,393,616	280
Middle properties	31,092	6·25	373,779	75·23
Large properties	780	0·16	17,417	3·51
Total of 1858 ..	335,165	67·41	1,784,812	358·74
Total of 1865 ..	291,614	58·7	1,525,901	303·0

It may be noticed that the ratio between town landed properties on the one hand, and the country landed properties on the other, is about the same in each year; and that, consequently, there is about the same average amount of error in each category in the reckoning of the small and large properties. There is probably more than this average in respect of small properties, but less than this average in respect of large properties. But, starting from this average amount of error, let a reduction of one-sixth of the totals for small and large properties of 1858 be assumed to render the numbers nearly correct, then

these corrected numbers can, for the present purpose, be assumed to show the distribution of property for 1858 and also the probable proportions of their distribution in 1865. The preceding Table would then become this—

	In Towns.		In the Country.	
	Number.	Per Square Geographical Mile.	Number.	Per Square Geographical Mile.
Small properties	252,744	51·8	1,161,846	233·33
Middle properties	31,092	6·25	373,779	75·23
Large properties	650	0·13	14,514	2·92
Total for 1858 ..	284,486	58 18	1,549,639	311·48
Total for 1865 ..	291,164	58 7	1,525,901	303·00

It will be borne in mind that these numbers of properties are, subject to the inaccuracies already noted or not fully eliminated, the numbers of proprietors, including therein individuals and proprietary bodies. The question of proprietors will be treated of in the following division of this part. The distribution of the land into properties is the subject of this division.

Proportion of number and size of property, &c.

19. Taking first the statistics of 1865, the Table shows the remarkable contrast between different parts of the Kingdom in respect of the number and size of the properties in land. For instance the Province of Prussia has 174·63 landowners per square geographical mile, whereas the Rhine Province has no fewer than 1083·6; and the Province of Prussia has an average size of 360 acres for its landed properties, whereas the Rhine Province has an average size of as little as 11 acres.

Position of provinces in respect of landed property.

Small properties.

The large Table and the subsequent small tables tell their own meaning so plainly, that few further remarks are needed. But, if the 1858 statistics be considered, it may be observed that Silesia and Saxony approach nearly to the general average of small properties per square geographical mile, whereas Westphalia is much in excess, and Rhineland enormously in excess of that general average. The low numbers of the north-eastern provinces are in striking contrast. Moreover, the number of small properties in various provinces is also in striking contrast when compared with the numbers of middle and large properties in the same province. Thus, in Westphalia the small properties form in number rather more than one-half of the total number of properties, whereas in Silesia and Saxony, and in Rhineland, they are probably ten or twelve times as many. As regards the middle properties there is no such striking contrast between provinces. Pomerania has comparatively the least number of middle properties; Silesia, Brandenburg, and Prussia, are below the general average; Saxony and Posen rather above it, and Rhineland and especially Westphalia are much above that average. As regards the large properties their small proportion to the total number of properties, and even to the middle properties will be noticed. It is regrettable that the materials are not at hand for comparing the acreage of small, middle, and large properties.

Middle properties.*

Large properties.

Subdivision of land.

20. From the statistics of 1865 the following Table, showing the subdivision of the land, can be constructed.

* They are four or three times as many.

TABLE showing Subdivision of Land.

		Real Estates yielding Returns.			Subdivision.

N B —The "estate districts" are co-extensive with a sufficiently large manor to constitute a separate district, distinct from the communalties.

The contrast between the eastern and western provinces comes out also in this respect. In the former the average size of the portions of land is 13 acres, whereas, in the latter it is about three-quarters of an acre. Or, to put it in another way, in the former 57,000,000 of acres are cut up into 4,500,000 of separate holdings; whereas in the latter, 11,750,000 acres are cut up into 14,250,000 of "parcels." Rhineland is chiefly responsible for this. There, 6,500,000 of acres are cut up into nearly 12,000,000 of

"parcels." It must, however, be borne in mind that in the eastern provinces a considerable extent of subdivision has been obliterated from the land by the action of the compulsory consolidation in connection with the extinction of rights of common, and that in Rhineland its application has been hitherto resisted, with the recent exception, noted in paragraph 75 of Part II, in respect of the district of Ehrenbreitstein, which is, however, distinguished from the rest of Rhineland by the dominion of the Common Law and by an organization different in some points. It is also worthy of notice that, whereas in the eastern provinces the ratio of subdivision is three to one, in the western it is ten to one.

21. Before concluding this notice of the distribution of land, it will be interesting to give a Table of the privileged estates ("Rittergüter") which remain as relics of the ancient land system throughout the Monarchy. **Privileged estates.**

The number of "Other Estates" given is 2,055, but Other Estates at under £75 and at from £75 to £150 were not counted.

It will not fail to be observed, that some of them are of very small value; most of them are of small value; and few only are of considerable value. The probable acreages, stated under the assessed values, are based upon the average nett return in each step of the land-tax assessment. The actual acreage in any particular provincial district yielding a given nett return necessarily varies much. The suggestive sudden decrease in their number for Westphalia and Rhineland will be noticed.

(C.)—*The Cultivation of Land.*

22. The observations which are made in the following paragraphs on this important subject are, in the main, an epitome of the information contained in the second volume of Dr. Meitzen's official work, which has just been published; but an epitome which is supplemented for the purposes of this Report, by gathering now and then some information from the other books named in the Appendix, and from personal inquiries. One preliminary remark must be made. It will have been noticed, that the systems of cultivation have been referred to as two, three, four, or five "field," &c., using the term "field" instead of "course." The system is now more or less scientifically that of a rotation of crops. But in Germany the system of cultivation was practised by dividing the whole farm into three parts, or three fields, and so on, for each system of cultivation. It has, therefore, seemed to be more distinctive to translate the German term literally, by three field, or four field, &c. Moreover, the form of expression, "three field," is not unknown to our language. **"Three field," &c.**

(a.)—*The Development of Agriculture.*

23. The three-field system of cultivation is now acknowledged not to have been universal in Germany in the days of Roman Conquest. That system, which existed in some Roman provinces, was probably not unknown to the Germans. The first recorded instance of this tripartite division of a farm occurs in the year 771, in respect of a landed property on the Rhine. But the system of winter corn, summer corn, and fallow, was the dominant system of cultivation of the Middle Ages, and forms in modern times the system in use by far the greatest number of farms of the actually Prussian territories, and even yet forms the basis of the majority of and even of the more developed, systems of cultivation. But this system is not more characteristic of the ancient cultivation in the "close villages," **Ancient shift of crops**

than the cultivation in common which sprang from the principle of the land-communities. Indeed, cultivation properly so called, or rather tillage, was an encroachment on the common pasturage; and as soon as the crop was reaped, the cattle resumed their rights of common over the whole district. The "Sachsenspiegel" was explicit:—"If a man let his corn stand when others have gathered in their corn, and if then his corn be trodden down or eaten up, that man has no claim to compensation from any one." Hence the uniformity of crops, and the uselessness of accommodation ways on the land. Thus, the system of cultivation became fixed and unchangeable, and became subject to what is called the field compulsion ("Flurzwang"), by which all cultivators were compelled to uniformity. Then, as the arable land was extended, the rights of common to fallow-grazing, and to stubble-grazing assumed great importance. This system of the "close villages" was naturally followed in the colonized villages, with this exception, that the lord of the manor, who had a kind of monopoly of sheep-rearing, limited the number of sheep to be maintained on a colonist's farm, and retained the right of sending in his flocks to feed on their farms at certain times. Parenthetically it may be observed, that in Norfolk, and probably elsewhere of advanced England, this latter prejudicial right is still to be found, but not in advanced Prussia.

Ancient farming.

24. It is easy to understand how this dominant system of cultivation in many cases brought about the distinctive outward arrangement of fields referred to in the paragraphs 2 and 3 of this Part. Where the so-called square plans ("Gewanne"), existed, each proprietor of a farm received of the easily cultivated land a lesser share, and of the less easily cultivated land a larger share, either undivided, or merely divided in such a manner that each one should be employed in the same manner as all the others in the same part of the district. Thus, each farmer would have a share in each square of land destined for each kind of the three-field system of crops. Of these squares lying together for receiving the same crop, there might be three or more. But the square, or the squares which lay together, in the three-field system formed the first field, say on the south, the second field, say on the west, and the third field on the north and east of the village. The disadvantages of such a system are patent. The disadvantages of the three-field system as applied to land laid out in bands, were quite as great.

Square Plans.

25. Moreover the right of common to pasturage produced a very unfavourable wasteful use of the outlying lands where, with few exceptions, the cattle roamed at will. But such lands were very seldom attached to farms laid out on the Flemish or Frankish standards of size. These farms were close estates, subject to the before-mentioned right of common to pasturage within their limits, but usually with no right of common to pasturage in adjoining lands. So also in many Silesian districts of square fields there were no common lands belonging to the village.

Common lands.

26. From these few remarks it is hoped that a general idea of the low state—one might, indeed, say of the compulsorily low state—of agriculture throughout the territories now forming Prussia will be apprehended. Agriculture was, however, improved by two influences, which are still the moving power of agricultural development; viz.: the older influence of the so-called garden-cultivation essentially connected with the small proprietorship, and the later and probably more powerful influence of the high tillage of the large proprietorship. To the importance of the first, which the monasteries materially aided, the literature of the subject from the beginning of the sixteenth century bears witness. As to the second influence, the large farming proprietor, or in other words the practice of farming by large landowners was an oft-recurring fact in German land at a very early date. In South-west Germany it gradually disappeared, but in North-east Germany it remained to constitute a most important agricultural element. Its influence is also to be traced in the practical treatises of former centuries. But neither time nor space will permit of tracing the gradual effect of these influences. Their actual effect at the present day will, however, be seen by comparing the short description of existing agriculture with the foregoing rapid glance at ancient agriculture and its development. This subdivision cannot be closed without noticing the influence of the State in promoting agricultural development, and without referring to the great reformer of Prussian agriculture at the beginning of this century—Albert Thaer—whose place in respect of the National Agriculture Legislation has already received recognition in this Report. It would be interesting to note the steps in the scientific progress of Prussian agriculture from the time of Thaer to the publication of Liebig's works in 1840, and thence to the present day. But such a notice must be omitted, and the influence of the scientific progress of agriculture in promotion of agricultural prosperity must be taken for granted.

Improvement of agriculture.

27. Before proceeding to the next subdivision it is necessary to allude to the subject of the local distribution and qualities of soils. This subject is evidently of importance amongst the agricultural conditions of land. It is, however, a subject which admits of

Local qualities of soil.

little or no abbreviation without losing its completeness and distinctness. For the variety in quality, in position and in distribution is so great that, unless the broad local distinctions of soil were stated, it would be impossible to give a clear idea of the relative and absolute position of the various provinces of Prussia in respect of their soil. Such a statement of those broad local distinctions should constitute a subdivision of this division. But it would necessarily extend to a greater length than can be allotted to it in this Report.

(*b.*)—*The Use made of the Soil.*

28. The productive area of Prussia has been given, with its distribution amongst the six varieties of cultivation, in paragraph 7 of this Part. The following Table shows its distribution by provinces, and also the proportion of unproductive area.

Of every 1,000 Acres of the Total Area there are—	House and Farm Sites, and House Gardens.	Arable Land.	Vineyards.	Gardens.	Meadows.	Pasturages.	Wood Land.	Water Surface.	Waste Land.	Barren Land.	For Public use, and Yielding no Returns.	
											Land.	Water.
	Acres.	Acres.	Acres.	Acres.	Acres.	Acres.	Acres.	Acres.	Acres.	Acres.	Acres.	Acres.
In Prussia ..	8	505	..	4	112	106	200	31	2	7	18	7
Pomerania ..	8	547	..	3	102	88	198	25	1	4	19	5
Posen ..	9	596	..	5	83	51	216	16	1	..	19	4
Brandenburg ..	8	459	..	8	102	46	323	22	1	..	23	8
Silesia ..	13	540	..	8	89	19	297	7	2	..	20	5
Saxony ..	12	591	..	9	93	52	200	3	1	..	29	10
Westphalia ..	14	416	..	9	77	173	279	1	1	..	27	3
Rhineland ..	14	455	4	9	76	98	307	1	2	..	24	10
Monarchy ..	10	514	7		96	76	250	16	1	2	21	7

Prussia and Pomerania have, therefore, a considerable proportion of arable and meadow land, but a moderate proportion of wood land. Posen has a specially large proportion of arable land. Brandenburg has a specially small proportion of arable land, and the relatively largest proportion of forest. Silesia and Saxony have a large quantity of arable land, a small quantity of meadow land, and a medium quantity of wood land. Westphalia is remarkably poor in arable land and rich in meadows. The Rhine Province has only a relatively medium quantity of arable and meadow land, but a large quantity of wood land. Only one other remark is needed on this Table, but it is one of great interest. The great increase of population, and the correspondingly greater contributions exacted from the soil have not been so destructive of the smaller arts of husbandry or of the forests as might have been expected. In fact the western provinces have in comparison with the north-eastern by no means a preponderating surface of cultivated land. This will be more clearly seen from the following Table, showing the agricultural use of the productive area.

No preponderating cultivation in western provinces.

Agricultural use of productive area.

Of every 1,000 Acres of the Total Area.	Crop-bearing Area.			Grass-bearing Area.			Wood and Timber-bearing Area.	Area yielding scarcely any Returns.
	Under Spade Cultivation.	Under Tillage.		Mown Land.	Pasturage Land.			
	Acres.	Acres.		Acres.	Acres.		Acres.	Acres.
Prussia	12	505	517	112	116	218	200	65
Pomerania	11	547	558	102	88	190	198	54
Posen	14	596	610	83	51	134	216	40
Brandenburg ..	16	459	475	102	46	148	323	54
Silesia	21	540	561	89	19	108	297	34
Saxony	21	591	612	93	52	145	200	43
Westphalia ..	23	416	439	77	173	250	279	32
Rhineland	27	455	482	76	98	174	307	37
State	17	514	531	96	76	172	250	47

This subject has probably an intimate connection with the questions both of small proprietors and high farming, and will be referred to in a subsequent Division. In the meantime it is not to be forgotten that nature as well as man sets limits to the extension of cultivation and especially of tillage.

Favourable and unfavourable soils.

29. The extent of the six varieties of cultivation on loam, clay, sand, bog, and chalk soils cannot be given; but the relations of the chief varieties of cultivation to certain soils of the cultivated land can, in the aggregate, be given as follows:—

	Favourable Loam and Clay Soils.			Mixed Sandy Loam, and Loamy Sand Soils.	Unfavourable Clay Land and Bog Soils.			Water.	Chalk layer under the previous Soils.	Total of favourable Soils.	Extent of Cultivated Land from previous Table.	Per cent. of favourable Soils to Cultivated Land.
	Loam on raised ground.	Loam.	Grey loam (Clay).		Grey Loam (Clay) on raised ground.	Sand Soils.	Bog Soils.					
		In River levels.										
	Acres.	Acres.	Acres.	Acres.	Acres.	Acres.	Acres.	Aeres.	Acres.	Acres.	Acres.	
Prussia	111	18	7	451	33	299	44	37	(1)	587	735	79·9
Pomerania	62	2	2	448	..	354	102	30	(14)	509	748	68·1
Posen	53	14	12	480	15	336	70	20	(0·2)	559	744	75·2
Brandenburg	48	..	41	355	14	425	87	30	(0·0)	444	623	71·3
Silesia	229	46	31	285	62	313	22	12	(23)	591	669	88·4
Saxony	272	82	26	195	128	251	33	13	(42)	575	757	76·0
Westphalia	430	40	11	105	124	246	43	1	(118)	586	689	85·1
Rhineland	236	44	34	217	361	88	17	3	(59)	531	656	81·0
State	158	27	20	344	77	300	52	22	(24)	549	703	78·1

From this it will be seen that tillage, meadow, and pasturage land have occupied in every province a considerable of unfavourable soil. In Pomerania and Brandenburg, this has occurred to a larger degree than in Silesia and Westphalia. Posen and Saxony are rather above the average for the Kingdom, and Prussia and Rhineland rather under the average. Here again we encounter a fact of important bearing upon the question of small proprietors and of high farming, to be referred to hereinafter.

Science of agriculture.

30. The science of Agriculture in Prussia cannot of course be examined here not only for want of time and space but also for want of competency. But as a branch of the chemical treatment of the physical qualities of the soil, the following Table showing so far as is known, the extent to which agriculturists have availed themselves of the new system of sub-soil drainage will be interesting, even without being compared with the local qualities of the soil in each Province. The Table is defective for a few places, but is considered to be tolerably correct. This being so, it is evident to what a small extent sub-soil drainage has been adopted in Prussia. The 214,000 acres of the larger proprietors and the 10,200 acres of the smaller proprietors form together a small portion of the probably drain-requiring surface. The usual depth is three to four feet:—

Subsoil drainage.

Subsoil Drainage.	No. of Owners.		Size of the Surface						Items of Cost of Subsoil Drainage.		
			To be Drained.			Already Drained.			Price per 1,000 Drains.	Cost of Digging and Laying per 4·12 yards.	Total cost, including Drain Pipes, Superintendence, &c., per Morgen.
	Larger.	Smaller.	Of larger Proprietors.	Of Smaller Proprietors.	Total.	Of larger Proprietors.	Of smaller Proprietors.	Total.			
	1.	2.	3.	4.	5.	6.	7.	8.	9.	10.	11.
			Morgen.	Morgen.	Morgen.	Morgen.	Morgen.	Morgen.	Thalers.	Sgr.	Thalers.
Prussia	56	21	24,216	655	24,871	6,950	311	7,261	1½ to 40	3 to 5	8 to 12
Pomerania	163	16	88,931	343	89,274	44,658	335	44,993	4 49	1½ 5	8 12
Posen	29	4	25,926	20	25,946	5,094	31	5,125	2 20	2 5	6 16
Brandenburg ..	149	54	42,600	762	43,362	22,708	94	23,402	3 50	1 6	5 15
Silesia	439	638	97,762	5,095	102,857	55,276	5,138	60,414	2 180	2½ 5	5 15
Saxony	296	905	31,697	4,859	36,556	35,131	7,644	42,775	2⅔ 60	2 5	8 20
Westphalia	79	346	6,024	2,975	8,999	5,563	4,315	9,878	3½ 20	2 5	6 14
Rhineland	53	953	4,266	881	5,147	2,632	2,409	5,041	3 35	1¼ 5	10 15
State	1,264	2,937	321,422	15,590	337,012	178,012	20,877	198,889	1½ to 180	2 to 5	8 to 15

Columns 10 and 11 are based upon the most frequently recurring mean price.
N.B.—It will be recollected that 3 morgen = 2 acres; a thaler = 3*s*; and a silbergroschen = 1¼*d*.

(*c.*)—*The Implements, Machines, and Movable Forces of Agriculture.*

31. This sub-division refers to an interesting subject, which must however be only cursorily considered. The importance of lightening the task of the cultivator cannot be

overrated. It must be acknowledged that England has taught to Prussian cultivators the wisdom of having special implements for each special purpose and of facilitating the task of the commonest manual labour by using the best working tools. That these principles are making their way in Prussia is manifested by the fact of the more frequent occurrence in German agricultural Exhibitions of home-made implements of simple and improved construction. Improvement of implements.

Within the territories now forming North Germany and the Prussian Provinces, two tilling instruments seem to have special domains. The plough (at first a wheel-plough) was distinctive of German land, and the hook-plough ("Haken") was distinctive of Slave land. The mechanical principle of the first seems to be the screw,—of the second the wedge. There were not a few varieties of each instrument. Both are represented at the present day,—the hook-plough in its most useful form as the Mecklenburg hook-plough ("Haken"). It has neither mould-board nor coulter, and the share is a pure share with a hook; or rather this kind of plough corresponds well to its Latin name in the middle ages "Uncus," in contradistinction to "Aratrum." Ancient ploughs.

32. In the province of Prussia the Grignon plough is used in the Vistula level, and the American swing-plough on the higher lands. The Prussian plough ("Zöche"), which is the variety of the hook-plough that approaches the nearest to the German plough, is peculiar to this province. The Lithuanian plough ("Stagutt"), which resembles in an improved combination the ancient varieties of the hook-plough, also belongs to this province, and in the hands of a clever ploughman has beaten many a modern plough both in loosening of the soil and economy of traction. Ploughs in Prussia.

In Pomerania the Regenwald plough, which combines the good qualities of the hook-plough and the usual plough, is peculiar to the province. Other ploughs are in use, but the hook-plough is still mainly used for fallow. In Posen, the Silesian hook-plough ("Ruhrhaken") and the Bohemian plough ("Ruchaldo") are almost universal. The Bohemian plough has the iron-mould board so placed that its edge and lower corner act as a share. In Brandenburg, the Mecklenburg hook-plough is still much used in the North, but elsewhere varieties of the Bohemian plough obtain. In Silesia, the Silesian hook-plough ("Ruhrhaken") is peculiar to the province. But varieties of the ordinary wheel-plough are also used. Large farming has adopted a few modern ploughs, chiefly the American sub-soil plough. In Saxony, about Magdeburg, the large farming has tried many a kind of hoe and foreign plough. The American ploughs for deep ploughing have held their ground. The three-shared plough is also in use on account of its economy of man power. Elsewhere the Bohemian plough has driven out the old Thuringian plough. In Westphalia there is little change since 1836; the customary wheel-plough is in use. Towards the Rhine the Cleves plough—a double-shared plough—is employed. The Grignon plough has latterly made most way for heavy land. In Rhineland the distinctive and so-called "Huns" plough, which is a swing-plough with a coulter and a peculiar share, is the customary, and a very advantageous implement. It is universal in the northern parts, but in the southern the hook-plough is used. The Nassau plough, a variety of the Bohemian plough, is also employed for heavy lands. As a general remark wooden ploughs are by no means extinct in the kingdom.

In Pomerania.

In Posen.

In Brandenburg.

In Silesia.

In Saxony.

In Westphalia.

In Rhineland.

33. The American ploughs have been more used than English, and no steam-ploughs are to be found in the State. Threshing machines, as also the so-called whim machines ("Göpelmaschinen") for threshing, are on the other hand widely spread, and reaping and especially mowing-machines have been adopted in some parts. In Saxony the yeomanry and peasants are trying to obtain them, and have formed associations for the purchase of such machines, chiefly threshing-machines. Threshing machines, &c.

34. The following figures will show the increased use of steam agricultural machines from 1846 to 1861, since which year they have not been counted, but have increased at a greater rate than before. These include machines for draining and irrigation. The greater part of them, however, are for threshing machines.

Machines.	In 1846.	In 1849.	In 1852.	In 1855.	In 1858.	In 1861.
Number	48	63	74	97	121	242
Horse-power ..	504	598	836	1,262	1,347	4,172

According to German prices, if the cost of steam-power be unity then that of horse-power is 2·2, and that of man-power is 36. For threshing the economy is yet greater.

Draft animals.

35. The following Table showing the use of draught animals is interesting:—

HORSES.

Years.	Prussia.	Pomerania.	Posen.	Brandenburg.	Silesia.	Saxony.	Westphalia.	Rhineland.	Kingdom.
1816	309,869	96,627	66,082	139,039	139,002	106,499	102,298	81,913	1,041,329
1822	367,010	101,463	78,066	145,941	142,105	115,502	107,819	88,705	1,145,611
1831	359,988	103,695	99,000	143,943	144,906	122,174	102,174	96,131	1,172,011
1840	356,483	110,763	119,610	156,033	156,403	124,587	104,385	107,112	1,235,376

Decrease ..	..	40,532	3,444	40,569	2,758	..	..	9,729	32,042

For every 100 there was of—

	Prussia.	Pomerania.	Posen.	Brandenburg.	Silesia.	Saxony.	Westphalia.	Rhineland.	Kingdom.
Horses—									
Increase ..	37·9	50 9	120·0	45·0	46·6	35·3	0·6	43·0	42·9
Oxen—									
Increase ..	30·3	..	..	..	..	13·6	27·1	..	..
Decrease ..	..	58·1	4·1	31·7	2·6	..	..	10·2	4·41

Thus the use of horses has increased 43 per cent. and that of oxen has decreased 4·41 per cent.

Increase of horses.

In Prussia, where horse-breeding is of importance, the number of horses and the number of oxen have increased one-third. In Westphalia the former number has been stationary, but the latter has increased. In Saxony the horses have increased by one-third, and the oxen by one-eighth. In Posen the number of horses has increased 120 per cent, but the number of oxen has only slightly decreased. For Silesia, Pomerania, Brandenburg, and Rhineland, the number of horses has on the average increased by 46 per cent., but the number of oxen has decreased in a very different ratio in each of these provinces. The decrease has been 10 per cent. in Rhineland, 32 per cent. in Brandenburg, and 58 per cent. in Pomerania since 1816. Here and there a road locomotive for agricultural or traction purposes is to be found. The use of steam-machines is increasing since the home manufacture has been so successful as to considerably cheapen them to the farmer.

Road locomotives rare.

(d.)—The Cultivation of Arable Land.

36. Reference having been made to the varying usefulness of the soil and to the employment of agricultural implements and machines, it is now necessary to examine briefly the cultivation of the chief varieties of cultivated land. This subject is one in which the defects of the existing statistics are much felt. In Prussia, as in many another country, the purely agricultural statistics are still wanting in accuracy and completeness. This subject will be treated in this subdivision province by province. In estimating the agricultural position of each province, its position in respect of physical conformation and of climate is to be borne in mind. These have been noticed in the preceding paragraphs 9 to 13. But allowance must also be made for the relative position of each province in respect of local quality of soil, a subject which could not be compressed into this report.

37. In Prussia the three following Tables give the chief points of interest:—

	Total Area.	Crop-bearing Area.				Tillage.		Extreme Districts.

NOTE.—The Net Return, forming the basis of the Land Tax, is naturally not the real Net Return: it is lower than the real Return. It may usually be trebled to obtain the real Net Return, and may sometimes be increased by seven times. In this and the corresponding Tables the Net Return is that of the Land Tax; and the morgen can be taken at two-thirds of an acre, the thaler at 3*s.*, and the silbergroschen at 1½*d.*

Agricultural position of Prussia.

The crop-bearing surface and the tillage approach very nearly to the average of the State, and the proportion in each division of the Table does not vary much from that average. East Prussia is however behind West Prussia, especially in respect of the low land. The district Labiau is the worst of all the districts of classification in the Kingdom. The climatic conditions render husbandry difficult in this Province, but quality of the soils is less disadvantagous in spite of their great local contrasts. The distinctive agricultural feature of the province is, that side by side with very fertile and rich districts are some of the least fertile and the poorest districts of the Kingdom. In East Prussia the larger properties depend usually upon sheep rearing. They have various shifts of crops. Rye,

Larger proprietors.

peas, buckwheat, and potatoes in various succession; also, where the soil permits, one year clover, as also fodder roots, and carrots. Wheat is little grown, barley scarcely at all. Peas are the most advantagous; buckwheats are less advantageous, and potatoes are only grown for the use of the house and the distilleries.

Smaller proprietors. The smaller proprietors still retain as a rule the three-field system. This system is usually winter grain crops, summer grain or forage crops, and then fallow. But they often let considerable portions of their land rest three and even six years after the summer crops. Many, however, only till an "infield," which they manure uninterruptedly, with winter or summer crops. Better farms have a fourth course of clover. The smaller proprietors also cultivate a little flax. In some districts the farming is better than this. The grazing farms are more advanced. In this part of the province there are also some districts of special varieties of cultivation.

Larger proprietors. West Prussia extends so far west, that the climatic conditions vary much on the left bank of the Vistula. The larger proprietors still look upon naked fallow as an absolute

Smaller proprietors. necessity. The smaller proprietors, with scarcely an exception, follow the three-field system with an entirely, or in a large portion, occupied fallow. Even where they possess better meadows, these proprietors are defective in their knowledge of manuring, and only those prosper who give more space to forage crops and the purely pasturage fallow.

Gross produce. The Table of gross produce per acre shows the enormous difference between various parts of the provinces, arising from physical conformation, climate, soil, and mode of farming.

Net return. The Table of the land-tax assessments shows that Prussia has an average nett return of only 25·3 silbergroschen, whereas that of the Kingdom is 45·6.

Of Pomerania. 38. Similar Tables will give the chief points of interest in connection with Pomerania:—

This province has a very considerable extent of tillage; Köslin approaches the average of the State, and Stralsund exceeds it largely. The climatic conditions of the high land are so disadvantageous that wheat and barley succeed only in well-sheltered situations, and even peas are endangered. The farming depends upon rye, oats, potatoes, and several years

Yeomen. of fodder-courses. The yeomen, who possess sometimes considerable tracts of tillage, have in several districts retained the three-field system with occupied fallow, but frequently they insert a course of clover before the fallow. Their manuring is very defective. The

large proprietors have more or less, since 1845 exchanged the three-field system for the system of shifts, which sets apart half to three-fifths of the surface to crops; the rest to pasturage and fallow. They practise six, seven and more courses, either winter fallow and manuring, followed by potatoes and peas; then summer crops and clover for cutting or depasturing; or, manuring for potatoes, followed by summer crops, several years of clover, and then an exhausting crop of rye; or by interchanging each succession. Manuring is not perfect, but much is done by subsoil drainage. Towards the sea-coast, the larger proprietors depend chiefly upon sheep rearing, and great attention is paid to manure. Dressings of marl are used with visible advantage. The rotation varies according to the manure at hand. Where there is much and the soil is a good rye soil, the rotation is—1, manured fallow; 2, rye; 3, oats; 4, manured, hoed crops; 5, barley; 6 and 7, clover to be eaten off. But, if there be less manure, then after the winter crop potatoes, then oats, lupines, and clover pasturage in six or seven years succession. The smaller farmers have generally abandoned the three-field system. They adopt if possible an interchange of grain and green crops, and on very small and light lands an interchange of only manured potatoes and rye. There are "parcels" which have grown potatoes for twenty years, but which are, however, manured, and receive dressings of bog earth. On the sea-coast wheat preponderates. The large properties have a seven to eight course of shifts with two manurings; as, for example,—1, fallow; 2, manured turnips; 3, wheat; 4, barley; 5, half potatoes, half peas, manured; 6, half summer crops, half winter crops; 7 and 8, clover. On the other hand, the smaller farmers seem to retain the three-field system with a clover course inserted, which is depastured by cattle. Another custom is—1, manured fallow; 2, winter crops; 3, red clover; 4, winter crops; 5, summer crops partially with peas.

Large proprietors. Smaller proprietors. Larger proprietors. Smaller proprietors.

In the provincial district of Stettin the southern part has many advantages over the coast. Oil crops are raised. Corn, especially winter crops, is very safe. Rye and barley are well reputed. Both large and small farms seem to be in an advanced position. The succession of crops is distinguished by clover for cutting and depasturing, and the raising of herbage. Pure fallow is rare. Where a modified three-field system exists, the smaller proprietors raise tobacco and peas in the fallow field; barley, oats, and potatoes in the summer field. The larger farms have a large variety of shifts of crops from 4 to 13 courses. A common rotation is,—1, fallow; 2, wheat; 3, peas; 4, rye; 5, potatoes; 6, barley; 7, clover for cutting; 8, same, and for depasturing; 9, pasturage and fallow; 10, rye; 11, oats. Forage crops are very frequent, and the raising of fodder for stall-feeding only is not rare. On the coast, owing to the less favourable conditions, the large farms have generally only two-fifths of the land under crops, and fallow is seldom omitted. The smaller farms are still chiefly subject to the three-field system, but four courses of clover sometimes precede the summer crops. The fallow is often half depastured. They have little manure, and substitute three, four, or even five workings with plough and harrow.

Smaller proprietors. Larger proprietors. Larger farms. Smaller farms.

In the provincial district of Stralsund the farming is necessarily directed mainly to forage crops. Fallow, which however is not required by the soil or want of labour, is usually deemed necessary. But upon many estates the fallow is interrupted by roots, maize, tares, or lupines, to be eaten off, and in autumn prepared again with winter crops. The potato distilleries have disappeared. The dominant system on the large farms is the Mecklenburg seven-year shift of 1, manured fallow; 2, winter crops, now and then partially with roots; 3, barley, and after roots winter crops; 4, peas, tares, potatoes, roots, flax, entirely or partially manured; 5, oats and rye with clover; 6 and 7, clover fallow. If the manure is defective, this series is changed at some of the stages. Hoed crops are seldom raised, owing to want of labour. The yeomen and peasants have nearly everywhere abandoned the three-field system for a similar seven-year shift. The farming on the estates of the Greifswald University will be elsewhere specially mentioned.* In general the smaller farms have too small forage crops, and consequently, by the underfeeding of the cattle, too little manure. Since 1830 dressings of marl are often used. Subsoil drainage has been much adopted with great advantage.

Large farms. Yeomen and peasants.

The table of gross produce shows how unfavourably situated the highest land in Köslin is. It has been calculated that, according to the easting and the distance from the coast at Kammin, the climatic conditions cause a disadvantage of 6, 15, 23, and on the West Prussia boundary even 31 per cent. Changing of seed, especially for rye, is much required. New Prussian flax seed has been strikingly successful.

Gross produce.

The Table of the nett returns shows in remarkable contrast Köslin and Stralsund, the latter having a nett return the triple of that of Köslin.

Nett returns

* When this part of the Report was written it was intended to notice the farming, if it offered anything worthy of special attention, of these estates in the account of the leasing of them. But as they have latterly been leased to the highest bidder, like other estates, the separate account has not been required.

Of Posen.

39. The province of Posen furnishes the following three Tables :—

	Total Area.	Crop-bearing Area.				Tillage.		Extreme Districts.

Kingdom	45·8	44	11	214	420	37	48	6	

In this province the crop-bearing area and the tillage area are both in greater proportion than in the Kingdom, and the poorest departments have not less than 35 and 42 per cent. of the crop-bearing area

Larger farms. The provincial district of Bromberg is less favourably situated than that of Posen. The larger farms are in considerable number, and have a system of cultivation consisting of

Smaller farms. various courses with numerous shifts of crops. The smaller farms on the other hand retain generally the three-field system with a fallow partially occupied. When meadows and pasturages fail, the farming makes no progress.

Large estates. In the provincial district of Posen the usually large estates peculiar to it are specially adapted for the system of cultivation followed in the district. There are various rotations of crops. Manuring is, however, seldom every four but every six years. Lupines are ploughed in, and dressings of gypsum are applied to clover. Guano showed itself in a long succession of dry years insufficiently powerful, and some attention has been directed to

Smaller farms. marl. The smaller farms retain for the most part the three-field system, with fallow entirely or partially depastured. Potatoes, roots, cabbages, tobacco, and flax, are raised in the fallow field. In one district there is a two-field system of, 1, potatoes; 2, rye; the sandy soil being slightly manured every three or six years, and large pasturages belonging to the farm.

Gross produce. Net returns. The Table of gross produce shows an average yield, and the Table of net returns shows a per-centage, considerably below the average of the State.

40. The three corresponding Tables for Brandenburg are as follows :—

	Total Area.	Crop-bearing Area.				Tillage		Extreme Districts.
		Area.	Of Total Area.	In Classification Districts.		Area.	Of Total Area.

In the lowlands the average tillage is very high. In the other parts of the province it is nowhere a third of the area. Of every 1,000 acres 475 are crop-bearing. Climatically, this province is as favourably situated as any other province of the State. The predominant sandy soil is not always disadvantageous. Its suitableness under favourable local circumstances of manure for clover has given rise to the so-called farming of the margraviate of six to ten shifts with two-year clover for mowing and depasturing, which has spread itself throughout all parts of the province for half a century. Along the Oder and Warthe the influence of the dykes begun in the time of Frederic the Great has been most important. Grazing, farming, and rotation of crops have driven out the old system of cultivation. Now the succession is, for instance—1, roots or potatoes manured; 2, barley; 3, rye; 4, clover; 5, half roots, half rape, or caraway, manured; 6, wheat; 7, oats.

Large farms.

Great attention is paid to the suitableness of the rotation to the soil. In other parts of the Frankfort district the large farms have shifts of two winter crops, two summer crops, and three clover crops, one of the latter being shared with half rape, potatoes or peas. Special mention must be made of the efforts to bring thin lands into good tilth, partly by lupines and partly by grass seeds. There exists an herbage cultivation, which, in opposition to the existing system, was instituted by the Agricultural Counsellor Fleck. It consists in using, in connection with dressings of marl and with hoed crops, suitable seeds for strengthening the light soils. Upon the better soils the succession is—1, grass for hay; 2, grass for depasturing or seeds; 3, rye; 4, hoed crop manured; 5, pulse crops; 6, rye; 7, hoed crop manured; 8, summer crops with clover and grass sown. The grass seeds are so selected and used that they vegetate early, middle, and late, and that tall and wide-spreading grasses together cover up the ground.

Small farms.

The small farms usually have a modified three-field system with occupied fallow. Pure fallow is rare. In Lausitz and the Spree forests spade cultivation has extended even beyond the limits of the lands of towns. There is, of course, much kitchen gardening.

Gross produce.

The Table of gross produce warrants the reputation of the cereals of the new margraviate. It is generally customary to cut the corn before the full ripeness. In the Havelland district the corn has been cut in the yellow ripeness in modern times in order to get a larger quantity of flour. Potatoes are a chief crop of the margraviate. Forage crops are abundant.

Nett returns.

The Table of nett returns shows that the province is considerably below the average.

The husbandry proportion of Silesia is rather higher than that of the State; 56·1 per cent. of the area is crop-bearing, and of this 54 per cent. is tillage.

The Breslau provincial district is particularly rich, having 64·4 per cent. and 61·8 per cent. respectively. In Upper Silesia farming is more difficult, according to the easting. On the little fertile right bank of the Oder the larger properties belong to large landed proprietors who want neither means nor intelligence to farm with skill. They depend chiefly upon high-bred sheep rearing; but from various reasons arising out of the unfavourable position of this part of the province a complicated and not easily carried out system of rotation is required. The four-field system is usually the basis of it. Thus—1, winter crops; 2, hoed crops; 3, summer crops; 4, clover for depasturing or mowing; or, 1, rape, hoed crops, forage crops; 2, winter crops and summer crops; 3, summer crops and clover; 4, sheep pasturing and oats. A modified three-field shift also occurs. The chief crop is potatoes, and numerous distilleries exist. Flax is also considerably grown.

Larger farms.

Smallest farms.

The smallest farms are considerably behindhand. The three-field system with dressed ("bebauter") fallow is predominant, and the rotation is such as—1, winter crops; 2, summer crops; 3, potatoes on sandy soil. Forage growing or fallow pasturage is generally deemed useless or impossible by the short-sighted cultivator! Winter crops twice in succession is not unfrequent, followed by a little manuring for buckwheat, and then afterwards sowing some rye! Stall fodder is almost unknown. The cattle are miserably fed on broad open pastures, stubble fields, roads, and the village common land.

Large owners.

The left bank of the Oder is not so ill-favoured. The large proprietors giving a prominent place to rape, have rotations such as the following:—1, beet-root or potatoes, manured; 2, summer wheat or barley with clover sown in between; 3, clover for mowing or depasturing, or for running to seed; 4, highly manured fallow for rape; 5, rape; 6, winter crops (chiefly wheat); 7, summer crops, as vetches, peas, carrots, maize or millet for forage, also potatoes; 8, rye or summer crops.

The smaller farmers of the left bank follow, as a rule, a modified three-field system with occupied fallow and not unfrequently cultivate rape. A shift of clover is also inserted as a fourth field. Their farming is for the less favourable soils too exhaustive, whilst manure is not understood and the cattle are underfed. But stall-feeding is gaining way. Smaller farmers.

In the provincial district of Breslau the numerous large properties have a rotation system of seven, twelve, or more courses which has widely diverged from the old three field system. Sheep breeding or cattle breeding, or beet-root growing are the main stay of the agriculturists, according to the soil. An example of rotation is—1, rape; 2, winter crops; 3, summer crops; 4, clover; 5, winter crops; 6, potatoes; 7, summer crops; 8, sheep pasturing. Large properties.

The smaller properties employ the three-field system with entirely occupied fallow, except of course in the cases where their cultivation is garden cultivation. The middle properties employ a similar system, with a forage crop inserted. But the smaller farms have adopted stall feeding. Smaller owners.

In the provincial district of Liegnitz the larger properties show no essential deviations from the cultivation of middle Silesia. The smaller farms have usually rye, barley, oats, potatoes, clover, and fallow for their shifts. In the latter they also grow flax, roots, white clover, and the like. Here and there they cultivate rape. In the garden properties a variety of plants are cultivated. Larger properties. Smaller farms.

All cereals are cultivated even in little fertile parts of the province. Oil crops are a chief product of the agriculture. The use of chalk dressings on certain very thin soils seems to be generally understood. The cultivation of potatoes has been a turning-point in the agricultural development of Silesia. The distilleries are very numerous. Flax is largely grown, but only very partially by the smaller cultivators. Liegnitz is famous for its kitchen gardening. The Table of gross produce shows the absolute yield of the chief crops. The Table of nett returns shows that Silesia has an average 10 per cent. above that of the State. Before noticing examples of the agriculture of the remaining provinces it is necessary to state that in the foregoing paragraphs the provinces of Prussia, Posen, and Silesia have been more slightly noticed than they deserve, because a separate report upon several points in them is in preparation by Mr. Consul White of Dantzic. Gross produce. Nett Returns.

Saxony has on the north-east a flat and predominating sandy alluvial land, on the south-west the hilly land rising to 3,000 feet of the Brocken and the Thuringia forest. These two divisions occupy each a half of the province. The alluvial land has a proportion of tillage and crop bearing surface equal to the average of the State. The hilly land exceeds it largely. Out of every 1,000 acres 612 are prepared for crops, and of these 591 for tillage. As regards farming, the sandy north-east resembles much the province of Brandenburg, and the south-western mountain land is for many reasons unsuitable to large farms, minutely subdivided, and chiefly under garden cultivation. Between the two a broad band of exceedingly fertile land lies along the foot of the

Large farming.

mountains. The large farming is established upon it and is supported by the great industry of beet-root sugar, which has attained to the most valuable development. This has occurred without driving out the small farming which the climate favours, and the wants of the industrial population support.

Large properties.

In the northern part of the provincial district of Magdeburg the large properties have always a rotation of crops which, in conjuncture with distilling is directed to stall-feeding, by extensive hoed crops or by preference to sheep rearing. The better soils are worked by corn, oil crops, and hoed crops, with several courses of pasturage and fallow; the higher and lighter soils with rye, potatoes, lupines, and sheep pasturing. On such soils white and yellow lupines are very widely spread both for forage and for sub-manure. According to the varying quality of the soil this system varies.

Smaller farms.

The smaller farms retain as a rule the three-field system. In the low lands, however, they are often liberated from the system and farm rather high. On the left of the Elbe they are passing over to a four-field system, with sowing of pasturing grasses. On bad soils of high land the one-field system predominates. As much rye is yearly sown as the time will admit. Whatever tillage remains unsown is in spring filled with oats or potatoes. The land is annually though sparingly manured. There are tillage lands, in which from time immemorial rye and nothing but rye has been cutivated. For boggy land the usual cultivation is by burning the sods, ploughing the clay soil and the sandy sub-soil together, and then, by dressing the surface with turf ashes to prepare the land; and is to sow oil crops, then rye or oats, or according to circumstances hoed crops; and, for re-turfing, corn with clover or Timothy grass (*Phleum pratense*).

In the south portion of the provincial district of Magdeburg the employment of large circulating capital, the number of cattle and draught animals kept, the deep and equal work effected by improved implements and machines, the introduction of considerable quantities of artificial manure have raised the cultivation to a high standard and increased to a large degree the returns of tillage. But everything, even with the small farms, is secondary to the beetroots for the sugar manufacture. The cultivation, as regards the purposes of this report, need not therefore be given in detail.*

Larger properties.

On the alluvial land of the provincial district of Merseburg the larger properties have also a rotation of crops with stall-feeding. If rape be grown, the rotation is, for instance 1, fallow; 2, oil crops highly manured; 3, winter crops; 4, hoed crops; 5, barley or oats; 6, clover or, on the high lands, lupines; 7, winter crops slightly manured; 8, summer crops

Smaller properties.

carried away. The smaller properties have almost unreservedly retained the three-field system with occupied fallow or employ a not more advantageous system of farming. Stall-feeding is everywhere practised, and especial importance is attached to the keeping of horned cattle. The sugar industry influences the cultivation along the foot of the hills.

* Vide, however, a short description of the beet-farming in paragraph 48 of Part V.

In the provincial district of Erfurt a considerable portion of the rural districts are not yet freed from the rights of common, and are still subject to the field compulsion ("Flurzwang") even where it is out of date, because there is no accessibility under the minute subdivision and intersection of land. Consequently, the properties are as a rule farmed on the three-field system with fallow before rye, or forage crop before wheat. There are also four-field farms—1, potatoes; 2, summer corn with clover; 3, clover; 4, winter crops. There are several varieties of such four courses of shift. Where it has been practicable, a many course rotation has been adopted. Around Erfurt itself numerous commercial plants are grown in the fallow. Erfurt is famous for its gardening of such plants and vegetables. On the high ground the fallow is almost always naked, or only exceptionally used for clover or potatoes. The quite small farmers in the mountains who possess too little land from which to feed their families, have a two-year shift of potatoes and rye; and the smaller cultivators, chiefly the inhabitants of forest villages cultivate, in alternate years, only potatoes. Whenever forest and mountain pasturages fail, stall-feeding is the rule.

This Province grows cereals in excess. The importance of beetroot has been noticed. Potatoes have not been much subject to the disease, and the so-called green or Heiligenstadt potato has been very successful. Forage roots are wide spread, and not only the roots but the leaves after preparation are given to milch cows. Lupines are much esteemed. Clover is well known; sainfoin is grown in chalk soils. Lucerne is universal in the Magdeberg district Some others are grown. Of the commercial plants, flax has some importance, and chicory is of great importance. But the cultivation of seeds is of the most importance, and belongs in great part to farming as apart from gardening. Erfurt as has been already noticed, is the centre of this agricultural industry and has been so from ancient times. The district has now widened very considerably westwards and northwards.

Gross produce. Nett Returns.

The Tables of gross produce and of nett returns show in striking contrast the inferiority of the alluvial land and the superiority of the hilly land, The difference would be still greater if the Eichsfeld and two other departments having an elevated and less fertile position, were omitted from the hill land.

The styles of farming in various parts of this province are manifold, not *only on* account of the contrasts of physical conformation and of soil, but also on account of the peculiarity of the farming in common of so called "Vöhde" and so called "Esche," so that from very olden times only a very small area of tillage has been cut up and subjected to field compulsion in the Münster plain, and the greater part of the provincial district of Münster. Thus the provincial district of Münster has an almost entirely free farming. The properties are generally of medium size; the tillage forms no high proportion of the area. In some parts the soil is such that particular rotations of crops cannot easily be carried out. Moreover, stagnant moisture and late spring frosts interfere with many years of shift of crops. A one- and a two-field system seem to have obtained from ancient times, which, not being subject to field compulsion, could easily be converted into any form of farming. In the Ems territory the sandy soil is often made to grow rye crop after rye crop, which is only now and then and generally in undetermined years exchanged for buck wheat or potatoes. The strength of the land is maintained by the annual sod-manuring* of long-standing custom, which visibly improves the tillages with its sand and mould. Thus large districts, which under careless treatment would become wastes, are kept fertile. It is now sought to extinguish the right of sod cutting in the woods, &c., by a commutation of the existing rights, and by a substitution of marl dressings. On the lower soils sod-manuring is, as a rule, used every other year; and by a continuous succession of winter crops and summer crops, straw crops are almost exclusively raised. Without sod-manuring the succession passes from 1, rye; 2, rye: 3, oats or buck wheat, through 4, 5, 6, and 7, pasturage into grazing farming, which has always been a chief feature of the farming of the "Vöhde" and "Esche." On heavy clay soils a fixed six-field system of, for instance, 1, rye; 2, wheat; 3, barley; 4, clover; 5, wheat; 6, oats, is used. The pasturage of horned cattle is universal.

In the provincial district of Minden the three-field system is predominant in certain parts, the fallow being occupied in summer in the more favourable positions, but being bare in the less favourable positions. North-west in the Weser valley, a four field system of 1, naked fallow; 2, winter rye or wheat; 3, barley or oats; 4, oats; crops for dry fodder or potatoes, which by an inserted course of pulse crops becomes a five-field system in some places. The larger properties rely chiefly on sheep rearing. The five-field system, with a variety of succession of crops obtains in the west of the district. But on the marshy lands an interchange of two winter crops and three clover, and the like in the fallow is customary.

Larger properties.

In the provincial district of Arnsberg, the rotation of crops is general, so far as regards the so-called five fertile departments of the Haarstrang Hills. It is practised as a three- or six-field course, with high manuring. Modified three-field systems are also in use. On loamy sand soils the succession of 1, potatoes; 2, rye; 3, oats, without fallow is frequent. Pure fallow is only partially retained on the higher land, and chiefly before rape. In the Soest borders, on the other hand, where fallow had fallen into disuse, it has again become the rule, about every fifth year, for the high manuring which was substituted for it is said to have caused weeds to get the upper hand, and the corn produce to lessen. In the nine departments of high mountain land there are few favourable tracts of land. Forest cultivation and low farming in a few small districts exist side by side. There is, for instance, an eighteen-year course, called "Hauberg" farming, in which rye is once sown amongst the tree-roots. Elsewhere on moors rye or oats are sown two years in succession out of

Farming in the forests.

* The sods are heather sods, containing the roots. Vide paragraph at end of subdivision *b* of division B of Part V, for information, subsequently acquired, which turns these *present* tenses into long *past* tenses.

ten or twenty. Here, too, the in-field and out-field system of the "Countryman's Rudiments" exists. But in other parts the three-field system, with various modifications, obtains; and lastly, in one or two districts, this passes into the five field, and becomes in Siegen a rather better system with five to seven shifts.

Gross produce.

As regards the Table of gross produce it may be remarked that wheat, formerly restricted to the clay soils of the Münster district, to the Haarstrang and Hellweg districts, has within the last decade extended itself successfully to the sand soils of the western part of the province. The chief crop varies from wheat to roots and the chief forage crop is red clover.

Nett Returns.

As regards the Table of nett returns the province is very considerably above the average of the State. The Minden district is about the average, and with the exception of the five fertile departments of the Haarstrang, of which the high average far more than counterbalances their low average, all other districts are below the average. The contrast is enormous. Wittgenstein has an average of only 18 silbergroschen, whereas in Soest the average runs to 115 silbergroschen.

Of Rhineland.

44. Lastly, the Rhine Province, offers for comparison with other provinces and for appreciation of its agricultural importance, the points of interest set forth in the following three Tables:—

	Total Area.	Crop-bearing Area.				Tillage.		Extreme Districts.

A distinction has been drawn between the northern and the southern division, for in this province more than in probably any other the geological character, which has caused a sharply defined contrast between its component parts, causes the great contrast in its agricultural conditions. In other provinces the contrast has been between mountain and plain, in this it is between the bare Graywacke mountains of the larger southern division and the fertile, partly mountain, partly alluvial, land of the smaller northern division. The

characteristic of the husbandry of the province is the minute subdivision of the area of tillage and garden land. Consequently spade husbandry extends over a considerable portion of the moderate proportion of tilled land in the province.

In the provincial district of Düsseldorf a free system of farming with a course of pasturage for one or more years obtains universally on the fertile plains and low lands The pasturage land is one-fourth to one-third of the tillage. There is no unchangeable rotation of crops, but the following are examples for heavy and light land respectively. For heavy land—1, fallow; 2, rape; 3, wheat; 4, rye; 5, clover; 6, oats; 7, turnips or potatoes; 8, wheat; and for light land—1, clover; 2, rye; 3, oats; 4, potatoes; 5, rye; 6, buckwheat; 7, oats. The manuring is high. Wheat and clover are grown on sandy soils where the success under other conditions would be scarcely possible. The rape crops are not so good as formerly. As regards the higher lands, the larger properties follow generally the rotation—1, clover; 2, oats and barley; 3, potatoes and turnips; 4, wheat; 5, rye, and spring turnips; 6, buckwheat and potatoes; 7, rye or wheat. Stall-feeding is every where introduced. In one department the three-field, or a scarcely better system is retained.

Larger farms.

In the provincial district of Cologne the predominant cultivation on the plain is garden cultivation. Around Cologne and Bonn, commercial crops and vegetables and some beetroots are raised. On the larger properties the succession, for example, is—1, early potatoes and rye for fodder, with heavy manuring; 2, winter barley; 3, wheat or rye with clover after fresh manuring; 4, clover; 5, oats; 6, winter crops, rye or wheat, turnips being sown in the stubble. On smaller properties the succession often is—1, winter cereals; 2, winter crops with clover; 3, clover; 4, winter crops, with turnips in the stubble; 5, oats. It is nearly everywhere practicable to follow a cereal with another crop in the stubble. On the outlying elevated land of the mountains the soil is very variable. The farming is said to be very high ("sehr intensive") and manuring is used to nearly every crop. Fallow occurs, however, on the better soils every ninth or twelfth year, and on the worse soils, every fourth year in order to extirpate the weeds. As a rule the cereals exceed two-thirds of the area farmed, and the winter crops occupy about one-half of this. In the departments amongst the hills the more intensified farming occurs only in the valleys. Much land is left for grazing. Elsewhere the three-field system mostly remains. This is not only caused by the unnatural difficulty of inaccessibility in consequence of the subdivision of lands in each district. In some places a barbarous cultivation obtains such as of oats after oats, and rye after rye, till the land is exhausted. The more intelligent cultivators, however, are seeking to follow a scientific rotation and to adopt clover crops, so far as climate and soil will admit.

Larger properties.

Smaller farms.

The provincial district of Aix-la-Chapelle is similar to that of Cologne. On the plain and along the slope of the Eifel the husbandry is very intensified. In some districts, however, the farming is quite different, for in them the greater portion of tillage lies fallow eight to ten years, is then prepared for cropping, bears rye and then oats twice or thrice running, and then returns to fallow. Where the soil is rather better, another crop, potatoes or other, is introduced. On distant properties, where manure entirely fails, the soil is prepared by burning and the rye is sown, and after oats in the second year the soil is exhausted and must rest for twelve or twenty or more years. Small "parcels" grow potatoes and oats. Stall-feeding forms only isolated exceptions.

The provincial district of Coblentz is entirely within the unfavourable southern division. The moorland ("Schiffelland") occupies an extended space, so that only the narrow valleys remain for regular cultivation. Here the associations for cultivation in common occur frequently. The stump cultivation ("Rottban") and the bark-cutting ("Lohhecken") appear to be a vital condition for the middle and less-monied classes of the population. The succession of the cultivation takes place in fifteen years. For twelve years wood is grown, then the wood is cut down to the stumps, and then three years of crops follow this—1, rye; 2, potatoes; 3, oats, some barley, summer rape, and the like. On worse soils, only one crop of oats or rye can be raised. The tilling labour is exceedingly hard, and can as a rule be carried out only by manual labour. The lands in constant tillage are usually subject to a three-field system with forage crops in the fallow field, rye-wheat or spelt-wheat in the winter field, and chiefly oats in the summer field; and occasionally two-, four-, or five-field system. In several places the Palatinate two-field system of corn, alternately with vegetables and hoed crops, obtains. In this southern division of the provincial district the right of stubble grazing is widely spread, and that of grazing extends throughout all seasons even in the meadows. Local custom and tradition have fixed a code, so to speak, of bye laws for its due regulation. In Wetzlar the three-field system with field compulsion is universal. In the meadows along the Rhine there is, on the contrary, a rotation of crops supported by high manuring.

The provincial district of Treves is similar to the preceding. Here, too, the associa-

tions, as well as the communalties, utilize the land in common. Here, too, the wide reaching right of stubble grazing recurs. Here, too, the numberless "parcels" without accommodation ways enforce the three-field farming of tradition, which in consequence of the extensive forest grazing lands is not so prejudicial, as it might be. There are even communalties endeavouring to re-introduce the common of sheep grazing. Where compactness and accessibility admit, a rotation of crops has been adopted. An example on the Treves low land is—1, barley; 2, rye; and spring turnips; 3, potatoes; 4, barley; 5, rye; 6, clover; 7, barley; 8, rye and spring turnips; 9, potatoes, with heavy manuring in first and fourth, and half manuring in third, seventh, and ninth shift. On the chalk hills of Saarlouis, the greater farms use—1, wheat (little rye) with 160 to 200 cwt. of shed manure; 2, barley, or mixed oats and barley; 3, two-thirds fallow, one-third potatoes; 4, pulse crops and clover. But the greater portion of the valley lowlands and of the fertile soils are utilized in small "parcels" by garden cultivation. Larger farms.

The Table of gross produce corresponds to what one would expect to find under the agricultural conditions as compared with other provinces. The Table of nett returns shows the contrast between the northern and southern divisions most distinctly. Gross produce. Nett returns.

45. The tillage conditions of each province having been thus rapidly regarded, the following Tables for purposes of comparison are inserted also from Dr. Meitzen's book :— General comparison.

The Larger Proprietors have—	The Smaller Proprietors have—
In East Prussia:—	
Rotation (4). Manuring defective. Fallow, seldom naked.	Three-field system. Manuring defective. Fallow, naked.
Rotation various. Manuring low. Fallow, naked, or occupied.	Three-field system. Manuring low. Fallow, naked, or occupied.
In Pomerania:—	
Rotation (6 or 7). Manuring low or medium. Fallow, rarely naked.	Three-field, or rotation (4 or more). Manuring defective or low. Fallow, usually occupied.
In Posen:—	
Rotation (various). Manuring low or medium. Fallow, occupied.	Three-field or rotation. Manuring low. Fallow, partly or entirely occupied.
In Brandenburg:—	
Rotation (4 to 6). Manuring low. Fallow, occupied or none.	Modified three-field. Manuring low. Fallow, occupied.
In Silesia:—	
Rotation (4 or more). Manuring low or medium. Fallow, seldom naked.	Three-field or modified, or rotation. Manuring defective. Fallow, dressed, or occupied.
In Saxony:—	
Rotation (various) with advanced farming. Manuring medium or high. Fallow, none, or occupied.	Three to five-field system, and rotation. Manuring medium. Fallow, usually occupied, or pasturage.
In Westphalia:—	
Rotation (various or free). Manuring medium. Fallow occupied, or pasturage.	Three to five-field system. Manuring medium. Fallow usually occupied, or pasturage.
In Rhineland:—	
Rotation (various or free). Manuring low or medium, or high. Fallow seldom, and occupied.	Three-field or free. Manuring low or medium, or high. Fallow, occupied, or none.

Wherever the so-called garden-cultivation occurs, it is in an advanced state, whether it is practised in large or small properties, with plough or spade. In the preceding statement the endeavour has been to give the prevailing characteristics of the husbandry of each class of proprietors. Thus, in West Prussia there are many smaller proprietors, who have advanced far beyond the three-field system. Details of this kind must be sought out in the preceding paragraphs, where, so far as time and space have permitted, they are given. With regard to ploughing and stall-feeding no comparison could be made, because the former is seldom deep ploughing, and the latter is in about the same condition both on the larger and smaller properties. It has been impossible to institute any general comparison between proprietors and tenants. But, except perhaps in the case of large tenants, there seems to be no general appreciable difference between their cultivation and that of proprietors of holdings of a similar size. The tenant is very seldom (as regards small holdings) a tenant in order to use his capital as circulating capital, but usually a tenant because he has no capital with which to buy a farm.

(*e*).—*Meadows and Pasturages.*

47. In order to complete the outline of the agricultural state of Prussia, it is necessary to add to the foregoing Tables and paragraphs some Tables and remarks upon the meadows and pasturages of the Kingdom. The cultivation of meadows has been especially studied in Prussia. The Siegen system of irrigation, already referred to in this report, has become famous. The Petersen system of meadow cultivation has, in more recent times, attracted much notice. This rests upon the idea that a meadow should not only be watered on the surface, but should be moistened from below by water, manured or not, in drains. The super-irrigation can be left out and only the sub-irrigation used. The apparatus of drain-pipes, &c., is in this Kingdom laid down for about 8 guineas per acre. A third system, the St. Paul system, acts without any irrigation at all. It is solely carried out by compost manure, and has had very good results on deficiently watered estates. Every fourth year a good compost earth is harrowed into the meadows in spring and some new grass seed sown. For boggy lands there is a special system called the damming cultivation. Pasturages receive only exceptionally any attention as to cultivation. Moreover, in a considerable number of districts where the separation of commons has taken place, and where the advantages and applicability of stall-feeding have commanded assent, the broad, open pasturages have dwindled down to insignificant sizes. Where they still exist, they are either of very moderate quality or are unfavourably situated as to climate. **Modes of scientific irrigation.**

48. The distribution of meadows and pasturages, as well as the other chief points of interest, can be seen in the following Table:— **Distribution of meadows, &c.**

	Area of		Proportion to Total Area.			Extreme Per-centages in Classification Districts.						Average Nett Return per Morgen.			Average Nett Return of Extreme Classification Districts.

NOTE 1.—To convert morgen into acres deduct one-third of the number from the number of morgen.
NOTE 2.—To find net return per acre, add one-half to the number of silbergroschen, and to the added amount add again a-half of the added amount. The total will be the nett return per acre—approximatively.
NOTE 3.—A silbergroschen is equal to 1½*d*.

In the Province of Prussia the grass land is in considerably greater quantity than the average of the State. But the small nett returns, excluding the lowlands, show that, in spite of the large extent of area, the produce is small. The average price of hay, taking a term of twenty-four years from 1837 to 1860, was, per 120 lbs., 15·4 silbergroschen in Konigsberg, 18·5 silbergroschen in Gumbinnen, and 23·3 silbergroschen in Dantzig Provincial District. The agricultural value for 120 lbs. of middle hay, was, therefore, much higher than the price of the land tax assessment. A similar difference would be found in regard to other provinces, but it will not be necessary to give these prices in detail. In Prussia.

In Pomerania the grass land is slightly above the average of the Kingdom; but, compared with Prussia, its area does not contain any such a large proportion of meadows and pasturages; and in the better cultivated district of Stralsund the pasturages are only 5 per cent. of the area. In Pomerania.

In Posen the grass land is much less than the average. Posen.

In Brandenburg it formed formerly the bulk of the province; but since the land improvements have reclaimed so much land for tillage and meadows, it has now become for pasturages only 4·6 per cent., and for meadows 10·2 per cent. of the area. Brandenburg.

In Silesia the pasturages have, since the separation of commons, been much diminished; the meadows have the average of the State, but the distribution is not so equal that all localities are provided with hay. Silesia.

In Saxony the grass land, which is chiefly on the alluvial soils, has the average of the State. Saxony.

In Westphalia the pasturages occupy a far higher proportion of the area than in any other province, and the meadows a proportion equal to the average of the State. Westphalia.

In Rhineland the distinction between meadows and pasturages can be less easily made than in some other parts. Together they have a proportion of the area equal to the average of the State. Rhineland.

49. The following Table showing the produce of meadows and the cattle-feeding power of pasturages will also be interesting:— Produce of meadows, &c.

One head of cattle of cattle is taken to mean also two-thirds of a horse, ten sheep, four pigs, or twelve goats. Its annual fodder has been estimated at 5,520 lbs. of hay or the equivalent of hay. Thus one-fifth of the required fodder seems to be provided by meadows and pasturages. From another source it can be estimated that the grass-land only furnishes one-fifth of the fodder required, so that although the above figures cannot be taken to be quite accurate, there is no improbability in them.

(*f.*)—*Cattle Breeding and Rearing, &c.*

50. Under this head it is intended mainly to treat in a cursory manner of breeding and rearing, so far as they form part of ordinary farming, and, therefore, are correspondent to the questions of Lord Clarendon's Circular bearing upon this part of farming.

In Prussia, as has already been incidentally noticed, sheep rearing was a monopoly. The object was, in the first instance, to promote sheep-farming; but the result was subsequently to cause several prejudicial restrictions on the development of agriculture. Horned cattle do not seem to have been the involuntary cause of any such prejudice. The only point which needs mention here, as belonging to the history of this subject, is that Albert Thaer advocated in his book of "English Farming" an improved use of cattle in farming. But meat was not at a sufficiently high price to give assistance to his theory or his own experiments. It is impossible now to give space to the numerous other practical or chemical agriculturalists who have contributed in Prussia to the present condition of cattle and sheep rearing, and especially to the theory and practice of dry fodder and of stall-feeding.

51. The following Table will give the cattle of all kinds counted in 1864:— Number of cattle.

Counted on December 3, 1864.

	Horses.	Horned Cattle.		Sheep.	Swine.	Goats.	Reduced to Head of Cattle in general.

Westphalia	1816	342	1,195	949	938	390	76	1,906	2,909
	1867	340	1,566	1,009	1,731	944	435	2,449	4,651
Rhineland	1816	194	1,252	742	1,099	401	85	1,761	3,884
	1867	300	2,037	1,180	1,145	936	455	2,711	7,075
Kingdom	1816	244	789	423	1,625	294	29	1,395	2,084
	1867	375	1,192	731	3,765	758	209	2,268	3,531
Per cent. of increase .	50 years	54	51	73	132	158	621	63	70

Thus the increase of cattle in general has been less by a tenth than the increase of population.

Horses.

52. Of horse breeding no notice is required except to record that it is of great importance to the army, and consequently a subject which causes high authorities much anxiety, for since the disappearance of pasturages in many parts of several provinces horse breeding has a matter of course declined.

Oxen.

53. Of cattle breeding and rearing, in the the narrower sense of the term, a notice is required. But no inquiry into races and manner of breeding is requisite. The breeding has improved since 1830. A Bavarian race, with powerful build, is frequently to be found where work is required. The Dutch race is not unfrequent for breeding. Generally, it may be stated that nearly every part of the Kingdom can supply itself on the spot or from the immediate neighbourhood with all it requires in the shape of draught oxen, cows, calves, butter, and cheese.

The following Table for prices for beef, pork, and butter will not be uninteresting:—

Market Prices per Pound.	Beef.		Pork.		Butter.

Fattening of cattle.

The fattening of cattle for consumption is of more or less importance in every province; but has not attained to such importance as a branch of farming as to warrant for Prussian farming the adoption of the maxim of "Plenty of meat and manure" of English farming. In the Province of Prussia the complete fattening of cattle takes place seldom, for few farmers have sufficient capital to wait a long while for their returns. The possibility of fattening for slaughter depends, therefore, chiefly upon condition of the pasturages and upon a suitable summer. In Pomerania, although improvements have taken place, the fattening of cattle is on the whole not remunerative. In Posen it only takes place with profit on isolated large properties where a subsidiary industry exists. Silesia understands the process of fattening better, and having also extended industries

can carry it out with considerable advantage. Yet the numerous middle and smaller distilleries and breweries only half fatten cattle, and cannot rear young cattle. Saxony differs little from Silesia, except that probably stall-feeding, if not complete fattening, is more practised throughout all classes of farmers. Westphalia fattens cattle by stall-feeding only on the larger properties and in towns in connection with breweries and distilleries. Stall-feeding is, however, making progress. But the fattening on pasturages is more important. In the Lower Rhine the rich pasturages are the most important and extensive in the State, and fetch on lease a rent of even 5*l.* per acre, which is comparatively an exceedingly high rent for Prussia. But apart from these districts fattening succeeds wherever meadows or an industry give ample fodder; but pure farming can obtain no profit by fattening its cattle in Rhineland.

Sheep.

54. Sheep rearing is passing through a crisis. Merino (Negretti) sheep breeding had become so profitable, that breeding in and in with merino sheep took place with a view to produce as much wool as possible, regardless of the size of the sheep. The animal was consequently unfit for food, and the whole profit depended upon the price of wool. As long as wool kept its price, all went well; but, as soon as wool fell in price from various causes such as the introduction of Australian wool and the great difference between the gross and the useful nett weight of German wool, these sheep were suddenly deprived of a great part, even of a half, of their value. The rearer of sheep has therefore suffered great losses. A revolution is taking place, and henceforth the German farmer will rear a sheep not only for wool but for meat. For this purpose he is reverting to the home race of sheep. As yet, however, only a few of the more intelligent farmers have perceived the necessity for such a change. It must of course be remembered, that, although the pure wool-bearing race of sheep formed the most important portion of the sheep in the State, several other races existed throughout the land.

Fattening of sheep.

The fattening of sheep is seldom profitable to the farmer in West and East Prussia, answers much better in Pomerania, is an unsatisfactory process in Posen, is of little account in Silesia, but is of great importance in Saxony and Westphalia. In Brandenburg it is beginning, and in Rhineland sheep rearing even is exceptional.

Various.

55. Swine enter largely into the small-farmer's economy, and fat geese are the pride of the farmer's wife. Ducks and pigeons are often reared, but turkeys do not as a rule enter the farmyard. Fowls exist to the number of 19,000,000 and are estimated to yield 800,000,000 of eggs of a value of 1,320,000*l.* Bee cultivation is largely increased, but the various attempts at cultivating the silkworm have had very little success.

(*g.*)—*Agricultural Industries.*

56. Inasmuch as the influence of industry upon agriculture is of importance to this investigation, it is desirable before concluding this division to glance rapidly at the industries intimately connected with agriculture. Of these the flour mills need not be referred to, as they do not affect the course of agriculture. But the distilleries affect it considerably. The following figures show how they have increased in importance:—

Distilleries.

In 1831 there were 22,969 of which 69 per cent. were in the country; in 1865 there were 7,711 of which 82 per cent. were in the country. But the spirit duty produced, in 1831 an aggregate amount of 5,248,579 dollars; in 1865, an aggregate amount of 10,372,181 dollars; so that, after allowing 20 per cent. in the latter amount for increase of duty, it is evident that the production of 7,711 has been more than half as much as that of the 22,969 distilleries of 1831, The greatest increase has been in Posen which has nearly quadrupled its production. Prussia has increased it by 33 per cent., Pomerania by 52 per cent., Brandenburg by 30 per cent., Silesia by 68 per cent., Saxony by 70 per cent., and Westphalia by 60 per cent. But in Rhineland the production has decreased by nearly 32 per cent. Silesia and Brandenburg has the largest production; Prussia, Posen, and Saxony come next; Pomerania follows close, and Rhineland preceeds Westphalia.

The distilleries have most frequently been established for agricultural purposes, but the fattening properties of their refuse are not high.* It has been held that no large estate could be farmed without a distillery. In fact the distillery took the place of the slaughter-house, but with a different kind of assistance to the farmer. The Prussian maxim of farming was indeed held to be "plenty of alcohol and of manure." The distillery was a machine for manufacturing manure like the cattle fattened for meat is in England. It is considered by some, that for this purpose it will disappear when the means of communication are better. In the meantime it is endangered as an industry by the fact that whereas, formerly German alcohol commanded the foreign markets for foreign alcohol, it is now exposed to

* There are, however, various opinions on this point. The chief difference seems to be that the mash from corn distilleries fattens well, whereas that from potatoe distilleries is often wanting in fattening powers.

severe competition in many markets. Several distilleries have recently earned no profit on their spirit, so that the production of manure has been disadvantageous.

Beetroot sugars.

57. The industry of beetroot sugar is of great importance to agriculture. The following figures will show its rapid rise;—

	Cwt.
In 1836 it produced	28,162
In 1846 „	331,011
In 1856 „	1,807,974
In 1866 „	3,940,518

Its chief seat is in Saxony in the provincial district of Magdeburg, but it has importance also in Silesia and Brandenburg, as will be seen from the following figures;—

Pomerania has	..	8	Mills, using	.. ..	1,221,763 cwt. of Beetroots.
Brandenburg has	..	18	„	.. ..	3.119,657 „
Silesia has .	..	40	„	.. ..	5,345,911 „
Saxony has	..	141	„	.. ..	24,136,968 „
Westphalia has	..	2	„	.. ..	145,913 „
Rhineland has	..	4	„	.. ..	1,318,366 „
Total	..	213	„	.. ..	35,278,578 „

The hundredweights of the above enumeration are the German custom-house hundredweights, consisting of 120 German pounds. The new provinces have six manufactories using 701,788 cwt. of beetroots. As the Zollverein has only 296 mills using 50,712,709 cwt. of beetroots, it is evident that the industry has its chief seat in the kingdom of Prussia. The inland sugar duty is levied on a very unskilful plan, and there exists an agitation for a duty on the sugar produced instead of on the raw material. Wherever this industry exists, the parings of the beetroots, after the extraction of the sugar, are used to feed cattle. They are mixed with chaff and given dry. The chief mills seem to grow their own beetroots, and either own or lease, or own and lease, large tracts of land for cultivation. The system is high-farming with expensive manuring and deep ploughing, with the object of getting maximum crops of beetroot. Cereals and forage crops are also grown, but without any set rotation.

Flax.

58. The flax industry has its seat in Silesia. Its importance can be apprehended from the following Table:—

Flax Spinning.	1855–57.	1858–61.	1862–64.	1865.
Prussian spindles	60,000	89,475	107,550	143,500
Zollverein spindles	74,000	120,000*	146,000	188,500
Cwt. of material for Zollverein spindles	166,500	300,000	397,123	427,125
Average excess of importation	121,692	237,805	139;319	150,000*
Remains of home growth	44,808	62,195	257,803	277,125
Of which for Prussian spindles, according to number of spindles	36,330	46,641	190,643	210,981

This Table shows a great increase in the home production of flax. The actual area of flax cultivation is not known. The industries of starches, dextrin, vinegar, chicory, oil, &c., need not be further mentioned. Various particulars of these and the other agricultural industries, as also of the breweries, are to be found in paragraphs 31 and 38 of Part I.

(*h.*)—*Supplementary Remarks.*

Means of communication.

59. The first of these supplementary remarks is that the means of communication are not as fully developed in Prussia as they might be. The defect is twofold, for there are not enough roads, and the local roads are not in the best condition. Hence there are few districts in which the locomotive for a steam plough could travel. Of the way land not one-tenth is accounted for by the railroads and turnpike roads. The ordinary parish and accommodation roads are in overwhelming proportion. Even the parish roads are seldom macadamized. The following Table gives the length of railroads and turnpike roads for each province:—

Length in English Miles.	Prussia.	Pomerania.	Posen.	Brandenburg.	Silesia.	Saxony.	Westphalia.	Rhineland.	Kingdom.
Of railroads, 1862	363	275	259	488	796	482	491	749	3,903
Of turnpike roads, 1862	2,397	1,572	1,516	2,008	3,402	2,229	3,496	3,927	20,547

* This is estimated.

60. The result of the increase of means of communication is an interesting subject, into which I cannot now enter. But it will not uselessly increase the necessary length of this Report to give the following Tables from an interesting paper read last year by Dr. Wilckens before the Congress of North German Agriculturists:— Result of their increase.

It thus appears that whereas the population increased, the price of rye diminished, but that before railways the difference of price was greater not only between provinces, but also between the highest and lowest prices in a province than it has been since railways. The

third Table shows the relative importance of the various ways of communication in the State and in each province. The remaining two Tables are interesting as showing the position of each province in respect of development in certain particulars. The invariably high place which the western provinces take, and the invariably low place which East and West Prussia takes, will be remarked. It will be further observed that the price of rye seems to follow the development of communications. Similar Tables show that the price of wheat does not follow it. The reason probably is that rye is the staple cereal of the Kingdom for home consumption, whereas wheat is affected by the fluctuations of foreign markets.

The general conclusion of Dr. Wilckens is that the prices of rye and wheat, which form the chief produce of North German agriculture, are dependent upon the completeness of the network of communication with the above difference, and that their average prices are both in direct relation to the cheapness of communication.

The tendency of the age is to bring about a general level of prices, and it is therefore interesting to see that in the Kingdom of Prussia the development of means of communication has caused this tendency to manifest itself in the above important particulars.

Latest notices of agricultural progress.

61. According to the annual Report of the Agricultural Board for 1868, agriculture has been improving in Prussia, and the advantages of deep ploughing, irrigation, drainage, improved implements, introduction of high-bred cattle, scientific feeding and rearing of cattle, more careful attention to manures, and use of artificial manures are receiving more and more recognition by small as well as large proprietors, and in some provinces, such as Silesia, Saxony, and Pomerania, more than in others. Beyond noting that, in provinces without an agricultural industry, it is sought to place the agricultural centre of gravity in

Smaller proprietors.

the production of meat, there is little else to remark. Usually the smaller proprietors seem to follow the lead of the larger proprietors in respect of agricultural improvements, but the complaint is made that the peasant proprietors are in some districts indolent and careless with regard to improvements. Want of circulating capital in yet other districts interferes with the adoption of new systems and new implements not only in respect of the smaller but also of the larger farmers.

The advantages of changing the seed are being recognized, but hitherto the smaller proprietors had been especially defective in this matter. Advantageous rotations of crops are adopted, which vary according to the soil and wants of the district. In many parts it is attempted by high farming to produce maximum crops.

Result of extinction of rights of common.

One general observation will be interesting, namely, that the separation of commons is always followed by improved cultivation, and especially by stall-feeding in lieu of pasturage. Hence there arises to the farmer a greater gain from the land, and there follows a more careful system of cattle feeding. There is an universal opinion of the direct advantage of this separation apart from the direct advantage of the consolidation which accompanies it.

62. It is hoped that the various subdivisions will enable the reader to form an idea of the state of agriculture in Prussia, although they have necessarily treated so briefly of the various subjects. It must, however, be remembered that high farming and low farming are relative terms of a very elastic nature. They have been used in this division to denote the relative character of the styles of farming in Prussia and not to denote the existence in Prussia of the same high farming as that which exists in England and Scotland. English high farming may be found in Prussia; but it is not yet an important element of agricultural development.

Manufactures.

63. Lastly, it is to be remembered that Prussia has her manufacturing provinces and also various manufactures scattered throughout the Kingdom. The importance of her manufacturing industry can be seen from paragraphs 32 to 39, Part I. It is needless to remark that, where any such a manufacture exists, it necessarily has an influence upon the agriculture of the neighbourhood, and even of districts somewhat remote. The question of the difference which it makes to the individual cultivator of the soil is one of the most complicated questions of political and social economy. Its answer varies according to the varying conditions of agriculture and manufacture in the district, and no general answer to it can be gathered from treatises or constructed from the few personal inquiries which can now be made in this capital. Such an answer needs not only to embrace the universal and well-known facts of political economy, but needs to include all the special and more local facts, which make up the sum of the total influence of manufacture upon agriculture. The former can be predicated of any part of the world, but the latter require to be specially investigated. So far as time will admit, the question will be answered in the record of my observation and inquires in the few districts which I shall be able to visit, and will doubtless

be referred to in Mr. Consul White's Report respecting the provinces which he has been enabled to visit.

64. Time has unfortunately not allowed me to add to the remarks in paragraphs 190 and 191 of Part I, any further information as to agricultural institutions of instruction and agricultural societies. But in respect to the provincial loan funds referred to in paragraph 192 of Part I, I am now enabled to state that their loans are only made to corporations and not to private individuals. The latter have no special facilities for obtaining circulating capital, and must go into the mortgage market whether they be large or small proprietors. Provisional loan funds.

But the interesting fact must not be omitted that the agricultural associations frequently send out trained itinerant instructors in agriculture, who travel about for the purpose of delivering lectures on, and of instructing the peasantry in, advanced principles of cultivation. Itinerant instructors in agriculture.

(D.)—*The Population of Land.*

(*a.*)—*In general.*

65. According to the census taken on the 3rd of December, 1867, the population of Prussia, as it now is, was a little over 24,000,000. Of these nearly 7,500,000 lived in towns ("Städte") or villages ("Flecken"). It has been discovered that these figures will have to be slightly corrected, but in the meantime their approximate accuracy may be assumed. These two catagories of towns and villages include even hamlets of as few as 275 inhabitants. If the population living in hamlets, villages, and in towns of less than 5,000 inhabitants be excluded from the above population then the urban population will be rather over 5,000,000, and the rural population about 19,000,000, *i.e.*, nearly four times as numerous. It is probably true that many inhabitants of towns of less than 5,000, and of villages and hamlets, are entirely or chiefly dependent upon manufacturing industry apart from agriculture. But, on the other hand, it is probably true that several towns of more than 5,000 inhabitants contain a population entirely or mainly dependent upon agriculture, or upon industry connected with agriculture. The one probable inaccuracy cancels the other probable inaccuracy. The above number and proportion of rural population may be therefore taken to represent the number and proportion of the population dependent upon the land and its produce. If the enquiry could be extended so as to include the number of the distributive classes in towns over 5,000 inhabitants, whose members and their dependents, derive their livelihood from the distribution of the produce of agriculture and agricultural industry, the number and proportion of that population would be yet more increased. But it is sufficient to take them, as they now stand, in order to comprehend the importance of agriculture to the Prussian Monarchy of the present time.

66. The details of the census are not yet sufficiently put together or published to enable me to ascertain from its results all the points which it would have been desirable to include in this Report. From the existing and ready materials the following facts can be ascertained. It will, however, be interesting previously to give an estimate of the rural population of the Prussia of before 1866, which is the Prussia of which this Report treats. If the bases of the computation in the foregoing paragraph be taken, and if a slightly reduced ratio of rural to urban population be assumed to be true of the Prussia before 1866, it can be estimated that out of the more than 19,500,000 of population in the eight old provinces over 4,000,000 are urban population in towns of over 5,000 inhabitants, and about 15,500,000 are rural population, *i.e.*, the rural population is scarcely four times as numerous as the urban population. In other words, the urban population on this basis is now scarcely 20 per cent. of the total population. But if the hamlets and villages be included then it is about the 29 per cent. mentioned in paragraph 9 of Part I. Populatien of old Prussia.

67. From some statistics, based upon the census of 1867, and published in the Prussian Statistical Journal, the following Table showing the purely agricultural population in 1867, as compared with 1861, is extracted:— Agricultural population.

	Agriculture, Cattle Breeding, Cultivation of Vine, Gardening.					
	Persons Occupied.		Dependents upon preceding.		Totals.	
	1861.	1867.	1861.	1867.	1861.	1867.
Prussia	690,377	690,290	750,440	1,317,506	1,440,817	2,007,796
Posen	327,819	328,108	388,566	659,220	716,385	987,328
Brandenburg	379,455	359,257	491,338	648,546	870,793	1,007,803
Pomerania	284,406	272,816	308,296	533,850	592,702	806,666
Silesia	660,416	659,505	1,044,941	1,149,952	1,705,357	1,809,457
Saxony	337,219	298,025	469,122	498,178	806,341	796,203
*Westphalia	276,286	246,677	524,535	464,846	800,821	711,523
*Rhineland	473,078	432,276	993,436	852,231	1,466,514	1,284,507
Monarchy	3,429,056	3,286,954	4,970,674	6,124,329	8,399,730	9,411,283

* The Jade territory is included with Westphalia and Hohenzollern with Rhineland.

68. The following Table gives several points of interest in connection with the agricultural population of 1867 :—

	Males.	Total.	Females.	Total.	Total of Occupied.	Total of Dependents.	Grand Total.
A. Agriculture, Cattle Breeding, Cultivation of Vine, Gardening :—							
a. Owners of land, of vineyards, of gardens, tenants, bailiffs, agents, &c. :							
Number of persons occupied ..	923,937		165,105		1,089,042	..	
Number of their dependents ..	1,368,801	2,292,738	2,186,626	2,351,731	..	3,555,427	4,644,469
b. Assistants, apprentices or pupils, servants, and day labourers in agriculture and cattle breeding :							
Number of persons occupied ..	1,308,804		889,108		2,197,912	..	
Number of their dependents ..	978,349	2,287,153	1,590,533	2,479,661	..	2,568,902	4,766,814
B. Forests, &c. :—							
a. Agents of all kinds :							
Number of persons occupied ..	15,264		50		15,314	..	
Number of their dependents ..	15,313	30,577	31,176	31,226	..	46,489	61,803
b. Labourers :							
Number of persons occupied ..	10,299		905		11,204	..	
Number of their dependents ..	9,077	19,376	16,954	17,859	..	26,031	37,235
Total	4,629,844		4,880,477		3,313,472	6,196,849	9,510,321

The purely agricultural population of the Prussia since 1866 is therefore more than 48 per cent. of its population, and of the Prussia before 1866 is therefore nearly 49 per cent. of its population. These numbers and this deduction must, however for the present, be received, in a comparison with the results of the census of 1861, with caution. There are probably several local inaccuracies which, in the aggregate, have given an apparent but unreal meaning to at any rate that part of the census of 1861 from which the relative proportions of industrial and agricultural population are deduced. The coming census of 1870 will, no doubt, supply the needed confirmation or the necessary correction.

By provinces.

69. It will also be interesting to give, from the same source, a Table showing various points of interest in connection with this agricultural population, province by province.

By Provinces.	Persons Occupied. — Males. Agriculture.	Forests.	Total.	Total of Province.	Per cent. of all in all Occupations.	Per cent. of total Population.	To 100 of *a*, there are of *b*.	Females. Agriculture.	Forests.	Total.	Total of Province.	Per cent. of all in all Occupations.	Total of Both. Total of 4 and 11.	Per cent. of all in all Occupations.	To 100 of *a*, there are of *b*.

				2,258,304	41·8	21·8	137				1,055,168	49	3,313,472	46·9	193

Note 1.—*a* and *b* are the *a* and *b* of the preceding Table.
Note 2.—Columns 5 and 12 represent proportion to persons occupied in all kinds of occupations in the Province.
Note 3.—Westphalia includes the Jade Territory, and Rhineland the Province of Hohenzollern.

70. At present it is impossible in respect of the census of 1867, to separate the tenants from the proprietors, or to sub-divide each of these classes into the class entirely occupied in agriculture, and the class auxiliarily occupied in agriculture. This has been done in respect of the census of 1861. It is, therefore, desirable to reproduce here in greater detail the Table given in paragraph 31 of Part I. The difference between the totals in this Table and in the Table in paragraph 31 of Part I, is in consequence of Hohenzollern and the Jade territory having been by mistake included in the latter.

Agricultural Population in 1861.	Prussia.	Pomerania.	Posen.	Brandenburg.	Silesia.	Saxony.	Westphalia.	Rhineland.	Monarchy.
A.—Occupied in Agriculture alone—									
Owners	118,165	89,952	66,932	74,090	165,013	65,363	62,387	161,677	753,579

The various classes engaged in agriculture will be more nearly regarded in the following sub-divisions.

(*b*)—*The Large Proprietors.*

71. The only sufficiently complete statistics for treating of large, middle, and small proprietors are those of 1858, given in the Table of paragraph 16 of this part. The observations therein made as to the probable inaccuracy of the counting of large and small proprietors must, however, be borne in mind in the course of the following remarks :—

Large proprietors, their ratio to land-owners.

The large proprietors, *i.e.*, proprietors of more than 400 acres, then formed scarcely a one hundred and twentieth part of the aggregate of land-owners, and probably after due correction of the number, not a one hundred and thirtieth part. Is not the proportion in England or Ireland rather the reverse of this ?

Farming owners of large estates.

It has already been noticed that it is the practice of the land-owners, even of large entailed estates, to farm their land either directly under their own superintendence or indirectly by a bailiff. This is so universal that it will suffice to deduct, say, 5 per cent. from the total of large proprietors in 1858, to obtain approximately the number of large land-owners who then farmed their own land. But another deduction for various proprietary bodies which usually let their lands should be made if the materials were at hand for doing so. Let 5 per cent. be assumed to represent this deduction, then, with notice of this possible inaccuracy, to however only a small degree, the 90 per cent. of the large proprietors entered in the seventeenth column of the Table of paragraph 16, and connected in paragraph 18 of this Part, can be taken to represent the large farming proprietors, *i.e.*, 13,500 out of 15,000. Some of these, however, let their estates for a time, and others farm one estate and let the rest of their lands. This custom of large proprietors farming the land has its good side and its bad side. The former, however, seems to more than compensate for the latter. It is good because, amongst other things, it tends to cause residence on the estate, and, at any rate, to cause the large land-owner to identify himself with the agricultural interests of the district and its population. It is bad in so far as large estates may be farmed with insufficient capital. It is not so much the fact of farming itself that causes this bad quality as the fact that the pride of landed possession prevents an owner without a sufficiency of circulating capital from selling a portion of the land in order to farm the rest better. The consequence is that a large landowner is often obliged to be satisfied with minimum crops on an extended area,

instead of maximum crops on a smaller area. Hence, too, the large owner without capital finds it better to let his land on agricultural leases than to farm it himself.

Owners of privileged estates.

72. By referring to the Table in paragraph 21, it will be observed that, of the owners of privileged estates only 4,637 have more than the average 400 acres of land, an average calculated for the whole Kingdom, and, therefore, comprehending for some rich soiled provinces estates of less than 400 acres. It would therefore appear that of the corrected 15,000 large landowners, scarcely over 4,000 are in possession of privileged estates. It would be interesting, if it were possible, to show how many such estates had changed owners since the beginning of the century, and how many had passed from the ownership of the nobles. It would also be interesting, if it were possible, to state how many such estates, and how many estates in general of large landowners, were feudally held or in *fidei commissa*. The probability is that one-half of the privileged estates are so restricted, and that very few indeed of other large estates are so restricted. It will be recollected how small a proportion of the total acreage of the Kingdom is subject to restrictions of this nature. Nearly, if not quite the whole of that restricted acreage is probably included in the acreage of the estates of the large proprietors of over 400 acres.

Finally, it may be remarked, that scarcely 800 large proprietors have estates of 1,000 acres and more, and of these scarcely 100 held estates of 2,000 acres and more, whilst the owners of 10,000 acres can almost be counted on one's fingers.

Property of higher classes, and of peasantry.

73. Before proceeding to the next sub-division, it will not be out of place to show, so far as such distinctions have been made in the statistics on the subject, what is the proportion of the property of the higher classes, and of the so-called rustic properties ("Rustical-besitz"), which are in fact the property of the yeomanry and peasantry. The following Table sets forth the facts, that in the provinces of Prussia and Saxony such properties have a half of the province, and the large non-peasant private properties have scarcely one-fourth or one-sixth of it; and that the acreage of the former throughout the six eastern provinces is as great as the acreage of the latter:—

Denomination of Properties.	Area of each Kind in the various Provinces.					
	Prussia.	Posen.	Pomerania.	Brandenburg.	Silesia.	Saxony.
1861.	Acres.	Acres.	Acres.	Acres.	Acres.	Acres.

Total	14,821,267	6,941,058	7,378,258	9,615,010	9,300,279	6,050,783

(c.)—*The Middle Proprietors.*

Independent yeomanry.

74. The middle proprietors are those who hold land in quantities, from 20 to 400 acres. They number 404,871, and with their families about 1,500,000. These 400,000, and the upper 600,000 of the small proprietors, form the independent yeomanry and the proprietary peasantry of Prussia, but of course include some owners of privileged estates, and a few others, who do not belong to the peasantry as a class, with their families. These are computed to number nearly 4,000,000 persons, that is more than one-fifth of the total population. They form, in all probability, the most valuable section of Prussia's population—not the most wealthy section, but the most valuable to the nation.

Owners of 20 to 200 acres.

It will have been observed in the Table of paragraph 16, that only 15,048 middle proprietors have property of from 200 to 400 acres, and that the overwhelming majority of 389,823 have land of from 20 to 200 acres. The middle proprietor who holds 50 acres, is considered well to do, and is not unfrequently the chief man of his village. It must be observed, once for all, that the terms "well to do," "comfortable," and the like, are only used relatively, and with regard to relation in Prussia. It would be impossible, within the space of this Report, to draw a comparison between classes in Prussia and classes in England or Ireland. Time and space only allow the relative positions of the classes to each other in Prussia to be touched upon; and readers, who wish to carry the comparison further, will, with their own knowledge of such matters in England and Ireland, be able, it is hoped, to do so with the data given in this Report.

Team-requiring peasant farms.

75. The team-requiring peasant farms nearly coincide with this middle property, and their number has consequently been repeated in the Table in paragraph 16 of this Part. It will be recollected, that in paragraphs 172 to 179 of Part II, it has been shown, that to 1859, the team-requiring peasant farms, although they had slightly decreased in number

in the forty years, had maintained in an unexpected degree their number against purchase by non-peasant owners, and against splitting up into new team-requiring farms and small holdings. It will be interesting now to add, that it results from an inquiry just being concluded by the Prussian Government, that within these later years they have continued to maintain themselves, and have not lost ground; but some large peasant properties had been separated into two or more, without losing the team-requiring quality. There are in some provinces very large peasant properties, which, as in the case of other large landowners, are too large for the capital of the owner. A separation into two or more parts of these is no disadvantage to the nation, and seldom even to the individual.

The limit of 20 acres is in some provinces too little to constitute a team-requiring farm, and too little to support a family decently. But in other provinces it is more than enough to do both of these things. Hence, the number of middle proprietors excludes a considerable number of proprietors, who are enabled to live, and to bring up their families decently by agriculture alone.

(*d.*)—*The Small Proprietors.*

76. Many would probably call the majority of the landowners in the previous subdivision, small proprietors; but it has been necessary to follow the Prussian statistics in this respect. The number of small proprietors is 1,696,909, according to the fifth column of the Table, in paragraph 16 of this Part: but according to the calculation in paragraph 18, can be estimated at 1,400,000,. Of these a considerable number possess sufficient land to support themselves and their families. The minimum for this purpose is 7 acres, or thereabouts, in very fertile and well-favoured districts and increases according to the decreasing local advantages, to 20 acres or more. If the number of peasant farms, not team-requiring, in column six be taken for a guide, then the number of the proprietors of the above minimum may be estimated at about 600,000. It is not intended to affirm that all these 600,000 owners are able to bring up families in average comfort and without occasional straits, but that they rely entirely upon the productiveness of their agricultural labour on their land, and in average times keep poverty at a great distance, and are in a position by great thrift to increase the ease of their position. The remaining small proprietors fall mainly into the category of persons only auxiliarily occupied with agriculculture. It will be borne in mind, that the figures of 600,000 are only approximative, and have been stated in knowledge of the difficulties of the subject which have been previously pointed out. That they are not very inaccurate, can he inferred from the following considerations:—The 400,000 middle proprietors, of which the accuracy of the return is not doubted, form together, with these 600,000, a total of 1,000,000, which corresponds, after certain allowances on both sides, with the return of 1867, of over 1,000,000 owners, tenants, &c., engaged in agriculture.

Their number.

Independent small proprietors.

77. With regard to the remaining 800,000, who are day-labourers, or who have another industry, either as their chief occupation or as auxiliary to their agriculture, little need be said. They form an important class of land-owning agricultural labourers, contain also many artizans, and probably include the small industrial people of the villages. At any rate these 800,000, and the 350,000 who possess houses without land, make together 1,150,000 persons who subdivide into these three chief categories.

The other small proprietors.

(*e.*)—*Tenants.*

78. Little need be here stated with regard to tenants, for their number and general position have been already treated in sub-division (*d*) of division (C) of Part II. They include tenants paying 5,000*l.* of rent, and tenants paying a few shillings. As has been previously stated, they are mainly tenants of the State demesnes, of the lands of communalties, and tenants in the Western Province; and lastly, in New Pomerania, where the yeomanry can scarcely be said to exist as a class. But they are also tenants of privileged estates and of free estates. Under the latter category come many tenants of peasant properties. The peasant-owner in this case is frequently absent, in order to work at some manufacture. The peasant-owner may, however, have become a landlord, as is frequently the case in the beetroot districts, where the beetroot sugar manufacturer takes on lease the peasant properties, and the peasant lives upon the rent.

Categories of tenants.

It is regrettable that it is not possible to separate exactly the tenants of State demesnes, of lands of communalties, of lands in mortmain, and of entailed lands, from the number of tenants in the Kingdom, excluding New Pomerania and Rhineland. In Rhineland agricultural tenants are frequent, bnt why they are so frequent will remain unknown to me until I have accomplished my intended short visit to one or two typical districts in that province.

The 30,000 tenants occupied entirely with agriculture are, by the side of the 1,000,000 proprietors similarly occupied, of very little moment to the State.

79. The intention was expressed in a previous portion of this Report to give an epitome of the various kinds of agricultural leases in use, but the intention cannot now be carried out. In New Pomerania it may, however, be added, the whole of the seed necessary for the farm is frequently provided by the landlord. The circulating capital of the tenant need not, therefore, be so large as it would otherwise have to be. **Leases.**

Public bidding seems to be adopted in respect of the State demesnes, of lands of communalties, and of lands in mortmain. The State demesnes have largely profited by it, but the competition seems seldom to have raised the rent too high. The system of letting by valuation or arbitration,* which seems to obtain at Greifswald, and of which it was intended to send an account, must pass for the present without further notice. **Public bidding.** **Valuation.**

Although sufficient information to warrant a decided opinion is not at hand, yet the suspicion, expressed in a former portion of this Report, that the rent obtained by agricultural leases would usually be in low proportion to the value of the land, seems to be not ill-founded, for I am informed that, except in respect of small portions of land, the rent seldom yields more than 3 per cent. on the value of the land.

(*f.*)—*The Agricultural Labourer.*

80. It is interesting to note at the outset that the Stein Hardenberg legislation has largely conduced to the increase of agricultural labourers. This could have been predicated of the change from compulsory to voluntary labour. But the fact of a larger rate of increase in the agricultural than in the town population has been proved. For instance, in the province of Prussia, in a period of forty-two years to 1861, whereas the population increased by 81 per cent., the urban population increased by the lesser per-centage of 60·1, and the rural population by the greater per-centage of 87·7. The cessation of restrictions on the supply and demand of the agricultural labour market had, no doubt, a most beneficial influence on the development of agriculture. Yet that development must not be solely attributed to the Stein-Hardenberg legislation.

81. Of the 2,197, 912 persons classed at A, *b*, of the Table in paragraph 68, 2,000,000 may probably be taken to represent agricultural labourers. Their families and dependents would form rather more than another 2,000,000. These labourers are day labourers, and farm and field labourers of both sexes. A very considerable portion of them are either owners or tenants of land, who work as day labourers at harvest and other times. The day wages are apparently higher than the wages of the farm and field labourers who are employed by the year; but, if allowance be made for the risk of want of work and for other incidents of the day labourer's earnings, they are not really higher, but on the contrary, he probably is in a worse position than the regularly engaged farm labourer. This difference is his payment for his independence and family life. On the other hand this position makes him exert more diligently his powers. Like that of the day labourer is the position of the great majority of small owners and tenants. It depends upon the facilities of acquiring or leasing land in the neighbourhood as to whether the day labourer is an owner or a tenant. Dr. Meitzen adds, "the inclination of the German to establish his family upon its own plot is a blessed trait of the greatest moral advantage. It has been sufficiently shown that the possibility of acquiring land fosters hope, encourages energy, and never lets useful activity flag." He is one of a multitude who think with him, in Prussia. Many of these small occupiers from love of property and family raise themselves above the rank of day labourers. But on the average the profit of the mass of very small holdings must be slender. The occupiers obtain a maximum gross produce, but the excess over the ordinary gross produce is required to pay the interest of the purchase money or the rent, which competition had increased. **Their number.** **Influence of proprietorship.**

(*a.*)—*The Labourer's Income.*

82. It must be remarked at the outset, that it is seldom the custom to pay all the wages in money. Very frequently the farm servants are boarded at the farm house. In other cases the payment is chiefly made in kind. The rate of a day labourer's wages is of great economical importance. Dr. Lengerke made an elaborate inquiry into that rate and

* This system has—so I have learnt since this Part was written—been substituted by letting to the highest bidding; hence no separate account is needed.

Position in 1849.

the other conditions of the day labourer for 1849, and the following Table gives the result for the various provinces. The unity is the family of an agricultural labourer, consisting of husband and wife, two to three children under 14 years, and an old person. The customary mode of life and not a supposed necessary mode of life was the standard adopted.

	House.	Firing and Lighting.	Food.	Clothing.	Fodder for Cattle.	Maintenance of Working Implements, &c.	Salt (condiments).	Taxes and Rates to State Schools, &c.	Total.	At the rate of 11 hours work by hand, in May, June, July and August.

Kingdom	8·6	8·7	53·5	18·1	6·1	3·2	2·7	4·1	105·1				

Position within the last six years.

83. What has been since ascertained on this important subject from the records of the land tax and from other sources, will now be epitomized for each province.

In provinces of Prussia.

In Prussia the wages of the farm labourer by the year are for a man as a rule 60*s.* to 90*s.*, and in better neighbourhoods where there is a manufacture as much as 105*s.*; for a girl 36*s.* to 60*s.* and in the better neighbourhoods 75*s.* and even 90*s.* Various higher classes of labourers have considerably higher wages.

In the smaller peasant farms the general farm servant has a smaller wage, but an allowance in clothing and linen.

Diet.

The board of a general farm servant, consists usually in summer of four and in winter of three meals; in the morning, milk or flour porridge, or grits, and dried peas and potatoes; at midday, vegetables and dumplings, sometimes with meat and sometimes without meat; at vesper time, milk porridge or clotted milk with bread, or also brandy; in the evening, potatoes with herrings and porridge; and on fête days, roast meat with white or fancy bread.

It is general to give meat two or three times a week, and for dinner not less than half a pound and as a rule not more than three-quarters of a pound. In the lowland of the Dantzic provincial district the farm labourer gets yearly 100 lbs. of fresh meat and 75 lbs. of fat of various kinds. The man get 10 lbs. to 16 lbs of bread.

Such a boarding is reckoned at a yearly value of 9*l.* to 13*l.* 10*s.* according to the district, and for a girl, who gets less bread, 7*l.* 10*s.*

Payment in kind.

On the larger farms it is not unusual to substitute for boarding a payment in kind. Thus for a man, 10½ bushels of rye, 10½ bushels of barley, 3 bushels of peas, 18 bushels of potatoes, 3¾ bushels fattening corn ("Mastgetreide"); one-quarter of an ox, as meat, or 21*s.*, half a thin pig or 15*s.*, 12*s.* for herrings, salt and pot money; in winter ½ a quart, in summer 1 quart, of milk daily; firing free; and on fête days beer and brandy. The varieties of this plan are numerous.

Contract labourers.

The custom is wide spread of establishing by long contract, labourer's families in houses on the property, giving them house and payment in kind. These receive for instance; house free, firing free, fodder and pasturage for a cow, a sheep and their increase; pasturage for 2 pigs; ¾ bushel of flax sowing seed, ¼ of an acre of potatoe land, 15 to 22½ bushels of corn for the summer months; in winter for threshing with flail every 10th or 11th and with machine every 13th to 16th bushel; moreover, the man gets in daily wage 4*d.* to 4½*d.*, and the girl or woman (whom he must provide) 2¼*d.* to 3½*d.* If he provides a second person, he usually receives the higher wage of a man. The income of such a family is computed at from 20*l.* to 21*l.* a year.

Computed income.

This institution is, however, going through a process of reform. The delegation to find the second labourer is not easy to fulfil, and the whole system, inasmuch as the day is paid for and not work, induces to shirking. Possibly this institution is a relic of the feudal obligations to agricultural labour, which took root in the transitional period. It is being reformed into a system of free labourers. These receive for instance house free, potato land, pasturage for a pig, free medical attendance; and the man is bound throughout the year to work at a daily wage of 6*d.* to 1*s.*, and the woman in the summer at 5*d.* to 7*d.*

Free labourers.

The practice varies, but the payment for threshing remains everywhere as under the old system.

Piece work is thus paid:—For mowing, 13*d.* to 21*d.* per acre; for digging up potatoes, ½*d.* to 1¼*d.* per bushel; for dressing with marl, 13*s.* 6*d.* per acre, and with mould, 27*s.* per acre. Piece work.

The climate renders good food necessary for the labourers, and renders difficult every increase of external comfort by the cold and long winter.

84. In Pomerania the wages vary much. The lower rates are—for a man, 54*s.* to 75*s.*; a boy, 24*s.* to 45*s.*; and for a maid, 36*s.* to 54*s.* The higher rates are—for a man, 120*s.* to 150*s.*; for a maid, 60*s.* to 90*s.*, and also 20 ells of linen, or one-third of a bushel of flax seed for sowing and 2 lbs. of wool. The board is generally good, and consists usually—in the morning of milk porridge, with dumplings or grits; at midday of milk porridge and potatoes, vegetables, pease, beans, "bubble and squeak;" in evening, of milk porridge and potatoes, with herring or potato soup. To this is added meat three or four times a week, either ¼ lb. of bacon or ½ lb. of other meat, and on Sundays baked fruit and dumplings. The man receives 14 lb. of bread with 1 lb. of butter or lard a week, and the maid 10 lb. with 12 ounces of butter or lard. This board is computed at 10 guineas a year. In Pomerania. Wages. Diet.

Besides the farm servants three-fourths of the necessary labourers are engaged by the year. They have usually house and firing and the keep of one cow, three to four sheep, and often also one to two pigs. Garden and tillage up to 1⅓ acres free, and more or less payment in kind. In return they serve on certain days without money wage, and perform all necessary agricultural work at lower rates of wages. Their position varies considerably in different districts. Contract labourers.

Piece-work is paid rather higher than in Prussia. The casual labourers are also paid for harvest work 15*d.* to 24*d.* for twelve to fourteen hours to the man and 9*d.* to 12*d.* to the woman; for summer work 12*d.* to 18*d.* for ten to twelve hours work to the man and 6*d.* to 9*d.* to the woman, and for winter work 9*d.* to 12*d.* for eight hours to the man and 6*d.* to 9*d.* to the woman. Piece work.

The rate of payment for threshing is rather less than in Prussia.

85. The examples selected from the two preceding provinces will suffice to indicate the modes and details of paying the agricultural labourer. It is only necessary, in regard to other provinces, to give the computed value of the labourers' aggregate receipts and to note any striking variations from the preceding examples.

In Posen the farm servant receives a computed annual value of 10*l.* 10*s.* to 13*l.* 10*s.* Meat is seldom allowed. The married farm man receives 18*l.* to 20*l.* a year. Piece-work and threshing are paid about the same as in Prussia. In Posen.

In Brandenburg wages are about the same as the higher rates of Pomerania. The immigration of labourers into the province begins in May. When piece-work is not possible, the men, women, and maids are paid 9*d.* a day, and receive rooms, wood, and potatoes free. Brandenburg.

In Silesia the man receives a computed annual value at the lower rates of 9*l.* to 10*l.*, at the higher rates of 10*l.* to 15*l.*, and the maids correspondingly. Half a pound of meat is allowed twice a week. Here the farm labourers are chiefly married. The wages of day labourers are low. Piece-work is much more cheaply paid than in Pomerania. Silesia.

In Saxony the man receives a computed value of 18*l.* to 20*l.*, and the maid 17*l.* to 18*l.* Half a pound of meat is allowed three times a-week. Here, too, there is a considerable immigration of labourers. Saxony.

Piece-work is paid as high as in Pomerania.

86. In Westphalia there is great variety of wage. In Münster provincial district the wage is high and the board very good. Meat is generally allowed every day, and on many farms beer is given. Coffee is allowed morning and afternoon. The wages of a man are from 3*l.* to 7*l.* 10*s.*, of a maid 3*l.* to 4*l.* 10*s.* On the smaller peasant properties the wage is rather less, but the man gets a pair of boots and three shirts, and the maid a pair of shoes and flax for two or three chemises. Coffee and meat are not allowed every day, but otherwise the board is very good. As it is the local custom to wash linen only twice or thrice a year each person requires a good stock. Hence, also, this is a reason for payment in kind taking the form of shirts. In other provincial districts the annual value of the labourer's income would be less. Westphalia. Diet. Wage. Linen.

In some departments there is a state of relations which exist from time immemorial. The labourers have contracts of four to twelve years and live in scattered houses round about the farm. The house consists of three to four rooms, stalls for one or two cows and pigs, threshing floor, and garrets. A quarter of an acre of garden land and 2½ acres to 3 acres of tillage are attached. For all this they pay 3*l.* to 3*l.* 15*s.* a year. They are Contract labourers.

bound throughout the year to work on the farm of their landlord; without board, the man woman or maid for $2\frac{1}{2}d$. He is allowed a draft animal for ploughing, if he do not use his own cow. As a rule he is bound to keep one cow and fatten one pig. This kind of position is said to be favourable and even comfortable, and is often inherited from generation to generation.

Piece work.

Piece work is better paid than in the East, and threshing is usually paid in money at the rate of 6*d*. per bushel of rye, and 3*d*. per bushel of oats. Mowing is paid higher in the manufacturing districts. In this province there is a yearly emigration for haymaking and harvesting to the Rhine and elsewhere.

In Rhineland.

Wages.

Diet.

Payment in kind.

87. In Rhineland wages have considerably risen. Wherever manufacture preponderates, there they are specially high. As a rule the wages of the man vary from 6*l*. to 12*l*. according to his position as well as the district, and of a maid 3*l*. 15*s*. to 6*l*. 15*s*. also according to her position as well as the district. The board is good, and as in Westphalia, coffee and meat are daily allowed, and on Sundays here and there, two dishes of meat are put on the table. Towards the hills the wages are lower. In places, where very low wages are paid, an allowance of clothing is made. Thus a man receives 1 pair of boots, 1 pair of shoes, 2 pairs of linen drawers, 1 linen jacket, 2 shirts, 2 pairs of stockings, 1 cap, and 1 necktie, being together of a value of 36*s*. to 45*s*., and a maid receives a value of 24*s*. The board is, however, good, and it is seldom that meat is not given twice or thrice a week. In the coal districts the wages have risen with the wants of life.

Contract labourers.

The contract or annual labourers, not forming part of the farm household, are paid on the average 1*s*. a day in summer, and 10*d*. a day in winter, with house-rent free; or 1*s*. to 1*s*. 3*d*. a day, paying 3*l*. 12*s*. for the house. But the rule is to give no house or garden land, or keep of cow. In the district of Bonn and some others, the wages are 10*d*. to 1*s*. 3*d*. with board, or 1*s*. 7*d*. to 1*s*. 10*d*. without board in summer, and 5*d*. to 6*d*. with board in winter. Moreover, the year through without board, the wages are often 1*s*. 3*d*. a day.

Day labourers.

The day labourers have partly a small property which they either cultivate themselves or their family and dependents cultivate.

Piece work.

Piece work is for example paid; for reaping, binding, &c. 4*s*. 6*d*. to 6*s*. 9*d*.; for grass mowing, 4*s*. 6*d*.; for clover mowing, 3*s*. 9*d*. per acre, and for threshing $4\frac{1}{2}d$. to 5*d*. per bushel.

Facilities to hold land.

Into this province there is a large immigration annually of agricultural labourers. The greatest facility exists for a day labourer to become a land occupier either by purchase or lease. Unfavourable crops, especially failures of potatoes, and reduced work in manufacture, places such of these occupiers as are of little intelligence in straits, so that their condition changes much from year to year. But in general this class of the population is placing itself in a correspondingly better position.

General remarks.

88. Very few general remarks are required upon the income of the agricultural labourer. Wages have risen everywhere, and the inference is that farming has improved, and the position of the labourer has been bettered. The rise in the price of food has not had as great an influence on agricultural wages as on manufacturing wages of the town workman. It will, however, have been noticed that the well known fact of the influence of manufacture and its resulting increased density of population recurs in the provinces of Prussia. In all parts the agricultural labourer appears to be contented, and complaint and dissatisfaction have only occurred in East Prussia and Silesia, where in 1846-48 various extraordinary circumstances, scarcity, &c., combined to depress the condition of the labourer. For information in respect to other facts in connection with the position of the agricultural labourer, I beg to refer my readers to pages to of Mr. Petre's "Report on the Labouring Classes."

Contrast of north-east and south-west.

The difference between the mode of payment and services of the agricultural labourer in the north-east and south-west of the kingdom will have been observed. In the former the chief feature of labour is the employment by contract for a year or more of unmarried or married farm servants, and of families provided with houses on the property. In the latter, the free day labourers preponderate. Such labourers in the olden times could only exist in the towns. Now, as has been seen, they form an important element of the agricultural labouring population. It will be remembered that a reference to the laws affecting the labourer was reserved for this portion of the report, but this subject, however interesting, must, as being incidental to the main subject of this Report, now fall out. But mention must be made of the extra-legal attempt to prevent untoward relations between farmer and labourer, in which the law is powerless to intervene to the advantage of either party, by founding institutions for specially instructing the agricultural labourer. In pursuance of this idea many orphanages and refuges have been founded, in which the

Institutions for teaching agriculture to peasantry.

inmates are taught agricultural labour. Prussia thanks Pestallozzi and Fellenberg for originating such institutions.

(β.)—*Their Social Condition.**

89. It must be conceded that during the last fifty years the relations of agricultural labour have been greatly improved. The diligence and self-consciousness of the labourer have increased considerably. But he has yet much to accomplish. The three chief accusations against agricultural labourers were immorality, drunkenness, and thieving. In Dr. Lengerke's inquiry in 1849 these accusations were not made in the western provinces and in parts of Saxony, but they did not fail in other provinces. At present the north-eastern provinces are still open to these accusations. But this is not the result of moral depravity. It is owing to defective knowledge and education, and is a remaining result of their former unfavourable condition. The system of contract labourers, under obligation to bring one or two other labourers into the field, is in some measure responsible for the immorality, inasmuch as the one or two, so to speak, gang labourers were usually girls who lived in the same room as the family. Spirit-drinking is seldom restricted by considerations of health or of economy. The heads of farms know this weakness, and use it to spur the labourer to greater diligence. In a few districts the Catholic priests have succeeded in winning over the labourers to total abstinence. The disposition to thieve is not uncommon. The harm of it consists in being found out. This disposition is also a regrettable relic of the former days, and its justification is still based by the labourer upon the pleas that the owner is living in ease and that he is not injured. There is also a good deal of jealousy and distrust amongst themselves and of the landowners and their families.

Cause of vices.

Children are not carefully tended and reared. The wives are obliged to work daily throughout summer and autumn, and on many properties in winter also. They go very early to work, are free half an hour before mid-day to prepare the dinner and do other household work, and return to work till sunset. The children come badly off. Often there is no older child to take charge of the little ones, who are consequently left to themselves in the house. A direct result is the great mortality of children. From 1858 to 1861 there died in the province of Prussia, out of a population of 2,190,072, an annual average of 21,290 children under one year, and of 40,845 children under ten years, being 0·97 and 1·86 per cent. of the population. Whereas in the Rhine province, with a population of 2,112,959, the per-centages were 0·57 and 1·12 respectively. The difference is in the ratio of 7 to 4.

Children.

The education of the agricultural labourer is defective, and he has no sufficient inducement to retain what he may have learnt. Often two or three families live in the same small dwelling, sometimes with only one room for sleeping, living, and cooking in. These labourers are seldom thrifty. Few men and yet fewer women have any idea of housekeeping. They live from hand to mouth. The humble prosperity of the family depends upon the kind of wife, other things being equal. If she be not a good manager, the wolf is always at the door.

Education.

Over-crowding.

The agricultural labourer lives and dies a mere day labourer. He knows he cannot change his lot. How different all would be if he saw even before his eyes the opportunity of acquiring a plot of land by the exercise of economy! The proof of this is repeated in the numberless examples which in this respect are offered by the Rhine province and other districts with minutely subdivided land. Thousands of agricultural labourers, who formerly had not a single inch of soil, have, by a period of economy, purchased house and a plot of tillage.

Influence of sense of property.

His religious consciousness is suppressed. It could not display itself when he was a kind of marketable ware and not a free man. The Church will have to bring special influences to bear upon him. Adult schools must be provided. Nurseries for children must be established. People's libraries should be cheaply founded. Early marriages should be discouraged. And last, but not least in Dr. von der Goltz's enumeration of remedies, the increase of small landed proprietors and of landowning labourers should be promoted. Their labour is cheaper than that of the usual contract and annual labourers.

Religion.

Remedies.

This description of the agricultural labourers of the North-east of Germany forms the extremity of the social scale of agricultural population. The references to the western provinces will have indicated the much better social condition of their labourers. From them, through the various classes of small proprietors, the dark colours rapidly fade out.

Disappearance of these evils in higher grades.

* I am indebted to the able pamphlet of Dr. von der Goltz, on "The Agricultural Labourers of North-East Germany," for this account.

(*g.*)—*Supplementary Remarks.*

90. The first will be as to the buildings of the agricultural population. The German custom, as old as Tacitus, of placing the farm-houses and farm-buildings of the agricultural district, according to a regular plan, within an acre or two of land, and each farmstead detached with or without a small house-garden, is widespread throughout the kingdom, and has been already noticed in referring to the outward arrangements of the land. It arises probably from the ancient idea of property in land, according to which only the house was separate property and the land was common property. There are also the isolated farmsteads of Westphalia and the Lower Rhine, and the aggregation in irregular villages of the houses and buildings as in the "close villages" between the Rhine and the Elbe.

The following Table gives various details of interest in connection with this subject:—

	Prussia.		Pomerania.		Posen.		Brandenburg.		Silesia.		Saxony.		Westphalia.		Rhineland.		Kingdom.

Comparison of provinces.

With regard to buildings the assessed annual value can be taken to represent more nearly their true value than the returns of land and its cultivation. It will be observed that the agricultural house has, in Brandenburg, an average value of about 3 guineas, and in Silesia of about 2*l*. Between these extremes, Rhineland, Pomerania, and Prussia come with about 50*s*. each. The average number of inhabitants in an agricultural house is the highest in Posen, at 10·1, the lowest in Rhineland, at 6·0. Thus, the value per person of the house is rather over 4*s*. in Posen, and over 8*s*. 6*d*. in Rhineland. The number of houses per square geographical mile is lowest in Prussia with 317, and highest in Rhineland with 1,476. In all these particulars the contrast between the north-east and the south-west is maintained. With regard to farm-buildings, Brandenburg seems to be best provided per farm-stead, whereas Westphalia is badly provided. As regards cattle of all kinds, Prussia has per house 8·9 head, Rhineland has only 2·8 head. But per farm buildings, the largest number of cattle are in Westphalia, with 6·8, and in Pomerania, with 6·4, and the least number in Rhineland, with 2·4. Rhineland has, however, the greatest number of farm buildings per square geographical mile with 1,720, and Pomerania the least with 433. If these comparisons could be followed out in various provincial districts, the differences would have been yet wider.

It is evident that the large proprietorship and the small proprietorship have much to do with these differences, and so has the density of population. But many of the numbers contradict the general inferences from such premisses. Why, for instance, has not Westphalia at least double its number of farm buildings? It can scarcely be due only to the preponderance of grazing over stall-feeding.

Dwelling-houses.

The question of dwelling-houses is one of immense importance, but cannot find place herein for due treatment. Neither is it possible to enter into details of the domestic plan of the houses and the farming plan of the agricultural buildings of the cultivating population. It would require much space to comment upon the interesting and multifarious information in the preceding Table.

Land credit.

91. The second set of supplementary remarks refers to the question of agricultural credit. I had made various notes with the intention of treating this important branch of the subject with some degree of fulness; but the land credit question, with its needs and projects must be left on one side, and the pecuniary condition only of the agricultural classes be touched upon in a few sentences.

Labourers.

The pecuniary condition of the agricultural labourer has been stated in giving the details of his income, and in recording that he is often able to buy land. As regards the smallest proprietors, who are occasionally day labourers, they can obviously obtain but little assistance by credit. Their circulating capital must be increased by their economies, and that capital consists mainly of their own labour and attention.

Small proprietors.

The small proprietors enjoy a certain amount of credit, and they seem to use it to about the same degree as the large proprietors. The total amount of land debt to land value has been already estimated, in this Report, at one-half; but from other accounts it can be estimated at two-thirds. This proportion, taking the whole Kingdom, seems to hold good in the opinion of several competent persons, both for the large and small proprietors. There exists, however, a difference in the causes of incurring debts on the land. The small proprietor incurs them chiefly to secure equal portions for his children without actually subdividing the land. He also incurs them frequently in the first instance, in order to buy his farm; and his tendency is to buy as large a farm as he can, instead of buying a smaller farm and retaining a larger amount of circulating capital. In this respect he has, however, the too frequent example of the large landowner. On the other hand, the large proprietor seems to incur much mortgage debt, in order to pay off family debts or to maintain a certain social position. Hence the indebtedness of the large proprietor often represents permanent loss and is not extinguished, whereas the indebtedness of the small proprietor generally represents temporary needs, and is extinguished in course of time. Economically the former indebtedness is often unproductive, and the latter indebtedness is generally reproductive. The small or middle proprietor, who remains with the family land gives a mortgage, usually at ten years, to each brother and sister for their portions as in an equal or unequal division of the inheritance shall not be discharged by accumulations of the father invested in other things than land. The cases appear to be comparatively rare in which the smaller or larger proprietor gives a mortgage for the purpose of obtaining circulating capital.

Proportion of land debt.

Causes of debt.

Raising circulating capital.

It is usual in respect of agricultural tenants to covenant in the lease for a deposit equal to one or two years' rent. This is, by the way, the exact reverse of a hanging gale. Tenants raise money on personal credit, but, so far as is generally known, the farmer who leases a good-sized farm does not require to raise any portion of circulating capital. There are no special facilities for obtaining circulating capital either for the large or small proprietors or the tenant.

Middle and small proprietors.

As a class, the middle proprietors are considered to be in easy circumstances and in

many cases to be in possession of considerable savings. Relatively to the large proprietor both they and the small prporietors are in a better position in Prussia than are in England the corresponding middle and small agricultural tenants to the large proprietors. These middle proprietors and small proprietors seem to make comparatively little use of savings banks or Consols or other investments in national moveable investments, but they lend on mortgages and promissory notes and still continue in not a few cases to prefer stockings and mattrasses for their bankers. Many of these proprietors have still to pay off their rent charges for the abolition of real charges and services.

Social condition of agricultural population.

92. The third set of supplementary remarks is an extension of the sketch in the previous subdivision of the social conditions of the agricultural labourer. That sketch displays the social condition at one extreme of the social scale. The well-known social condition of the higher classes, who are usually landowners, represents the social condition at the other end of the social scale. Between these extremes the small and then the middle proprietors can be assigned their position, if it be borne in mind that the mass of small proprietors are only slightly above the social level in intelligence and habits of the agricultural labourer, and that the majority of the middle proprietors have rather less general intelligence and much less expensive habits than their pecuniary position would lead one to expect.

Small proprietors.

The small proprietor is usually exceedingly thrifty and generally free from the three chief vices of the agricultural labourer of the north-eastern provinces. He does not thieve, and as a soldier respects the watch and purse of his slain enemy. In this respect the German soldiery of Prussia even of lower station than the small proprietors voluntarily and universally follow their praiseworthy example.

Intelligence.

As a rule it may be affirmed of the agricultural population that, although rudimentary instruction is remarkably wide-spread and almost universal, yet there is much work for education, as distinguished from instruction, to accomplish. The peasants, however, lose nothing, so far as I am acquainted with them, by being compared with the corresponding classes in England.

Middle proprietors

The middle proprietors are distinguished for their liberality in religion, their conservatism in politics, their careful economy in money matters, their praiseworthy sobriety in morals, their conduct in social relations, and their practical knowledge of agriculture; but they are not distinguished as they might be for curiosity in knowledge out of their own immediate sphere of labour. The want of this kind of curiosity may not be natural, but may be artificial. It may be merely the result of the too paternal Government which till lately kept the peasant in the state of an infant citizen; and, in a generation, indolence in knowledge may be as completely shaken off as indolence in agriculture has been since the accomplishment of the objects of the Stein-Hardenberg Legislation.

Influence of large proprietors.

With regard to the large proprietors it may be added that, though they are few in number, their influence is considerable, and is for the most part beneficially exerted. Their privileged position in the Departmental representation, which is now a Parliamentary question, gives them no real influence, and as it is an offence unto the many, its reform is sensibly accepted by many, probably most, intelligent owners of privileged estates. As county counsellors ("Landräthe"), representing their Departments, the larger proprietors are generally of great service to the nation. They employ, for the benefit of the local population, an useful accumulation of instruction and higher education, and usually constitute no unimportant force in the resultant of forces, which causes Prussia to steadily progress in the development of her national wealth, and the Prussian people in the development of their national ability.

Pauperism.

Pauperism is an incident of social condition which it had been intended to treat in connection with the poor-laws of the land. But it will suffice to remark, that in purely agricultural districts pauperism is very rare, and beggars are unknown.

Monetary condition of land.

93. The fourth supplementary remark is as to the value of land. Under the heading of capital of land, it was proposed to assemble various particulars of the value of land, of its permanent and circulating capital, and of its borrowing powers, as well as of its returns to the cultivator. But whatever man may propose, time too often frustrates his intention. It will suffice to record as a fact, to which testimony is borne by all classes, that as regards the returns of land, the small and middle proprietors obtain a greater return per acre than the large proprietors. The reasons are obvious. Even if the labour of the family of the small proprietor be reckoned in the comparison, the result is the same. Moreover, the profit to the individual cultivator seems, in Prussia, to be universally larger from good ordinary farming than from high farming with expensive manuring.

Profits of small proprietors.

Taxation.

94. Finally, it had been intended that the taxation of the land should be treated in a division of this IIIrd Part of the Report. This subject, too, which does not bear so directly upon the object of this Report, must be omitted. But it may be noted that, as the indirect taxation of Prussia extracts about 6*s.* from the pockets of each person

for the actual necessaries of life, and, as a labourer earning, say 15*l.* a-year, would pay on the average for himself and family, 30*s.* in indirect taxation, and 9*s.* in class tax, the labourer of the land would be rather heavily taxed. If a person paying income-tax, say on 150*l.*, be taken for comparison, and his necessaries of life be assumed to be the same as the labourer's, then he would pay for himself and family, in indirect taxation, 30*s.*, and in income-tax, 90*s.*, and consequently would be comparatively lightly taxed. The taxation of the former reaches 13 per cent., that of the latter only 4 per cent. But the difference between the two is much greater, for even 4 per cent. to the former would, in proportion, be much harder to pay than the 4 per cent. to the latter. If only a rapid thought be given to the fact of the greater inequality in former days of taxation as between class and class, and to the existing facts of the greater demand upon the labourer for the expenses of the State, facts which are not restricted to Prussia, no wonder will be expressed that, after the withdrawal by the State of such sums from the labouring-class,* that that class does not approach nearer to other classes in its aggregate wealth. In Prussia, the agricultural labour class seems to be nearer the other classes in this respect than in some countries. Doubtless, indirect taxation in Customs' duties, or in other forms, and especially protective taxation has, in an undetermined but considerable measure, assisted in bringing about unequal distribution of wealth. Indirect taxation is often defended on two grounds; the tax-payer does not feel it, and if it were abolished the tax-payer would would not get the benefit. Even, if prices did remain the same after abolition, it would not be the fault of the State, and then no agitators could say to the labourer, that the State (in the hands of an oligarchy, or aristocracy, or middle-class, according to the notion of the agitator) extracted the money from his pockets and favoured the more monied man. If Prussia reduced her indirect taxation the labourer would, in the end, benefit. She could follow the examples of other nations, and would probably follow the further example of any other nation, reducing still more its indirect taxation. At present indirect taxation is too often everywhere, as regards its incidence upon each individual of the various classes, an upright cone resting on the paupers. If at any time the cone should be inverted, the sins of the fathers of several generations will be visited upon the children. Taxation should be either an inverted truncated cone, or at any rate a cylinder.

ıfluence on ıbourers of ıdirect taxation.

95. One word on the army. Whatever may be the actual and immediate injury which the military system of Prussia inflicts upon manufacture, commerce, and the professions, it does not seem to be so directly injurious to agriculture. Economically, it doubtless withdraws reproductive labour from agriculture; but, on the other hand, it sends the agriculturist back to his agriculture a better and a wiser man. This interesting question of the undoubted advantages of the army as a school for the nation is too large to be now treated. Possibly the loss of reproductive labour is compensated to the nation by the gain in physical and moral qualities of the peasant and artisan. But, when the nation is thus educated and trained to a higher grade, this set-off will cease. If then swords are turned into ploughshares, the nation will not regret the loss of reproductive labour. In the meantime, the agricultural population furnishes the strongest soldiers, and provides, as compared with the manufacturing population, soldiers in the ratio of nearly 2 to 1. And it is from the yeomanry and peasant proprietors that a great portion of the military strength of Prussia proceeds. Indeed in most agricultural districts it is a distinction for a man to have been a soldier; and, although it may not bring the returned labourer higher wages, it certainly invests him with an important precedence, even in equal claims for work.

rmy and agricul- ıre.

(E.)—*General Observations.*

96. I have very small qualifications for venturing to make any general observations in summing up the chief facts connected with the agricultural conditions of land in Prussia, as presented in this part of the Report. I am only slightly acquainted with the theory, and I am quite unacquainted with the practice, of agriculture. Yet, I hope that any such observations which may occur in this division will not be altogether useless or valueless.

97. It will be observed that Prussia, with scarcely 50,000,000 acres for plough and grass land, has a greater agricultural area than Great Britain probably has with, if I recollect aright, 57,000,000 acres of aggregate area. In the British agricultural statistics of a few years ago only 45,000,000 acres were accounted for. In most parts of Prussia no space, or very little space, is lost by the subdivision of the land into fields by hedges, banks, and ditches. The gross available area therefore is rarely more than the actual

griculture mpared.

o space lost.

* No doubt the rate of wages was, and is, thereby affected, and therefore a part certainly, but the whole doubtfully, of this difference is in reality paid by the wage giver and not the wage recipient.

available area. In England, on the contrary, the difference between landlords' measurement and the available area is frequently more than 10 per cent. But this is by the way. It is impossible to compare the aggregate produce of the two areas. Their relative productiveness may be inferred, if the returns of wheat be taken as a standard. The average return of wheat in Great Britain is 9 to 1—a proportion which is considered by many to be humiliating to our science. Now, I believe that the Prussian farmer usually sows about three bushels per acre. As can be seen from the Tables of gross produce in paragraphs 37 to 45, the average maximum return of wheat in any district is 12 to 1. This maximum return is, however, rare. From a due consideration of the frequency in those Tables of the various ratios and of the areas to which they belong, it may be safely inferred that the average return of wheat for the Kingdom of Prussia is much under 9 to 1. Hence it would seem that the productive area of Prussia yields less return relatively than the productive area of Great Britain. On the other hand, the inference might be in favour of Prussia, if a comparison of the climatic conditions, and of the proportion of favourable to unfavourable soils, in each country could be made. It is also impossible to attempt to compare the two countries in respect of high and low farming. But really high farming occurs rarely except in connection with the beetroot sugar industry. At present high farming does not appear to be relatively as profitable in Prussia as medium farming. This may arise, but ought not to arise, from expensive experiments or from serious mistakes. But, until the really high farming is shown unmistakably to be more profitable than medium farming, the peasant proprietor will not adopt it. He cannot afford the luxury of maximum crops at a less return to himself. The success of high farming must depend upon two indispensable conditions—that of a sufficient demand for the maximum crops, and that of a relatively lower cost of production,—the selling price remaining the same, which it would probably not do. It is not, however, within the scope of this Report to try to ascertain whether or not these two conditions are so universally satisfied in Prussia as to warrant the expectation of universal high farming. Medium farming seems to be better and more careful than the medium farming of England. This, at any rate, can be noticed, that the average farming of the less-acred middle proprietor is more careful than the average farming of the corresponding tenant farmer in England. This applies in the main to the small proprietor also, who has a cow or a couple of cows or a team of oxen or a horse for farm work. The gardening cultivation is renowned for its care and intelligence.

High farming.

Medium farming.

98. It will probably have been inferred by the reader that the parallel drawn in paragraph 46 between the farming of large and small proprietors, in respect mainly of rotation crops, did not show unfavourably under the circumstances for the latter. It must be borne in mind that the small peasant proprietor is usually restricted to the narrow knowledge of his immediate district. Moreover, he wisely—it would be dangerous to his small livelihood to do otherwise—mistrusts his ears, and places confidence alone in his eyes. The large proprietor does not need to have knowledge brought to his door and experiments to be made at his threshold. He must be naturally expected to lead the way in improvements of cultivation. There are exceptions, but, as a rule, the small proprietor readily adopts an improvement, the success of which he has watched from first to last. Some middle proprietors, whose incomes are already more than their needs, are slow to adopt changes, and prefer, like some small proprietors, to cultivate as their ancestors cultivated.[3] In other districts the conditions are such, that the peasant proprietors cannot abandon the old three-field system of cultivation. I am also informed that agricultural progress is generally greater where equal division on inheritance of the property obtains than where the custom is to pass on the farm undivided from father to son: but this requires verification, Moreover, there seems to be but one opinion as to the comparatively larger returns from small than from large farming properties. Association will probably enable the small farms to hold their own in this respect too, in spite of expensive machinery and of intensified cultivation.

Parallel between large and small proprietors.

99. As to the system of farming it must be acknowledged that the details hereinbefore given do not suffice to appreciate, as a whole, the system in Prussia. Possibly an agriculturist could infer from the general physical conditions, geographical position, and the customary rotation of crops of a given district (as already given in this part of the the Report), that the farming is economically managed or the contrary. But I am incompetent from such data to say, that the Prussian farmer has well distributed his farm work throughout the year and advantageously selected his crops. Inasmuch as the chief object of cultivation must be not only to diminish the cost of production but to prevent exhaustion of the soil, and as in this respect the rotation of crops is one method of doing the one and preventing the other, the details on this point will, it is hoped, be of some use. It will be noticed that the due preparation of green and grain crops is not always kept; but

System of farming

then details as to the use of manuring and to the preparation of the land for restoring the balance fail. In respect of management of grain crops the Prussian farmers are, as a whole, in advance of most farmers, but our farmers have certainly an advantage in respect of quality and, to a certain degree, of management of live stock. Yet the Prussian farmer has more frequently perceived the benefits of stall-feeding for cattle than the English farmer has. Is this due to the fact of proprietorship in place of tenancy and to the fact of comparative smallness of the farms? The small farmer in Prussia could seldom pasture cattle, but by stall-feeding his cattle are more numerous and his manure is relatively to his land in greater proportion than on the large farm. A chief defect in Prussian farming is doubtless the relatively small number of cattle. One cause of this is that there has been no extensive market for meat, or rather that the farmers have not sufficiently appreciated the importance of producing meat. This defect is, however, being remedied; and greater attention is paid to the quality of the horned cattle, especially since sheep, solely for woolgrowing, have become comparatively of little value.

Agricultural progress.

100. As to agricultural progress one great fact is evident. That progress is enormously indebted to the extinction of rights of common, especially to the commutation of the prejudicial common of fallow and stubble pasturage. It is obvious that a large part of the agricultural progress of Prussia must be ascribed to this portion of the National Agriculture Legislation. Indeed, the assertion in the previous part of this Report, that all the progress of Prussia must not be attributed to the regulation of property relations and the commutation of real charges, is confirmed by inquiries into the agriculture past and present of Prussia. Then, too, the influence of the development of means of communication has been visibly great. It would be difficult in Prussia, where so many national improvements have been advanced hand in hand, to separate this influence from the influence of other forces of progress. But what that influence has been, as a whole, in Prussia, can be estimated by considering the enormous benefit, which that almost isolated improvement has, in spite of the retention of many obstructions, conferred upon a country like Spain. Neither must the valuable results of land improvements be forgotten. Nor must the intelligent activity of the State, of the local authorities, and of the voluntary associations be omitted in accounting for the agricultural progress of Prussia. Nor, lastly, must the fact be forgotten, that the operation of the Stein-Hardenberg Legislation has been coincident with the evolution of agricultural prosperity from a state of devastation caused by war. The removal of feudal restrictions enabled the nation to take advantage of every beneficial influence, and the conversion of all kinds of tenures into absolute ownership enabled the nation to derive the greatest benefit from such influences, and thereby to increase most rapidly in solid strength. These two may be looked upon as the great preliminary causes of Prussia's rise, without which no such an advance would probably have been made. The Auxiliary Legislation and the remainder of the National Agriculture Legislation may be considered as most directly and materially assisting in her progress; whilst an intelligent collateral legislation, the rapid rise of her industry, and the universal increase of national prosperity, have combined to render that progress conspicuously remarkable.

Parallel of tenants and proprietors.

101. As to an agricultural comparison of tenants and proprietors, it is regrettable that no materials are at hand for instituting one. So far as I can learn, such tenants, agriculturally considered, fall into two main categories, which comprehend nearly the whole body of tenants. The first category consists of tenants of large estates, public or private, and the second category of tenants of quite small farms or plots of ground. Of the farmer the best tenants are the Crown tenants. Many of them belong to a class of tenant families. They have usually prospered enormously, and some of them have founded wealthy landowning families. This prosperity has not, however, been due entirely to their superior intelligence and knowledge. It is in all probability to be attributed in a large measure to the very low rents at which some Crown estates were leased. The introduction of public bidding has taken away this advantage from the Crown tenant. A notable instance of the increase of Crown rents will confirm the observation. The lease of such an estate recently fell in, and the rent which had formerly been about 2,000*l.* was run up to nearly 10,000*l.* The highest bidder was the farmer tenant! But, apart from this consideration of rent, the tenants of the first category are generally men of superior knowledge and great intelligence, who have frequently studied in an agricultural academy, and they employ the best mode of cultivation during, at any rate, the greater portion of their long lease of 18 to 24 years. A lease of 12 years is considered to be too short for a good tenant; for 3, if not more years, are lost in, and even 10 years are sometimes required for, bringing the land into good cultivation, and then during the last three or more years it is to the interest of the tenant to obtain as much as possible out of the land, and to put as little as possible into the land. No comparison can therefore be instituted

Leaye of twelve years too short.

between proprietors and tenants of twelve years, for the former have evidently the advantage, and in a series of years their cultivation will be better both for the land and for themselves, than the cultivation of the latter. This is said to be an observed fact in Prussia. Permanent tenants, except the above-mentioned Crown tenants, are rare. Usually the tenants even of this first category are tenants only until their savings are sufficient to buy a farm. Their interest in the land is therefore less than that of the above-mentioned Crown tenants. As regards the tenants of the second category, it is only necessary to notice those who subsist solely by their agriculture. These have too frequently shorter leases than twelve years. The opinion is decided that they are inferior to proprietors in their agriculture. Finally, it must be recorded that a considerable number of the tenants of this category are proprietors as well as tenants, and are obliged, in order to keep their holdings, to become tenants, because no land is to be purchased.

Land and capital disproportionate.

102. As to the evil of holding too much land, that is an agricultural defect in Prussia, as it is in England. If it be true that two-thirds of the tenant-farmers in England hold too much land for their capital, that is a serious set-off against the alleged advantages of tenant farming over proprietary farming. In Prussia this defect is to be observed in respect of the large owners in many districts, and in respect of the middle owners in East and West Prussia. Elsewhere it is not so frequent, and its reaching a proportion of two to three on an average of the kingdom may be doubted. Amongst the small owners it is also unfrequent. On the other hand, it must be acknowledged that there is a great tendency to purchase land out of proportion to the circulating capital, and to retain land in excess of circulating capital. The personal observations in the fifth part of this Report will probably offer more exact information on this point. It is, however, much to be regretted that time has not permitted of carrying out the intention of inquiring into the capital of land. It must, however, be now noted that, in any comparison of the agricultural progress of peasant proprietors with that of the larger or formerly manorial proprietors, into which of course the question of circulating capital enters, the important fact must be borne in mind, that during the last half century the peasants have paid large amounts for commutation, and the lords or their representatives have received them.

Peasants have paid and lords received commutation.

Distribution of land.

103. As regards the distribution of agricultural land, it has been seen from the preceding paragraph 15, that of alienable lands the peasant team-requiring farms and the small holdings, possess about a half. This applies to Prussia less the Rhine province. If the peasant proprietorship of the latter had been added, it would probably have turned the scale in favour of these two classes. If too the larger properties of yeomen had been taken out of the calculation of large properties in contradistinction to peasant team-requiring farms, the independent peasant proprietors would probably have been found to preponderate in acreage within the kingdom, bs they already do in numbers and importance taken together. The contrast between the 1,000,000 agricultural proprietors of Prussia and the 30,000 farming proprietors and 250,000 tenant farmers of Great Britain is startling. Such uncontradicted assertions as that one-half the land in England is in the hands of under 200 individuals, and in Scotland of a dozen individuals, are incredible to Prussian ears, and betoken, to Prussian authors and others an unsound agricultural organization. It is not, however, desirable to occupy space in this Report with quotations from the many treatises in which the institution of an independent yeomanry is shown to be practically wise and economically advantageous. But it may be affirmed that public opinion is in Prussia entirely in favour of her present agricultural organization, and that in no rank of society, or office, or learning, or politics is there any visible minority in favour of the totally different organization which dominates in Mecklenburg, and resembles in some respects that of England and Ireland. The opinions of treatises of political economy and statecraft may be summed up in the words of Roscher in his "Nationalökonomik des Ackerbaus":—

"A mingling of large, middle, and small properties in which the middle predominate, is the most wholesome of national and economical organizations. That much," he says, "can undoubtedly be taken for granted." Prussia also takes it for granted, and rejoices in the knowledge that she possesses without any alarming tendency towards an unwholesome alteration that wholesome mingling of properties. In some countries the divergence of the nation from the philosopher is more or less widely marked in respect of this important matter. In Prussia the nation and the philosopher are one, and such an unanimity transforms the more usually applicable apophthegm into

"*Homines* MULTI, UNA *sententia.*"

Part IV.—Miscellaneous.

1. This Part will contain, in the first place, brief answers to the questions asked in the list which accompanies Lord Clarendon's "Circular" No. 263 of August last; and, in the next place, one or two topics to which that "Circular" refers, but which have not found a place in the preceding Parts.

(A.)—*Brief Answers to Questions.*

Land Occupation.

2. Tenants are the exception, large and small proprietors prevail. The tenants are to the proprietors as 1 to 20, and the farming tenants to the farming proprietors as 1 to 40 only.

Vide paragraphs 200 and 201 of Part II in particular, and the subdivision *(d.)* of division (C.) of Part II in general.

Vide also paragraphs 78 and 79 of Part III.

(A.)—Small Proprietors.

Answer to question 1.

3. The quantity of land held by each varies much. In respect of the smallest proprietors, *i.e.*, those whose holdings do not exceed 6 acres, of whom there are probably about 750,000 (one-half being in Rhineland alone), the average for the Kingdom is probably less than 3 acres. In Rhineland the average would probably be less than 1 acre. A property of from 7 to 30 or more acres, according to Province, climate, soil, and local position, suffices to support a small proprietor and his family. Of these there are probably another 750,000 in the Kingdom. These round numbers are inferred from the dates this Report.

The land was generally held in separate portions by these and all other proprietors, excepting where the enforced primogeniture applied to peasants also. But, with the exception of Rhineland, this separation of portions of the holding has been to a great extent replaced by compact tracts of land. This has been effected by the compulsion to consolidation in connection with the extinction of rights of common. The remaining intersected land will be consolidated in all probability by a similar compulsion, without reference to rights of common. But no such an advantageous consolidation has as yet been carried out in Rhineland, where there has been much opposition to it.

Vide paragraphs 69, 75, and 169 of Part II, and paragraphs 3, 4, and 20 of Part III.

To question 2.

4. Everyone can make a will and dispose as he likes of his property, except of the quantity required to satisfy the claims of the "natural heirs" ("Notherben"), and of the property entailed or settled, either in *fidei commissa* or in accordance with the laws of feudal or similar descent. In cases of intestacy the law divides all property, including land, in certain proportions, amongst widow and children, or equally amongst the children if there be no widow. But the laws of intestacy seem to have little application, for the custom of making a will is almost universal.

Vide paragraphs 103, 104, 112, 115, 119, 120 to 123, 125, 128, 193, 195, 197, and 198.

Mr. Hertslet writes:—"When a man dies (intestate?) all his property, including land, is divided equally amongst his children."

To question 3.

5. The proof of title has hitherto been a recital of all the entries respecting the property in the Land and Mortgage Registers—in many cases a costly document,—which did not after all render the title indefeasible. As soon as the Bills now before the Chambers become law, the entry in the Land Register will give an indefeasible title. The cost will be, as regards the registration, from $\frac{1}{10}$ to $1\frac{1}{3}$ per cent., according to value, and is as regards to stamp 1 per cent.

Vide paragraphs 145, 146, and 149 to 151 of Part II.

To question 4.

6. There are no such special facilities afforded either by Government or the Provincial Governments, and it cannot be said that special facilities are afforded by special public companies or banks (of which there are none aided by Government), except so far as the Mortgage Debenture Associations and the Mortgage Banks are specially established for the purpose of granting loans on properties of whatever size. The raising of such loans is subject to all the usual commercial incidents. The Rent-charge Banks, instituted for facilitating the carrying out of the Stein-Hardenberg Legislation, are of course an

exception. Loans are raised seldom for circulating capital, and, amongst middle and sm a proprietors, mostly for paying portions to the children without dividing the land. The quite small proprietor cannot thus raise money, and is compelled to subdivide the land itself for the inheritances of his children.

Vide paragraphs 115 and 209 of Part II, and paragraphs 64 and 91 of Part III.

7. The land debt of the Monarchy is estimated at more than one-half of the land value. Of this debt only 22,500,000*l.* are owing to associations of a more or less public nature, and the remainder, of from 335,000,000*l.* to 353,000,000*l.*, is owing to private lenders. Respecting the amount lent by the associations there are few statistics, and they do not suffice to answer the question. But, so far as partial statistics go, the peasant properties do not seem to be as heavily mortgaged as the privileged properties ("Rittergüter"). To question 5.

By other accounts there is no difference in this respect between the two classes of property, and the land debt is two-thirds of the land value. The rate of interest varies from 4 to 6½ per cent. on small and less favourably situated properties. The quite small proprietors cannot dispose of mortgages.

Vide paragraphs 208, 209, and 214 of Part II, and paragraph 91 of Part III.

8. This is answered in paragraph 5, for soon the entry in the Register will alone create a mortgage. To question 6.

9. They still retain in several parts the three-field system of winter corn, summer corn, and fallow, either naked or occupied with green crops. But in most parts they have modified this system into a four or five course, and in many places their rotation is on advanced principles. It must be recollected that, as long as they were subjected to the common practice of fallow and stubble grazing, they were hindered from improving their system of farming. Wherever they practise the so-called garden cultivation, which is usually spade husbandry, they manifest an advanced mode of cultivation. Stock are usually stall-fed and seldom pastured. The pastures disappear after extinction of commons and consolidation of the holdings, for tillage is then more profitable. To the total area of the Kingdom the proportions of tillage and grass land are 51 to 4 and 16 to 9 respectively. In many Provincial districts, however, the proportion of tillage to grass land is much more than 3 to 1, and may be even 8 to 1. The quite small proprietor has seldom any pasturage, and the middle and small proprietors seem to prefer stall-feeding to pasturage whenever it is practicable. To question 7.

Vide subdivisions (*c*), (*d*), and (*f*) of division (C.) of Part III.

10. Agricultural machines, with the chief exception of threshing- and drill-machines, are little used. The quite small proprietors cannot, of course, afford to substitute machines for their own manual labour. The small proprietors of 10 acres (and more, according to Province, climate, soil, and local position), who can afford to keep a general farm servant, cannot afford such machines. But even these are beginning to associate for the purchase or use of machines. The middle proprietors in the more advanced parts usually employ drill-machines, but as yet have few steam-machines for threshing. They have, however, a considerable number of whim-machines for threshing. To question 8.

With regard to the proportion of labourers to proprietors, there is an important difference between the various Provinces. In Pomerania the ratio is more than 3 to 1, in Prussia more than 5 to 2, in Posen and Brandenburg about 5 to 2, in Saxony rather less than 5 to 2, in Silesia and Westphalia 2 to 1, and in Rhineland the number of proprietors and of labourers engaged in agriculture are about equal.

The employment of hired labourers can only occur in the case of the middle proprietors (*i. e.*, holding from 20 to 400 acres). Pabst, the great German authority for such matters, reckons one labourer per 8 acres as necessary for a medium farm cultivated on ordinary principles. In Prussia, however, there is one labourer per 7 acres on the better managed farms. If the farming is high, the number of labourers is of course increased. The average number to the acre may, however, be taken to be 0·143 within the Kingdom. Female labour is everywhere the custom, and forms two-fifths of the labour employed. The wages vary considerably throughout the Kingdom, and are given with some details in subdivision (*f*) of division (D) of Part III.

Vide that subdivision, also paragraph 68, and subdivision (*c*) of division (C) of Part III.

11. An inconsiderable number only of the agricultural labourers emigrate out of the Kingdom and leave Europe for America or elsewhere. Wherever the proprietary peasantry are in large proportion there seems to be no such an emigration at all, not even a temporary emigration out of the district into another part of the Kingdom, unless manufacture had disturbed the agricultural equilibrium. To question 9.

12. As an almost universal rule, they, both small and middle and also the large To question 10.

proprietors, live in villages and towns. This custom, to which Tacitus refers, has its advantages and disadvantages. The chief exceptions are in Westphalia, where isolated farms exist. They always live on their property, for the house in the village or town belongs to the land. It is not unfrequent for a village to contain no house without its plan of the land belonging to it.

Vide paragraph 90 of Part III.

To question 11. 13. Relatively in these respects to other classes in Prussia, they are generally well housed, fed, and clad. There is, however, great variety, according to the Province. Absolutely considered, their houses could be improved, but their diet is good and their clothing is respectable. The quite small proprietor has another occupation than agriculture. The small proprietor engaged solely in agriculture has to work hard, but is in unstraitened circumstances, and is, as a class, placing himself by his thrift in a better position. The middle proprietors (of less than 200 acres) are usually doing very well. The owner of 50 acres and under is well to do. The owner of 20 acres is in comfortable circumstances. Their standard of living is decidedly economical, but relatively good.

Vide paragraphs 74, 76, 82, and 88 of Part III.

To question 12. 14. The acre is too small an unity to take. The square geographical mile which in the Tables represents 14,278 acres, is better for comparison, and is common to all countries.

In Rhineland there is of small and middle proprietors an average of 1,400 per square geographical mile, of which the small proprietors represent 1,200; or in other words, one to ten and twelve acres respectively. In the provincial district of Coblentz there is an average of slightly over two per acre, and the small proprietors represent the full two.

In Pomerania there is of small and middle proprietors an average of 160 only per square geographical mile, of which the small proprietors represent 107, or one to 90 acres and 135 acres respectively.

In the provincial district of Stralsund the numbers are slightly above these averages. The contrast is enormous. The proportions for each other Province rank themselves between these extremes.

As to relative increase of population the small and middle proprietors very rarely marry early. On the whole they seldom marry before 30 years of age, whereas the unlanded labourer marries on the average at 20 years. The family of a small or middle proprietor (under 100 acres) often consists of two children. In many (I believe in most, if not all) agricultural districts of small and middle proprietors the persons under 16 years and above 16 years are equal in number. The population is frequently stationary as soon as the land is owned by as many families as it will support. The fact of the facility for owning or hiring land, as the case may be, has usually a similar influence on the labourer. The proprietary labourer is usually as prudent as the small independent proprietor. The difference in these respects between the manufacturing labourers and the lower agricultural classes is everywhere most marked. Other details on this subject will be found in the 5th Part of this Report. I have no materials for comparing the increase of the small proprietary agricultural population with that of other countries.

To question 13. 15. The prevalent public opinion is decidedly in favonr of peasant proprietorship. It is also generally in favour of small proprietorship, of which the advantages are held to outweigh the disadvantages. The conversion of all feudal tenures and relations into absolute ownership and freedom is considered to have been the only possible solution of the problem at the beginning of this century, which could have enabled Prussia to increase so rapidly her national wealth and the welfare of her people. For this Prussia will ever be grateful to the many sharers in the Stein-Hardenberg legislation, who through many difficulties have in that manner solved the problem.

(B.)—Tenants and Sub-Tenants.

To question 1. 16. The quantity of land varies much. There are apparently very few middle tenants. Either they are holders of large farms or of small and very small farms. In the latter category usually fall the tenants of the lands of the communalty, which are frequently in rather small portions. There are no statistics to enable this question to be answered in figures. If any statistics be obtained in the districts visited, they will be set forth in the 5th Part of this Report.

Vide also paragraph 78 of Part III.

To question 2. 17. This is fully answered in subdivision *d* of Division B of Part II. Leases are the rule and are usually long. The landlord's consent is required to sub-letting. Tenants

and sub-tenants can only assign in virtue of contract with the owner. If there be no covenant to sublet, they cannot assign. Tenants at will, or from year to year, cannot of course assign.

Vide also paragraphs 132, 199 of Part II.

18. This is fully answered in subdivision *d* of B, Part II. The law continues the tenancy from year to year subject to this, that the tenant must be allowed to finish his rotation of crops. Hence the law usually protects him for three years if needs be, and the tendency is to protect him for as long as the period of rotation may extend. The smallest holdings are very rarely let for less than three years, so that parol agreements scarcely ever occur. To questions 3 and 4.

Vide paragraphs 132 and 133 of Part II.

19. There are no such laws, and there seem to be no such customs. But there is, however, in one, if not more districts, a system of letting by valuation, but with its details I am not at present acquainted.* To questions 5 and 6.

Vide paragraph 79 of Part III.

Rent.

20. Rarely by a proportionate share of the produce, occasionally by a fixed quantity of produce, often by a rent, part fixed in money and part fluctuating in money. To question 1.

Vide paragraphs 133 and 202 of Part II.

21. Rent is usually regulated by competition under the form of the customary value of the district, but the practice of public bidding seems to be wide-spread. It is due quarterly by law, and usually half-yearly by lease. No hanging gale exists. But it is usual, at any rate in respect of any but very small portions of land, to require a deposit equal to one or two years' rent, which is the exact reverse of a hanging gale. To question 2.

Vide paragraphs 133 of Part II and 79 of Part III.

22. The landlord can, unrestricted by law, raise the rent as he chooses, subject, of course, to the covenants of the leases which are universal. The law in Prussia has had no need to look into the exercise of a landlord's power in this respect, for the custom of agricultural leases has prevented any abuse of it. But, as the law protects the tenant, it would no doubt have protected him against any abuse of that nature. It has done so in the case of the feudal peasantry, who correspond to the descendants of the customary tenants now on Irish land, for it converted them into absolute owners, whereas British law has allowed the Irish customary tenants to be converted into tenants at will. To questions 3 and 4.

Eviction is accompanied by judicial incidents. It is practically a law suit, and is rather a difficult one.

Vide paragraphs 138 and 203 of Part II.

Evictions.

23. These questions are answered as fully as the text books of Prussian law answer them, but I may be able to include some further information in Vth Part of this Report. It is not a summary process, and the tenant can appeal. To question 1.

Vide paragraphs 138 and 203 of Part II. To question 2.

24. It is seldom resorted to, and chiefly for deterioration of the soil, for which purpose powers are sometimes reserved in a lease. Usually the tenant is free to farm as he may please. It will be recollected that the feudal peasantry of Prussia are now absolute owners, and not mere tenants from year to year, subject to summary eviction as in Ireland.

Improvements.

25. The buildings, and sometimes the stock of all kinds, are let with the land, as was the case in olden England. No tenant ever builds without a perfect understanding as to compensation with his landlord, and is seldom, if ever, obliged by the requirements of his farming to build. He is not forced either to make the necessary buildings or to be deprived of his living or to emigrate. The landlord cannot be forced to pay for improvements made without his sanction, unless of course, they were ordered by the State. To questions 1 to 4

Vide paragraphs 133 and 135 of Part II.

26. This is answered in the foregoing paragraph 6; for the remarks therein apply equally well to tenants except of course that they cannot raise money on mortgage. To question 5.

Miscellaneous.

27. The relations between landlord and tenant, being universally based upon long leases, cannot be said to be unfriendly, although, from its being to the interest of the tenant, the tenant may frequently try to obtain the largest returns at the least outlay from the land, and thus act to the dissatisfaction of the landlord. But the tenant has generally such opportunities of being an independent and land owning farmer, that no comparison in respect of enmity or friendliness can be instituted between the Prussian and the Irish tenant. Both in circumstances and feelings the two could be contrasted, not compared. To question 1.

28. As regards the smaller farmers there appears to be no essential difference in these respects between tenants and proprietors. The tenant, however, becomes usually a proprietor, as soon as he has saved enough money. The land of the small proprietors is said to be in a better general state throughout a series of years than that of the small farmers, with leases of six or even twelve years. A lease of three years is of course no protection to the land. To question 2.

* Since this was written I have learnt that this system has been replaced by the system of letting by public bidding.

To questions 3 and 4.

29. There are no means of answering these questions 3 and 4, from general statistics, for the tenants form merely an unimportant part of the national economy. If any local or special information should be obtained, it will be found in the 5th and concluding Part of this Report.

To question 5.

30. Public opinion is decidedly in favour of long leases and against short leases, and, *à fortiori*, against tenancies from year to year or at will. As regards a comparison between a tenant farmer and a gentleman farmer, or between a number of tenant farmers and a gentleman farmer cultivating the same land, the means are not at hand for instituting it. It is frequently said to be in favour of letting. The fact that there are more persons capable of taking small quantities of land, than there are capable of taking large quantities of land, accounts partially for the greater advantage to the owner in the latter case. The want of capital in the owner often accounts for it in both cases. Moreover the owner, when he lets his estate, omits to take into the calculation of the advantage to him the excess of his personal expenditure over that of the tenant farmer, or over the aggregate expenditure of the tenant farmers, and also his loss by experiments or unnecessarily expensive farming.

To questions 6 to 9.

31. The questions 6, 7, 8, and 9, are fully answered in the Report. Before *1807*, there was scarcely any free holding or rather absolute ownership in the Kingdom, either for noble, townsmen, or peasant. By the legislation inaugurated by Stein and Hardenberg, the noble's lands, the tradesmen's lands, the yoeman's lands, and the peasant's lands were converted into absolute ownership. Prussia, in ridding herself of the trammels of the feudal system, erected into a principle of State policy the creation of absolute holdings. Hence all tenures of the old system were gradually abolished. Apart from this legislation it cannot be said that Prussia has taken any special means to secure a large number of freeholders. Public opinion is in favour of the present system and attributes much of Prussia's prosperity to the grand fact of the enormous preponderance of proprietors of land over tenants of land.

Vide sub-division *a*, of division B, and also paragraphs 225 and 226 of Part II, and paragraphs 74, 92, 93, and 95 of Part III.

To question 10.

32. This is answered in the foregoing paragraph 6. There is no need to assist tenants by laws to become proprietors, for a half of the land in private hands in Prussia is held by a very numerous body of proprietors and is subject to the greatest freedom of exchange, and the largest proportion of that half is in estates of a size within the reach of the majority of farmers. The desire to acquire land is very strong. From this fact and the fact of more competition for moderately sized estates, the smaller estates have relatively a considerably higher value than the larger estates. It would seldom be profitable to a large landowner to annex such small estates.

To question 11.

33. The laws in force certainly tend to bring about the dispersion of land, by the prohibition of creating fiefs, by the encroachments on the perpetual nature of entails, by the influence of the obligatory inheritances and by promoting the greatest freedom of exchange. What the influence of that tendeney, which has apparently been small, has hitherto been, can be gathered from the γ section of C, *a*, and paragraphs, 207, 209, and 210 of Part II, and also from paragraph 75 of Part III.

To additional question.

34. There are no tenures resembling copyholds. The former tenures in Prussia resembled copyhold, inasmuch as the feudal tenant or semi-proprietor was irremovable at will by the lord of the manor; but, whereas copyholds are in England* usually so-called encroachments upon the rights of the lord of the manor, these tenures were in Prussia usually encroachments of the lord of the manor upon the right of the yeomanry and peasantry.

35. The preceding paragraph concludes the series of brief answers to the questions in the List, inclosed in the Earl of Clarendon's Circular No. 263 of the 26th of August last. It would seem that the only subjects, to which Lord Clarendon called attention in the above-mentioned Circular despatch and which have not been treated of in the course of this Report, are the subject of the management and appopriation of timber, and the subject of a comparison between tenants and proprietors in respect of "character, social conditions, and system of farming, and their respective influences upon the development of the agricultural resources and general welfare of the country." This latter subject can only be undertaken after I have accomplished my intended visits to a few characteristic districts; and even then it will be a meagre comparison, for it is not easy to find collected in any one district a preponderating number of tenants under large proprietors. The former subject will now be briefly treated.

* This seems to be the view indicated in the additional question to the List of Questions in the Earl of Clarendon's Circular despatch; but it is often held that the copyholders (customary tenants) reentered into the rights of former Anglo-Saxon peasant proprietors. If this be the right view, then the contrast in the text must be replaced by a parallel.

(B.)—*The Forests of Prussia.*

36. Germany, at any rate North Germany, was formerly covered with forests, and cultivation of the soil was a war upon the forests. The history of the occupation of the forests as property is interesting, but cannot be now related. But it is curious to learn that they were early appropriated as possessions in common in connection with the land communities. From this historical fact sprang the many rights of common affecting forests to the present day, when with other commons their extinction was decreed. From this fact there sprang the custom of cultivating the forests in common, which still obtains in some parts of the Kingdom. The wood and timber possessed value at a very early date. The legislation shows the attention, which was passed even in the Middle Ages, to the trade in wood and timber. Frederic the Great endeavoured to substitute a regular course of management for the system then in practice. But his decree, based upon a geomaterical system, did not satisfy the existing conditions of forest cultivation.

Forests early in common.

Succession of improved systems of management.

Silesia in this, as in some other legislative and agricultural matters, set an improved example of forest management. By it most of the objections to the former system were removed, and a more equable return was obtained. Then followed, towards the end of the last century, a system adopted in Pomerania and the Margraviates which allowed freer cultivation without abandoning a due control, and thus advanced beyond the Silesian system. At the same time many excellent forest regulations for the improvement and protection of forests came into force. Various decrees towards the end of the last century and beginning of this century embodied the principles and details of a good forest management. The body of Prussian law recognizes a regular course of cultivation, and the due economical protection of the forests. Neither did the State neglect to provide for the education of competent forest managers. A monopoly of wood and timber obstructed the advance, and the great wars of the beginning of this century hindered the development, of forest management.

37. From the Peace of Vienna the subject received great attention, and the treatment of forests was much improved. By the new legislation, as applicable to the six Eastern Provinces, there appears to be no direct control retained over private forests, but the forests of the communalties are subjected to a prohibition without the previous sanction of the State either to cut down wastefully the wood or to convert the forests into plough land or meadows. In the Western Provinces the predominating system of communal and associated forest management was little changed. But the French Legislation had introduced a strict superintendence and due intervention of the State in the cultivation of the forests of communalties and other corporations, and the utility of this system was so freely recognized that it has been substituted for the ancient system.

Present legislation.

Each corporation retains the administration of its forests, subject to the superintendence of the Provincial Government. They must cultivate according to a system approved by that Government, and must employ duly qualified forest managers, and must obtain previous sanction for any extraordinary cutting of timber and for sales, &c. This system of administration obtains also in the Province of Saxony. The communal law of 1856 provides that communalties can be ordered, after due hearing of their council and of the departmental council, and on the ground of an urgent need of the national cultivation, to bring uncultivated communal ground into cultivation by planting trees or laying down meadows. In 1858 the right of demanding that such a measure should be carried out, was granted to the various communalties under certain conditions of numbers and interest. At the same time a similar attention was paid to the instruction of technical managers of forests. Not least has been the influence of the extinction of servitudes of forest*—a too complicated and difficult subject to be treated of here. The collecting of windfallen wood is granted by tickets at certain rates, which at the discretion of the forest administration can be reduced for very poor persons. Grazing in its various forms is seldom let to the highest bidder, but a moderate rent to the inhabitants of the forest district. The grazing of cattle and sheep is rarely permitted, but the grazing of swine is as far as possible promoted, as it is considered advantageous in diminishing the number of insects in the forests. Whenever tracts of land more fitted for tillage or meadows than for trees occur in the forest, they are let for these purposes to the highest bidder. Of the total area of forests, nearly 4 per cent. is thus used.

Economy is shown in turning to pecuniary advantage berries, plants, &c., to be found in the forests.

* As to these, equivalents of housebote, ploughbote, hedgebote, firebote and many other forest commons and servitudes known to English Law can be found amongst them; but others unknown to English Law also exist. I recollect hearing in Austria of a common of vending in forests, various communalties having the right to cut down and sell for their own advantage a certain number of trees in the manorial forests.

Area of forests.

38. The area of forests is as follows:—

	Acres.	Of Total Area of Forest.
State	4,779,460	27
Communalties	2,364,268	13
Institutions	147,948	1
Private, &c.	10,575,012	59
Total	17.866,688	100

Productive and net Returns.

The classification of the forests for the land-tax was difficult, and is interesting, but cannot be given in this brief review of the subject of forests. Neither is it possible to enter into the details of the production; but the following Table will give the main points of production and net returns:—

Provincial Districts.	Total Area of Forest.	Total Production.		Land Tax. Net Return per Morgen of Forest.	To average Net Return of Tillage.	Population per Square Geographical Mile of Area of State.	Per Head of Population.		
		Per Morgen.	Total.				Of Area of Forest.	Of Net Return of Forest.	Approximate Annual production of Wood.
	Morgen.	Cubic ft.	Cubic feet.	Sgr.	Per cent.	No.	Morgen.	Sgr.	Cubic ft.

The State forests yielded a real net return two and-a-half times the land-tax assessment. If this proportion be taken for all forests, the true net return is 24,250,913 dollars, or 3,642,640*l.*

Dr. Meitzen, from whose work the foregoing particulars have been extracted, has based them upon the complete work of Herr von Hagen, respecting "The Forests of Prussia."

39. The foregoing observations will probably suffice to give the information required by the reference in Lord Clarendon's Circular despatch to the "Management of the Woods and Forests." But it is not clear to me in what directions it was desired that information should be gathered. It is, however, clear that it is impossible to enter into the principles and details of forest cultivation, and of forest protection, without adding considerably to the bulk of this Report. But one general observation may be permitted. So far as I can gather from the numerous evidences of the activity of the State, and the governing authorities, there has been, and is, a minute and intelligent care exercised both in regard to forest cultivation and forest protection. It will also be recollected, that there has been a beginning in the direction of replanting forests for the beneficial protection of

districts, as witness the Forest Law of Wittgenstein, referred to in paragraph 92, and the notice of the replanting of forests in the Eifel, in paragraph 186 of Part II.

Results of Prussian experience.

40. If it be desired to ascertain what are the results of the experience of Prussia in the management of her woods and forests, or what are the principles on which that management is based, then time and space only permit of my offering, in addition to the remarks already made, the few following observations :—

Krug,* who wrote at the beginning of the century with great ability and much clearness and in simple German upon economical subjects, recognized on the one hand the unavoidable defects of State administration of landed estates; and on the other hand, the fact that the administration of its forests by a State was more advantageous than letting them. This lies in the nature of forests with their very slow returns. By, however, exercising a strict control, and by interesting the forest officials in the amount of profit, the inherent defects of the State administration can be, and are, as much as possible, diminished. A portion of the State forests has been sold, and it is evidently to the interest of the State to sell whatever portions involve disproportionate expenses. The practice of cultivating the remainder on account of the State, shows that nothing has occurred to reverse the opinion held by Krug, and based upon the previous experience of Prussia. Public opinion seems rather inclined to extend the intervention of the State, for, as a rule, corporate and private woods and forests are not so well managed as those of the State, to at any rate all corporate forests, and to desire that the State should have a strict superintendence or even management of them, accounting to each owning body for its share in the proceeds. The reasons for a careful management, and an intelligent preservation of forests, are not only the necessities of the nation in respect of firewood and timber, but the important connection with the welfare of the nation which forests undoubtedly have, by their usefulness "in maintaining the equilibrium of warmth and moisture, in feeding gently with water the brooks and streams, in affording them protection against the glowing sun, in breaking the force of storms, and the arresting the prejudicial driving of snow and sand." But this intervention of the State must not of course take the harmful form of the last century, which the National Agriculture Edict abolished; it must be restricted to compelling in one manner or another the most intelligent cultivation, and to preventing wasteful destruction. The best method of doing this is by no means easy to discern. But of its necessity there can be no doubt. Moreover, a district once denuded of forest, is often deteriorated for ever. There are parts of the province of Saxony where it is impossible for private persons to restore the woods, and where the district must continue to suffer, until a method shall be found of benefiting the district at the common expense against the obstructiveness of some individuals.

As to the protection of the forests by law, the various police regulations constitute a body of very numerous and even minute provisions for their preservation against abuses of all kinds. They cannot of course be epitomized, neither can they be now enumerated. There is also a special law for the punishment of stealing wood or any other products of forests.

(C.)—*The Agricultural Loan Unions.*

41. These, which in agriculture correspond to the Schultze-Delitsch unions in industry, deserve a special notice. By means of associations of all kinds it is considered that all the disadvantages of small properties can be and are removed. It is the case of the bundle of sticks once again; each is separately weak, but all are together powerful. Such associations exist mostly in the Rhine Province. They provide agricultural implements, cattle, breeding cattle, machinery, &c. Of the general kinds of associations, however, no further notice need now be taken. But of the so-called Loan Unions ("Darlehenskassenvereine") it is desirable and will be interesting to give a short account, together with the opinions which are held concerning the principles involved in them.

Raiffeisen Loan Unions.

These Loan Unions have sprung from the benevolent efforts of a practical man to provide the small proprietor, without capital and credit, with the means of purchasing cattle and of obtaining other stock which he may require, and also to enable the labourer to purchase his house and buy a plot of land. Herr Raiffeisen, who has devoted his time to this object, established the first Union in Flammersfeld for the purpose of meeting a temporary need. The number increased to five in the neighbourhood, and within the last two years the unions have rapidly spread. Some original imperfections have been removed from the system, which is now known as the Raiffeisen system, but there are still adverse critics of parts of the scheme. The unions differ in some essential points from the Schultze-Delitsch unions.

* Krug belongs to the more advanced thinkers of the transitional school. He scarcely acknowledged all the principles of the modern school, then in its infancy.

Usury.

42. Herr Raiffeisen, who has laboured in the Neuweid district, is impelled by a kind-hearted desire to liberate the peasant proprietors from the curse of usury, which, with Frankfort as its centre, has been unscrupulously carried on by Jews in many a district radiating therefrom. With this view he lends money at the lowest possible interest; but it may be doubted that his unions, excepting by occupying ground, effect much in this direction; for the peasant who can be duped by the usurer will close with the usurer's first offer of 3 per cent. rather than pay 7 or 8 per cent. to the unions, and the peasant who knows the wiles of the usurer will reject all overtures from him. It is, however, painful to read what a terrible leech the usurer can be. This is an instance from Herr Raiffeisen's account of his unions. A owed B 45 dollars, the remaining instalment for the purchase of a horse. B required cash before A could pay, and therefore sold his claim to one of the well-known traffickers. This latter then compelled A to buy for 41 dollars a cow worth scarcely 20 in order to gain time. This cow had to be slaughtered, and in half a year A was compelled to buy from him another cow at 46 dollars, feed it for nine months, and sell it him fattened for 25 dollars. After five years of this usurious dealing A owed about 250 dollars. He must now sell his horse, but, failing this, he pawned it to another trafficker for 80 dollars. This one sold the claim to another, who carried out the policy of trafficker No. 1. In the end the unfortunate A was of course entirely ruined. Thus in five years a debt of 45 dollars became, by this mode of dealing, 250 dollars, and eventually brought about the ruin of the debtor and his family. It is especially in cattle that the usurer does his chief business. In some villages nearly all the cattle belongs to the Jews.

Object of such Unions.

43. If the differences, as well as the resemblance, between the small landowning cultivator and the artizan be considered, the necessity for the deviation of Agricultural Loan Unions from the Schultze-Delitsch Unions will be at once recognized. In both cases the question is how best to assist the labouring classes, who live chiefly by physical labour, to obtain the necessary credit for advancing in their operations. It has become evident that this can best be accomplished by ceasing to consider men as isolated individuals, and by associating them on the principle that the interest of one is the interest of all. Hence the Dagon of self-interest may soon be unexpectedly found to be dashed to pieces on the floor of his gorgeous temple. Fellow-feeling ("Gemeinsinn") is the ark of the covenant. But such a principle must, as in the Loan Unions under notice, be combined with the vigorous maintenance of that other powerful principle; viz., that each labourer is entitled to the fruits of his own diligence and industry. Hence the German upholders of such Unions reprobate as harmful the attempts of some English Trades Unions to bring to a level the earnings of all members of the same class by limiting the gain and consequently the industry of the more capable and diligent workman. Such a mistaken procedure retards the progress of true fellow-feeling. To state, however, that fellow-feeling and not self-interest should be the corner stone of a national economy is only stating, in other words, that, as Friedrich List has well put it, more attention should be given to the producing forces than to the resulting produce. The reverse has too often been the case. Ireland is unfortunately no exception, inasmuch as the economical principle of maximum produce has not seldom been pushed to an extreme limit—even to the exclusion of maximum producing forces whenever both have not been equally ignored. It has been forgotten that sound political economy recognizes (to descend to a specific instance) not only the benefit of maximum crops, but also the advantage of numerous cultivators. Without, however, being tempted into an inquiry (according to the light of many German authors) respecting the serious defect of the national economical organization of the age, it is interesting to notice that these Unions, in recognizing the principle of fellow-feeling, acknowledge also the advantage of numerous cultivators, and seek by removing the disadvantages of the smaller proprietary cultivators to enable them to hold their own against all adverse influences. They also seek to remove another evil which afflicts society, that of large portions of the population condemned to daily labour throughout their whole life without the possibility of possessing property and of thus being rendered better citizens. This evil is, of course, not fully recognized, so long as the labourer is considered as one piece of the machinery by which a given product is obtained for the general wealth. But, as soon as he is considered as a man, it becomes of importance to implant in him a manly independence, and this can probably be best effected by giving to him the possibility, and holding out to him the hope, of being an owner of more than the muscles which God gave him, and the air which men scarcely allow him. But the wage labourer suffers not alone from the defective economical organization; the whole social fabric also suffers and is endangered. In the industrial organization of Prussia the intervention of a proprietary class between the large manufacturer and the wage-receiving class is much needed, but not more so than in other countries. Happily for Prussia the intervention of such a class between the large landowners and the wage labourers is a fact in her agricultural organization. If the main object of State

Policy should be to increase the proprietary class and to diminish the non-proprietary class, then any sound voluntary association which assists the operation of State policy must be of great importance to the State. In this respect Agricultural Loan Unions are an object of interest and the Raiffeisen Unions are of importance, for they have for their aim to support and increase the less monied portion of the proprietary class.

Self-help.

44. The Schultze-Delitsch Unions are, as is well known, founded upon the principle of self-help. That self-help is, however, planted not only by the labourer himself but by aid of important assistance from beyond his sphere, as witness the praiseworthy devotion of Schultze-Delitsch himself. Associations resting upon self-help have frequently arisen with the help of the directly unbenefited and more monied classes. This is no reproach, but a cause for congratulation. Yet the complaint that the Raiffeism associations have relied upon outside capital comes with an ill grace from upholders of the useful industrial unions. Indeed, the doctrine of love for one's neighbour must act in harmony with the principle of self-help. There is no valid reason for shutting out the capitalist from co-operating if he will. Has he not his duties towards humanity?

Necessary differences between Industrial and Agricultural Loan Unions.

The task of Agricultural Loan, Unions is, as has been already remarked, different from the task of Industrial Loan Unions. The most important part of the task of the latter is to interpose a sound middle class between the large manufacturer and the mere wage labourer. This forms no part at present of the task of Agricultural Unions in Prussia. Neither is it necessary for them to be schools of economy to precede Producing Associations as in the case of Industrial Unions. The agriculturists to be helped are mostly owners and producers on their own account. The Agricultural Unions must also be more restrictedly local than the industrial unions; but this does not hinder them from obtaining by a central body the benefits of centralization. Moreover, the stability of Unions founded upon an agricultural basis must be less fleeting than that of Unions founded upon an industrial basis. Last but not least is the fact that the member of the Agricultural Union has a natural savings' bank in his land and that, if the Union assists a member to acquire a plot of ground, it likewise provides him with the best form of savings' bank.

General principles of Raiffeisen Loan Unions.

45. The Raiffeisen institutions are associations for obtaining capital from those who have and lending capital to those who have not. They are associated banks, but they do not bank for the profit of this or that person. The whole benefit is received by all the members. No banking profit is levied, and hence the more monied members do not gain in a different proportion to the less monied members, as is the case in most unions where the former invest by contributions in the association. It is better that the profit should remain in the pockets of the peasant members; consequently the aim of the institution is only to charge as much interest as will pay the interest of the borrowed capital, and repay the actual costs of management. The guarantee of such unions is by the joint liability of all members to the amount of all their property, for it is evident that mortgages upon their small properties would not always offer a sufficient guarantee. As in the Schultze-Delitsch Union, the members only can receive advances of money. This is a principle which must ever be firmly maintained, otherwise the unions would lose all appearance of self-help and become merely benevolent institutions. But, contrary to the Schultze-Delitsch principle, unsalaried work is accepted in the Raiffeisen unions. It must, however, be recollected that the latter are restricted by local, and seldom if ever occupy by their accounts much of the time of their officials. Hence there seems to be no reason for refusing to allow persons of the district with leisure from performing as honorary labour the necessary work of the unions. Why should the man of leisure be prevented from thus manifesting a little love for his neighbour? Local men who have the confidence of their neighbours are fitted for managing such unions. With the exception that the above difference necessarily makes, there appear to be no important deviations in administrative organization from that of the Schultze-Delitsch Unions. The Raiffeisen form of accounts seems to be simple.

Important difference between Schultze-Delitsch and Raiffeisen systems.

An important difference between the Schultze-Delitsch and the Raiffeisen Unions must be noticed. In the former there is the excellent arrangement by which the member, who receives the benefits of the institution, becomes a partner in the banking business of the institution, and is raised thereby in the economical scale. In fact his interest in the institution is increased by the retention of part of his profit to form the reserve capital, and his saving is stimulated by his partnership. In this manner the advantages of a sense of property are provided for the artizan.

In the agricultural loan unions—at least in the more recent forms of them—this arrangement does not exist. Neither does the prime necessity for it exist, for the members are usually already proprietors. Hence the members do not become partners in a business, and their profits are not partially retained as savings in the institution. Indeed even the

contributions of members are not insisted upon, although the entrance fee is usually and at any rate should be retained. It is true that the most needy and deserving of help may be unable to pay an entrance fee. But the danger of an improper use of the facilities of the union by persons admitted without any fee or contribution, is a greater evil than the possible exclusion of a few of the most needy. Moreover, a compromise might be effected by subjecting the entirely destitute applicant to two conditions of acceptance; viz., the sanction of the association and the obligation to pay by instalments during the first year an equivalent entrance fee (or fee and contribution) to other members, as soon as he shall make use of the facilities of the association. Such payments would of course be carried like the present payments to the credit of the reserve capital or fund. This reserve fund is accumulated at compound interest until a certain fixed sum is obtained, when (and not until then) its income is at the disposal of the association for benevolent purposes, and in case of a dissolution of the association the capital is at the disposal of the association for the general benefit of the community. In the Raiffeisen institutions great weight is laid upon this indivisible reserve fund. It consists naturally in only a small degree of profit, for as has been already noticed, it is not the intention of the unions to make a profit for themselves. Whatever little profit is made would be of *little* use *divided* amongst the members in groschens, whereas, retained in its bulk and accumulated, it may in course of time become a considerable fund, which can be used for the greater benefit of the community. It is, however, a benefit not for this generation, but for the next, and will be of great use to the then poorer members or neighbours. There is also an interesting idea in connection with the future use of such reserve funds, viz., that of establishing producing associations in districts where the agricultural population has also an auxiliary occupation in some small industry. In this case such associations would arise from capital solely and slowly accumulated by pure self help. Such an example of patient perseverance would be a rejoicing right. This result and this practical proof of fellow-feeling is more possible amongst the steady going small peasants than amongst the variable artizans. Moreover, the future members of the agricultural associations will probably be the immediate descendants of the present members, and by waiting the latter know they are benefiting their own. This is not the case in regard to members of industrial associations, who have seldom a settled home for generations.

The preservation of the Raiffeisen principle of the indivisibility of the Reserve Fund* depends, of course, upon the will of the association. It is an impossibility to insure its preservation: but its rejection at any time is rendered as difficult as possible.

mercial risks of ffeisen Unions.

46. Looked at from a commercial point of view, the Raiffeisen institutions run great risks. They lend on long terms, and borrow on short terms. They also operate almost entirely with borrowed capital, instead of with a nucleus of capital of their own. Pure banking may be conceived, and may be seen in Prussian savings' banks, as operating entirely with deposited capital, yet in ordinary practice there must be the guarantee of an unborrowed capital. It may, however, be held that, as in the guarantee of savings' banks, these unions by the joint liability of the whole property of each member—all for one and one for all—offer that unborrowed capital in such property as their guarantee, and that consequently they can commercially operate with borrowed capital. But the first commercial risk cannot be thus diminished, If they borrow on short terms, they ought mainly to lend on the same short terms, but they usually lend on far longer terms. It requires no imagination to foretell the result at a time of commercial difficulty if the greater portion of the capital lent to the unions were called in. On the other hand, however, the two institutions, with a fifteen or twenty years' experience, have prosperously survived the commercial difficulties of that period. It is also affirmed that there has hitherto been no difficulty in replacing capital which has been called in. But the institutions do not develop and spread as rapidly as might be wished. The reason of this lies probably in the difficulty of obtaining working capital. The admission of moneyless members without the obligation of a contribution is in this respect no advantage, but a disadvantage to the credit of the union. A project for obtaining the necessary funds by a central union was started; but was on deliberation abandoned. Another project was to obtain funds from mortmain; but this did not succeed. This difficulty of obtaining capital may, therefore, render their development slow. But if a crisis in the existing unions should cause their dissolution, the members will not be worse off than before, and most of them will have benefited much in the meanwhile. But the risk incurred by lending on long terms still remains and constitutes an imperfection which is not seen in the Schultze-Delitsch unions, for these are based on the soundest commercial principles, and only lend for short terms, even if they borrow on longer terms. The difference

* Vide paragraph 99 of Part V for further remarks on this Reserve Fund, and the Raiffeisen Unions generally.

between the needs of the artizan and of the small peasant proprietor is, however, such that unions for the latter cannot lend on short terms. The short credit of three months may suffice for the shoemaker, who quickly turns his money; but it does not suffice for the cultivator, who must wait months, perhaps years, to get a full return for his outlay. The agricultural loan unions must give long terms. even of five or ten years. It is, in fact, the difference between permanent and circulating capital. The cultivator mostly requires the former, the shoemaker mostly the latter. The small cultivator has no banks or institutions from which to obtain it, except in so far as the savings' banks may be willing to lend to him on his personal security and that of two sureties. Even these may not always give him the necessary assurance against the recall of the money at an inconvenient time. A greater assurance must exist when the money is borrowed, as from the unions under review, for a given term of years. The unions, however which lend at five or ten years have generally borrowed their capital at three months. It must, on the other hand, be noted that each union makes a careful valuation of the immovable property of its members, and never borrows beyond one-half of such valuation, and that, for the emergency of capital being suddenly called in, the right to call in all advances at four weeks' notice is reserved.

Agricultural Unions must give long credit.

It may be permitted to an observer of the Unions to notice that the plan of redeemable debentures appears not to have occurred to the speakers at the meeting which pronounced a central association impracticable for the present. The irredeemable debentures were rightly considered as impossible; the borrowing of capital at three months' notice was pronounced an evil. But the intermediate plan of debentures redeemable at one year, or at end of five years, or at end of ten years, and bearing a higher interest for the longer term does not seem to have been discussed. Yet such a plan with the necessary facilities for registration of the value of the property of the Local Unions, of transfer to order or to bearer, coupons, &c., would seem to be quite practicable. It is not impracticable that such debentures could be placed in suitable proportions of each category to prevent the Unions from being hampered in their long terms of lending. The debentures might either form a lien upon the specific property of a given Local Union or, better still, upon the aggregate property of all the associated Unions. The true principle of insurance would thus be maintained.

47. The 5,093 loans of the fifteen Unions which have arisen in the period 1850 to 1868, and of which only two date from before 1860, amount in the aggregate to nearly 40,000*l.* No losses occurred to the great majority of Unions, a small loss of 18*l.* to one, and no return has been made from another Union. As regards the latter, the Flammersdorf Union, which is the oldest, I am informed that no loss was incurred. Their reserve funds do not yet reach in the aggregate 2,000*l.* The interest charged, which includes, as I understand it, a sum of 5 per cent. for costs spread over the whole term, has varied from 6 per cent. to 7 per cent. for five years, from $5\frac{1}{2}$ per cent. to $6\frac{1}{3}$ per cent. for ten years, and from $7\frac{1}{2}$ per cent. to $8\frac{1}{3}$ per cent. for three months. The members number about 4,000. The loans made vary in amount from 15*s.* to 150*l.*; the average amount being about 8*l.* The costs of administration have been about 600*l.* for an aggregate of fifty-two years of administration; that is to say, in respect of each year, about 12*l.* for each 800*l.* of loans made, or $1\frac{1}{2}$ per cent. The loans can of course be repaid at any time in whole or in part before the end of the period fixed for re-payment. The loans were made to meet a temporary need as well as to supply permanent capital. The latter took the form of live stock and implements and also of acquiring land or a house.

Statistics of Raiffeisen Unions.

It is unnecessary to epitomize now the statutes of such a Loan Union; but the materials are at hand for giving a more minute description of this form of association, if it should later be considered desirable.

(D.)—*Remarks on various Subjects.*

48. There are several subjects which require notice before proceeding to the concluding part of this Report, but which do not now need a sufficiently extended treatment to warrant a separate division for each subject. It is purposed to refer briefly to them in this division.

The reader will not fail to have perceived how frequently the principle of association has presented itself in the course of the investigation recorded in this Report. It meets us at the outset, and only parts from us at the close. It flourished in the earliest periods of German history; it is growing lustily in the present age. But the ancient manifestation of it differs materially from the modern manifestation. Then it consisted in denying property to the individual. Now it consists in denying property to the community. Then it generally consisted in sharing in common the fruits of capacity and incapacity, of

Principle of association.

diligence and indolence. Now it consists in leaving to each individual the fruits of his capacity and diligence, and in sharing in common the risk of purchasing advantages for each individual of the community. Such are (to keep within the area of this Report) the associations for the erection and maintenance of dykes, for the regulation of rivers, for reclaiming land, for irrigation, for water meadows, for forest cultivation, for purchases of agricultural machines and implements, and of live stock, &c., for obtaining credit by union for each creditless individual, and for other similar purposes. In this way the evils of individual isolation can be remedied without having recourse to so-called socialism or communism. As a set-off to the evils of olden times from property in common, the modern age can enumerate the advantages of credit in common. In a word this principle of association displayed itself formerly in a community of uses, and displays itself recently in a community of wants. It would be interesting to follow the principle of association though its various phases in German history, but the inquiry would require an essay to itself.

The Savings' Banks.

49. The savings' banks have been referred to in the course of this Report. This institution is of very great value in Prussia as in other countries. It lends, as has been already noticed, money upon mortgage. But I am informed that it lends also on personal security with two sureties, and that in this manner it has conferred important benefits without incurring any losses. Although the principles of this Institution enter as little as other details connected with it into the domain of this investigation, it is not uninteresting to notice that the savings' banks of Prussia rest upon the principle of a community of wants. They are guaranteed by the department or the town, for the benefit of which they are founded. Their profits are consequently devoted to general objects connected with the department or town. In this way many buildings for the benefit of the community have been erected.

Influence of large landowners.

50. This Report would be incomplete without a reference to the influence of the large land owners. This has not been diminished by the Stein-Hardenberg legislation. On the contrary there is little dissent from the opinion that the relations of the large land owner with the population of his district have been thereby so improved that his influence is now greater than it formerly was. This is easy to understand, for his natural influence, as representing the intelligence of the district, has far more play, when the surrounding population have no interests in connection with him, antagonistic to his own. The powers for good of the large landowner should always be confirmed, and his exercise of a legitimate and natural influence should be encouraged. Accordingly, the far-seeing Prussian politian does not promote indiscriminate attacks upon the position of such landowners, which proceed from a lingering remembrance of the former antagonism of interests.

Game in Prussia.

51. Many will consider a report upon land incomplete without a reference to game. Although the scope of this report does not include the game laws, a few words on the history of the position of game in Prussia will not be without interest. In the earliest time no restriction of the chase was known. The freeman had the right to follow the chase throughout Germany. But with the development of land ownership arose, as a prohibition of trespass, the reservation of the right of chase to the owner of the land. The body of proprietors had the right in common to follow the chase in the undivided forests. Under the French Kings the rights of the chase assumed another form. The Nimrods of the day began to strictly preserve their forests, and soon all the State forests were subject to this exclusion. The small proprietor quickly found himself deprived of his original right of chase, chiefly by the necessity of the times to seek the protection of a baron by entering into feudal subjection. The next phase was general reservation of all rights of chase throughout the Kingdom to the ecclesiastical and secular grandees. These, in the subsequent granting of fiefs, retained the right of chase. In this manner the right of chase became a monopoly, or at any rate a preferential right, and the original German principle that the right of chase belonged to the owner of the land was set on one side.

The Prussian body of law recognized only the lower chase as belonging to the owners of privileged estates. All other persons in respect of the lower chase, and all persons in respect of the higher chase must duly qualify themselves under the Government monopoly for exercising the right. The higher chase consisted of deer, wild boars, bisons ("Auerochsen"), elands, pheasants, &c. Partridges, hares, snipes, wild geese, and ducks, &c., constituted middle and lower chases, or lower chase as the case might be. This system did not apply to the Rhine Province, and there were various exceptions in different provinces. The year 1848 re-established the old German principle, and abolished all monopolies and preference rights. Then each owner became free to exercise rights of chase in every respect over his property, and ceased to be under any compulsion whatsoever in regard to the chase. This freedom has been somewhat restricted by subsequent

egislation chiefly in this, that an owner must have 200 acres lying together in order to exercise the right of chase.

The following figures will indicate the capacity of the Kingdom of Prussia for sport, and will also indicate to how small an extent game interferes with agriculture. The average annual number obtained by the chase is—

Red deer	.. ..	4,288	
Roe deer	.. ..	14,204	
Partridges	.. ..	1,311,134	
Snipe ..	.. ..	13,132	
Rabbits..	.. ..	8,308	
Fallow deer	.. ..	2,546	
Hares ..	.. ..	1,097,316	
Pheasants	.. ..	2,373	
Ducks ..	.. ..	16,454	
Foxes ..	.. ..	11,524	

The last is a dreadful item, for poor reynard is ignominiously shot. The number of rabbits is small, and their damage to agriculture must be of no account. But the ravages of the marmot seem to make up for the absence of the losses inflicted upon crops by game. Two-thirds of the annual value of the chase are obtained from the hares, and one-sixth from the partridges.

It is calculated that the Prussian forests contain about 32,000 red deer, 13,000 fallow deer, *106,500* roe deer, *6,000* wild swine, 3,000 "Auer" oxen, 900 elks. Upwards of *90,000* licenses to exercise the right of the chase were issued in the year 1866-67.

Part V.—Local Enquiries.

1. Having epitomized the materials which are to be obtained, and represented the opinions, which are to be gathered from men and books in Berlin, I have now to record as briefly as possible the results of a few personal inquiries in the Provinces of Saxony, Westphalia, and Rhineland. Similar inquiries have been made by Mr. Consul White in his own consular district and in the Provinces of Silesia and Posen. The interesting record of these inquiries, which will add much to the value of the investigation of the Land Question in Prussia, will be found in Mr. Consul White's various reports. As to my own inquiries, I can only regret that circumstances prevented me from employing more than fifteen days in visiting the provinces above named. As the period of the visit was necessarily so short, it was desirable to select as far as possible typical districts in each province, and to confine my inquiries mainly to such districts. I accordingly adopted that plan, and I shall now attempt to arrange the order of those districts under certain headings in such a manner as shall best illustrate the main features of this report.

(A.)—*The results of Equal Division of Land.*

2. The equal division on inheritance of land is assuredly one of the most interesting subjects in connection with this great question. Another equally important point is to obtain some practical idea of the working of the formerly almost universal practice of the three field cultivation with field compulsion. For looking at these two points together, I selected the department of Wetzlar. All the other districts in this division of the report are districts in which the equal division of land obtains. The more special reason for the selection of each of these districts was as follows: the department of Siegen for forest and meadow associations; the departments of Bonn and Cologne for the presence of agricultural tenants; the department of Langensalza for consolidation of intersected lands, and lastly the department of Mülhausen for absence of consolidation and for unusual poverty. Each of these will be treated in a subdivision of this part, and the Provincial Districts of Coblentz and Magdeburg will be briefly referred to in another subdivision.

Special reasons for selection of districts.

(*a.*)—*The Department of Wetzlar.*

3. No better department could probably be chosen for seeing in the present day the united results of equal division on inheritance of land and of the old system of agriculture. Its simple relations and its ancient appearance carry one back three or four centuries in time. It is in all essential points unchanged. It has only been opened out by turnpike roads within the last thirty years, and traversed by a railroad within ten years. Frankfort was formerly a two days' journey. The town of Wetzlar is unmistakably old and even primitive; and one can easily understand, that a hundred years ago a Goethe, as a temporary resident, found it necessary to ward off suicide by writing a romance of love, incorporating the tragic fate of the unhappy Jerusalem.

Unchanged condition of Wetzlar.

The town of Wetzlar was originally a so-called Villa of the Frank Kings; then a free town; and after some political vicissitudes was with its territory given to Prussia by the Congress of Vienna. The department was separated by the Duchy of Nassau from the Rhine Province, but is still administered as part of the judicial district of Ehrenbreitstein. It is necessary to add, as bearing upon the observations to be now made, that the peasants

Never serfs.

were always freemen, and that the Frank custom of equal division of land has been in force from time immemorial.

(*a.*)—*Statistics.*

Population.

4. The area is nearly 10 square geographical miles. The population is stationary at about 43,000. The children under 14 years number rather over 7,000 males and rather under 7,000 females, of whom five-sixths live in the country. The population over 14 years numbers about 15,000 males and 14,500 females, of whom three-fourths live in the country. There is, however, no great line of demarcation between the urban and rural population; for even the town of Wetzlar itself is mainly agricultural. The births average 1,400 a year, and the illegitimate are 1 to 14. The balance of loss by emigration was nearly 100 in 1860-62. The marriages, mostly under 30 years, average 300 a year. The working and serving classes show the greatest inclination for early marriages. Concubinage seldom occurs. There were rather more divorces (366) in 1861 than corresponded to the average of the Kingdom. There are 4,330 owners entirely occupied, and 1,325 partially occupied in agriculture. There are only twenty-five tenants in all. About 20,000 souls constitute the families and dependents of the above. The labourers are reckoned at 2,275 with nearly 6,000 relatives and dependents. The agricultural population contains, therefore, more than 34,000 souls.

Kinds of land.

5. Of the 10 square geographical miles of territory the following is the distribution of kinds of land

Agricultural population.

	Acres.	Per cent.	Parcels.	Owners.	Acres per Head of Population.
Plough land	55,770	40·3	359,059	19,961	1·282
Garden land	1,740	1·3	26,330	8,307	0·173
Meadows and pasturage	13,248	9·6	126,635	17,692	0·301
Wood land	54,298	38·8	4,760	1,377	1·232
Roads and waters	4,172	3·0	209	121	0·096
Sites and yards	637	0·4	7,582	7,033	0·014
Waste and barren land	9,177	6·6	..	..	0·211
Total	139,042	100·0	..	..	3·309

Of the above average the State holds 3,836 acres, the Communalties 44,770 acres, and Church Corporations 8,048 acres.

Landed properties.

6. The distribution of property in lands is as follows:—

In 1858 there were	65	properties of over 400 acres.	
„ „	27	„	200 acres.
„ „	457	„	20 to 200 acres.
„ „	5,068	„	3½ to 20 acres.
„ „	15,060	„	3½ acres and under.
	20,677		

This in itself is a startling distribution of land, but if the fact that all properties above 35 acres belong to the great Salm family or to the State or to the Communalties be allowed for, the distribution is yet more astonishing. If these be duly deducted, there remain on the one hand over 20,000 properties under 20 acres and about 300 properties of 20 to 200 acres. Comparatively few possess 10 to 16 acres and are well to do. It is a rarity to find 20 to 27 acres in the same hand. The average size of a "parcel" varies from 1 to 4 chains in various parts of the department and is generally nearer the single chain.

Value of buildings and land.

7. The value of buildings and land in the Department is estimated at over 4,500,000*l.*, of which the buildings take 1,000,000*l.*, and the forests 750,000*l.* The mortgage debts are returned at about 120,000*l.*; but although in calculating the basis of taxation a deduction of such debts is made, the peasant proprietors are known to withhold the fact of such debts.

The following figures for 1851–60 will give an idea of the value of tillage and meadow:—

Land Tax.	Selling Value per Acre.			
	Tillage.		Meadows.	
	£	£	£	£
Class I	34	to 66	60	to 100
Class V	8	18	15	21

Rents on lease range from 30*s.* to 40*s.*; a few rise to 66*s.* Tithes are commuted. Rents.

8. The paupers number 740, being 1·70 in every 100 souls. There are 646 poor children in the schools. The cost to the Department is about 1,000*l.* There was in 1861 a total of 7,589 children in the schools, taught by 93 teachers and 91 pupil teachers. The average salary of a teacher is 45*l.* in towns, and 28*l.* in the country. Paupers. Schools.

9. Another striking fact in connection with the distribution of property is that only 68 persons paid income-tax (of which the lowest grade is an income of 150*l.*), and of these 42 belonged to the town of Wetzlar. The class tax of 1*s.* 6*d.* was paid by 9,688; and of 3*s.*, by 5,995 persons. The Communalties possess 48,390 acres, and their income exceeds their expenses. They have also paid off their debts. Tax payers.

10. As regards the position of the population before Justice, the people of Wetzlar are not unfavourable for comparison with others, except perhaps in wood-stealing. This offence gave 1 case (not offender) to every 7 persons; but jury offences gave only 1 in 43,514 persons. Crimes and misdemeanours.

(β.)—*Its Division and Subdivision of Land.*

11. In Wetzlar the division and subdivision of land seem to have been operating for the last eight centuries under various influences, of which the chief is the equal division of land on inheritance. Hence Wetzlar presents a picture of the result after several centuries of this custom. These are, certainly, striking enough. But for their due appreciation a knowledge of the original sizes of property when Wetzlar was first settled is required, but is necessarily wanting. The probability is that, as a rule, no peasant settler received more than was then considered necessary to support him and his family. Any imaginary idea that the existing subdivision replaces an original arrangement of very large estates must, however, be dismissed from the mind in reading the following remarks:— Ancient custom of division.

The statistics quoted in the preceding paragraph, No. 6, may be taken as showing the extreme result of the division of the land. It may be estimated from them that there are still 2,000 owners in a position to maintain their families by their land; that is to say 200 to the square geographical mile. The interesting point would be, if it were possible, to ascertain whether the proportion of independent owners was originally the same, or greater. On the one hand, it may be doubted that the peasant proprietor of to-day is in a much worse position than his ancestor of half-a-dozen centuries ago. On the other hand, districts might be found in the Rhine Province where the division of land is as great after a less period of operation. Hence it may be inferred that equal division of land does not produce a rabbit warren, but, on the contrary, after reaching a certain point, does not produce an increasing mischief. Independent owners.

12. The subdivision of the land (as distinguished from the division into property) is very great. Each owner of tillage has, on the average, 3 acres in 17 parcels; of garden land, 2 chains in 3 parcels; and of grass land, 6 chains in 7 parcels. In order to make so low an average, there are numerous instances of yet smaller sizes. The average size of tillage and meadow "parcels" is, in some places, 1 chain, and in some parts of each parish chiefly a half to three-quarters of a chain. Hundreds of "parcels" are still less, and even measure under 1 pole. "Thus the quite small proprietor, who must seek aid by working in the mines or by day labour, frequently has his property in 40 or 50 'parcels,' scattered throughout his parish; the small proprietor, with 8 to 15 acres, has seldom less than 120 to 150 parcels; and the middle peasant has often 200 to 300 parcels." The influence of this minute splitting up of the land upon agriculture will be subsequently noticed. But its influence in lessening credit is also clear. It is evident what advantages the consolidation of these intersected lands would produce; but although the Consolidation Law of Ehrenbreitstein (which it will be remembered included Wetzlar) has offered the opportunity for eighteen months, no village has yet sent in an application to make use of it. It is a difficult work to persuade the peasants, without ocular demonstration, of the advantages of consolidation. The general opinion, however, even among the peasants, is in favour of a restriction of the right to divide and subdivide the land, by limiting to half an acre the size to which the land could be cut up. A similar limitation could be advantageously annexed to the investment of peasants with property in Ireland or elsewhere. It may give some idea of the subdivision to add that a plan of the lands around the town of Wetzlar reveals the fact that a large number of the small parcels are not half as wide as the railroad with its single set of lines. Subdivision of land. Evil effects. Opinion in favour of limit to subdivision.

(γ.)—*Its Agriculture.*

13. The three-field system obtains geographically in the mountainous districts from the Eichsfeld through Wetzlar to the Wester Wald, and across the Rhine to the Hunsrücken.

Crops.

It flourishes here in all its pristine sterility. The outward arrangement of the land is similar to the so-called square plan. Usually a third on one side of the village is set apart for winter corn (rye or wheat), and another third for summer corn (oats or barley), and the last third for fallow occupied with clover, flax, rape, roots, &c. There are sometimes four fields. The field compulsion accompanies the system as a necessary part of it. The head of the village fixes the days on which all must begin and cease to plough, and on which all must sow or reap. This system causes deficiency of fodder, and consequently a diminishing produce. It prevents a practical alternation of grain and green crops, the introduction of hoed crops, the restoring effects of several courses of clover, and the intelligent use of each part of a property for the most suitable cropping. Under this system it is of course impossible for the cultivator to distribute to the best advantage throughout the year his farm work. Neighbouring properties often differ as to the right time and right weather for certain operations, and as to the quality of the soils, but all are obliged to cultivate the same crop at the same time and with the same weather. But it is not needed to point out the disadvantages of such a system; they are patent. It will be observed that the peasants are not impervious to improvement, for they have already abandoned bare fallow. The fact of there being so few large farms has been against them, as to making progress from imitating the successful innovations of the large proprietor.

Field compulsion.

Disadvantage of absence of large farms.

Disadvantages of subdivision.

14. To the disadvantages of the agricultural system are added those of the minute subdivision of the land. This causes an enormous waste of labour, for a peasant has often to sow his winter corn in sixty to eighty different parcels. It also prevents all land improvement. It is accompanied by inaccessibility, for often hundreds and even thousands of parcels have no accommodation ways to them. The absence of such ways costs an incalculable loss of seeds and crops, facilitates theft, and renders a costly watching necessary. It prevents the abolition of the prejudicial field compulsion which must exist until consolidation is effected, and thus obliges the proprietor not to cultivate his property for himself as best he can, but in accordance with what he is ordered to do. Hence, inasmuch as diligence and judgment are not remunerated under this system, the spur to them fails to act; whereas, each proprietor, as perfect master in his own farm, would be continually spurred to their exercise.

Agricultural defects.

15. Agriculture also suffers from the wide-spread *habit of* underfeeding the cattle. Stall-feeding is general, but the sheds are usually very defective and the straw for litter invariably long. The food is usually half boiled, and this is, curious to relate, the traditional custom. Manuring is little understood, and the state of the open farmyard is generally pitiable to see. Meadows are often manured, and gypsum is used for clover. Oxen are employed for draught, horses mainly for leading minerals. The plough is primitive and the ploughing is usually scratching. The meadows are not in good order. But, in leaving this department for Siegen, the meadows are seen to be carefully arranged as water meadows on each side of the streams along which the railroad passes.

Gross produce.

16. The following figures will show the produce under this system—

Yield per Acre.	On Good Land.	On Medium Land.	On Bad Land.
	Bushels.	Bushels.	Bushels.
Wheat, rye, barley ..	22½	11¼	4½
Oats	34	22½	7
Rape	11	7	2
Potatoes	122 to 685	81	42
	Cwts.	Cwts.	Cwts.
Clover	30	15	7½

Compared with the produce of similar but better farmed districts, the produce of Wetzlar is certainly low. The natural qualities of the soil, however, vary considerably, but I was unable to ascertain the proportion of favourable to unfavourable soils. In a comparison of gross produce, with any other districts this consideration is of some account. But in a comparison of the gross produce, which is with what it might be, these qualities constitute an unchanged factor common to both sets of figures. Judging from results obtained elsewhere the gross produce might be easily doubled by the consolidation of lands and its attendant advantages.

Cattle.

The following figures will show the quantity of cattle of all kinds—

Cattle	22,772
Horses	885
Sheep	24,383
Pigs	8,089
Goats	1,853

The sheep are diminishing, but the cattle are stationary. The former are mainly

sheep for wool-bearing, and the latter are a home breed originating in Bavaria. Fattening for slaughter is not practised.

(δ.)—*Its Industry.*

17. Wetzlar has from olden times possessed a mining industry—a southern portion of the rich mining districts which extend from the manufacturing districts of the Rhine Province and Westphalia, and which have only in their lower part been recently opened out by railroads. Wetzlar will soon be in direct communication by rail with the coal districts, and then expects to smelt for itself instead of sending the iron ore to be smelted elsewhere. The gain to the iron industries of Prussia by the realization here and elsewhere of such expectations is obvious. But this important and interesting industrial subject is not within the scope of this Report.

Mining.

18. At present, the iron ore raised in Wetzlar is worth about 30,000*l*; the brown coal 1,500*l*. There are a few primitive iron works, but their production is inconsiderable. Mining employs 1,000 men and 1,600 women and children. This industrial employment cannot fail to be a boon to the numerous class of quite small proprietors, but the number of miners is a small proportion of their total number. The wages of a miner average 15*s*. per week. As yet, there is no marked line between the mining population and the agricultural population. The small proprietors look upon the mining as auxiliary to their agriculture, and the miners invariably remain agriculturists.

House spinning and weaving.

It may be noticed, in conclusion, that there is a home spinning and weaving industry throughout the department. Each household usually spins, weaves, and makes up all it requires in linen and even wool.

(ε.)—*Its Population.*

No tenant farmers.

19. In connection with the statistics in section 4, and for the object of this Report, it will be only necessary to look more closely at the peasant proprietors. There are literally no tenant farmers properly so-called; for the lands let on lease are hired by peasant proprietors. Neither is there any commercial or manufacturing class, On the other hand, there are no day labourers properly so-called; nearly all, if not all, day labourers are also land-owners.

Day labourers.

The day labourers are badly paid, and they cannot afford to provide themselves with such a diet as is mentioned in paragraph 87 of Part III, for the Rhine Province, The farm servants even do not obtain such a good board. The peasants who are not day labourers seldom take meat more than twice a week; and the well-to-do peasants rarely live much better than their poorer neighbours.

Poverty of peasant proprietors.

20. It is not surprising to learn, after considering the statistics already given that the vast majority of peasant proprietors scarcely obtain what is necessary to maintain themselves and to pay the public taxes, and that very many are struggling with need and debts. But this position is far more owing to the prejudicial results of the agricultural system than to the disadvantageous results of the economical system of equal division of land. For, in numerous parts of the Kingdom, departments, freed from primitive cultivation and agriculturally situated on a level as regards soils, &c., with the department of Wetzlar, could be selected for comparison, and it would be found that in them the agricultural relations are infinitely better. Neither are the Wetzlar peasants necessarily less industrious or economical or observant, but their deficiency in any of these respects arises from the prejudicial agricultural relations. Until the field compulsion can be abolished it cannot be otherwise.

Social relations.

21. The average age for marrying is 27. This is to some extent determined by the service in the army, for the mere fact of being married is no reason for exempting a recruit. The well-to-do peasants in some of the villages, however, marry later, and it is seldom that more than two or three children adorn their homes. Marriage is, of course, no matter of inclination, but a subject of contract. The parents, in accordance with the custom peculiar but not altogether restricted to the Frank race, usually negotiate the marriage. Weddings seldom occur between persons of different villages. A small natural obstruction is sufficient to prevent any intimate intercourse between two villages. In the south there is a district where a little rise covered with woods separates a Prussian village from a Hessian village. The walk over it is one hour. Yet the people of the one village scarcely know the people of the other. They never by any chance intermarry. They are practically as much separated as if they were situated hundreds of miles apart. So intensely local is the village life, that the inhabitants of most villages are distinguishable on a market day in Wetzlar by some slight difference in their costume, to which they adhere with true conservative tenacity. The Jews in this part of the world take advantage of a particular

annual ball, at which the maidens appear, to arrange the marriages of their daughters; and bargains, differing in no respect except in the article of traffic from the sale of a cow, are shrewdly closed to the sounds of gay music and the dancing feet of generous youth.

Money lenders.

The usurer is too well known in the department. He enters into almost all the transactions of a peasant proprietor. In fact, the usurer seems to take a place in agricultural business corresponding to the position of the jobber on the stock-exchange. If a peasant has to sell a cow, his only opportunity of sale is the Jew, who is always ready to buy. He might, otherwise, have to wait long for an opportunity of sale. The Jew seems at present to be an inevitable intermediary in all transactions, and he uses his vantage unmercifully. But another reason tends to retain the peasant in the net of the usurer or Jew. The peasant's debts, since he became legally capable of giving promissory notes and bills of exchange, consist less of mortgages than of such proofs of debt. Then, too, they are ashamed of their debts, and will not acknowledge them even for the advantage of reduced taxation. Moreover, they seem to prefer borrowing from the Jew usurer to borrowing from a respectable unusurious lender. In fact, they look upon the former as different from other men, and as one to whom they need not be ashamed of applying. It is therefore a difficult task to rescue them from the usurious money lenders who prey upon them. The Savings' Bank does what it can, both by lending on mortgage with an understanding that, as long as 1 per cent. of the capital is annually deposited in the bank, the mortgage money will not be called in; and also by lending on personal security and two sureties. The better and saving class of peasants makes more use of the Savings' Banks, and invests much in various kinds of personal property, as State loans and the like.

Minimum of land for maintenance of a family.

22. It is a point of importance to ascertain what is the minimum quantity of land necessary to maintain a peasant proprietor and his family. In this Department a minimum of about ten acres on the favourable soils of the plain suffices. This increases to twenty acres as the soil becomes more unfavourable on the rising ground. There are probably not one-tenth of the total number of peasant properties in this position. That so many as nine-tenths should not be in this advantageous position may be regarded as an evil. It is, however, considered that there is much good in a large number of small landed properties, for it places the acquirement of land within the reach of the unpropertied man, and thus places before him an attainable object of ambition, and creates a bond of attachment between him and his country and generally his village also. This opinion seems warranted by the satisfaction prevalent throughout this department under hard conditions of life.

Future improvement of position of peasantry.

Moreover, it must be borne in mind that the nine-tenths of the class of peasant proprietors will be placed in a much better position by the accomplishment of consolidation, and that many of them will then become independent proprietors; for, as the productiveness increases, the minimum of land required for the maintenance of a peasant family must diminish. They do not now obtain the full returns from the properties they hold, owing to the minute subdivision into numerous parcels. Then they will not only obtain the full returns, but be free to earn more money by labouring or working at their other occupation for more days than they now can.

How land is held.

The land is held with remarkable firmness, and little (under the circumstances very little) land comes into the market.

Peasants' clothing.

The villages seem to be mostly peopled with the descendants of ancestors of several centuries ago. The peasants, from highest to lowest, still wear the blouse. But the richer peasants wear a good cloth coat underneath on grand occasions, such as attending the departmental Council.

Houses.

Absolutely considered in reference to a standard of what is desirable for the poorest member of the human race, the greater portion of the houses are wretched, but relatively they are not so bad.

Religion.

In this department the inhabitants are chiefly Protestants.

Instruction.

The instruction of school seems to be partially lost afterwards, for few adults can compute the simplest calculation.

Morals.

It is needless to add that they keep no farm accounts. In morals they do not compare unfavourably with others. For instance, public feeling is sufficiently strong against concubinage to do more than the police regulations in preventing its occurrence. They are an honest, simple-minded race, usually contented and seldom ungracious.

Example of peasant proprietors.

23. It will be illustrative of these remarks to give two or three concrete cases from one of the poorer villages which I visited. A was the largest landowner of the village and parish. He held 28 acres in over 200 parcels, assessed at a nett return of 25*l.*, and probably yielding an income of 75*l.*, exclusive of wages. He possessed 1 horse, 8 head of cattle, some 50 sheep, and some pigs, &c. The yard was tidy, but the manure was wasted in the usual manner. The farm buildings were in good order, and the barns were spacious; but the cattle-sheds were low and unventilated, and altogether far more in accordance with primitive than modern ideas of the treatment of cattle. In the lobby of the house was a cider press. A good kitchen was on the ground floor. The general living room was up a few steps. In this the windows were small but capable of opening. There

was a bedstead in this room, probably, as is usual, for the parents. There were three other rooms. His family seemed to consist of three children. The "Hausfrau" was very cheerful, and was industriously spinning. Brightness and intelligence were not wanting throughout the family. All the house was in good repair. A is strongly attached to the identical acres he has received from his forefathers, and does not approve of exchanging them for purposes of consolidation. B had 10 acres in abont 100 parcels, assessed at about 10*l.* and probably yielding an income of 30*l.*, exclusive of wages. He only owns in reality one-half of the land, for his sister is entitled to the other half. He was making a new set of stairs for his house, and was as blithe as possible. He had been exempted from military service, as being the only son of a farmer, who could not afford to replace his services by hiring a day labourer. He had 5 head of cattle. He employed no labourer, of course; but he, his wife, and his sister, did all the farm work. His farm buildings were relatively good, and his house was in good condition. The farm yard was not as well kept as in the other case. This house had a good living room and two other rooms besides the kitchen. C had scarcely three acres. He had three goats and shared a cow. He worked as a day labourer. The house was in good repair, and contained two rooms and a kitchen; but the living room, with two bedsteads was rather small, and had a low ceiling and very small windows, which could, however, be opened. There were three children under 12 years of age, who could all read, and one recited in pure German, and with good delivery, the hymn of "Ein fester Burg ist unser Gott." The mother looked as if life were a hard struggle. The children were all very decently clothed. In the village school-room there was a boy studying to be a teacher. His handwriting was excellent; and the phrases he had composed were well put together. The teacher's house and farm, for a little land was attached to the appointment, were a model of neatness. It may be remarked, by the way, that much judgment is shown in giving to primary instruction an useful character; thus, in the school of an agricultural village the instruction in reading is given by means of exercises from a handbook to agriculture. Moreover, the teacher is generally connected with the village, if not by birth, at any rate by marriage. His place is no sinecure, for not only has he to teach sixty or seventy children, but to perform the duties of organist at the Church, and teacher of singing to the village.

Village school-house.

It is not necessary to record any other examples of the life of peasant proprietors. The village I visited had a general appearance of being inhabited by people of nearly the same position in life.

As regards the foregoing estimates of "income exclusive of wages," it is meant to include the proprietor's rent and the farmer's profit in the estimated income, and to exclude the labourer's wages, with which the proprietor should credit himself for the labour of himself and family. The farmer's profit includes consequently the returns on capital, apart from land, and the value of superintendence.

(ζ.)—*General Observations.*

No original serfdom.

24. In the first place it is to be observed, that whatever there may be of disadvantage and evil in the relations of this Department, no part thereof can be ascribed to existing or original serfdom, for the peasants were ever freemen. The obvious inference, that many of the disadvantages and evils under which Prussia suffered at the beginning of this century, were probably not attributed to the feudal system, can be quoted in confirmation of the averment in the earlier portions of this Report, that all the progress of Prussia is not to be solely ascribed to the removal of feudal hindrances by Stein and Hardenberg.

Disadvantages of the present position.

25. In the next place, it is obvious of what advantage the consolidation into compact holdings of the minutely intersected lands of the peasantry would be. The peasant proprietors suffer more from the subdivision into parcels than from the actual division of the land into properties. But, further, it is also obvious that they suffer equally, if they do not suffer to a greater degree, from the backward system of agriculture with field compulsion, of which the existence is now preserved by the necessities of the minute subdivision. Moreover, the baneful result of usurious borrowing must not be left out in accounting for these difficult circumstances.

The consolidation of the intersected lands will remedy most of these evils. They will then be able to improve their system of cultivation. The knowledge and industry of each owner will, unhindered, bring in due returns. If associations of self-help could be planted amongst the peasantry, all the evils might be gradually removed; all the evils except usurious borrowing, for the peasant himself can alone, by his own good sense and firmness, rid himself of this evil.

Land improvements.

26. There are also many land improvements which could, with benefit, be carried out. The subdivision into parcels is a great hindrance to them. But as a beginning, a small

tract of meadow-land is to be rescued from flooding, and laid out in water-meadows. It is expected that this undertaking will pay its expenses in two years, and thus increase the annual returns of the land by 1,500*l.* The cultivation of fruit-trees is also to be improved; and a praiseworthy effort is being made to obtain from Wurtemberg educated fruit masters to instruct in various ways the population in the best care of their fruit trees. It is hoped to double the produce. These efforts at improvement are due to the zealous and intelligent action of the county Counsellor. His knowledge and energy will be of great service to the Department. It is to be hoped, that before long his clear statement of the advantages of consolidation will persuade the peasants to remove the obstructions to their progress, caused by the minute subdivision into parcels.

Agriculture of Prussia in 1800.

27. Finally, it is to be remarked, that a considerable part of Prussia was, at the beginning of this century, cultivated on the three-field system, with or without field compulsion, or on some equally obstructive and backward system. The description of Wetzlar will therefore apply in the main to the Prussia of 1800. Consequently, it is evident that the mere removal of the feudal system would not have produced all the subsequent prosperity of Prussia, or even all the succeeding agricultural prosperity of Prussia. At least equal credit must be given to the removal of all such hindrances to agricultural development, as the rights of common, and the necessity for such a system of cultivation as obtains in Wetzlar.

(*b.*)—*The Department of Siegen.*

28. This department was visited for the purpose of obtaining local information respecting the Associations for Water Meadows and for Forest Cultivation. But a brief statement of the agricultural and economical relations of the department will not be out of place for the general purposes of the Report.

(*a.*)—*Statistics.*

Area.

Population.

29. The area of the Department of Siegen is $11\frac{3}{4}$ square geographical miles. The population, which has more than doubled since the beginning of the century and is increasing, is about 53,000, in which the males preponderate by 1,500. Four-fifths of the population are Protestant, and nearly one-fifth Roman Catholic. Of the total population 17,200 are under 14 years, 10,600 from 14 to 25, and 24,200 over 25 years. There are about 17,000 married or widowed persons. Here the men marry at 20 years on an average, and the women towards 20 years. In recent years there has been an average of ten emigrations chiefly to America. The births are about 1,800 a year or 1 to every 28 persons, and the illegitimate are 1 in 23. Fewer children are born in the country than in the town. Childless marriages are rare, and families of 8, 10, and 12 children are not unusual.

Emigration.

Births.

Distribution of landed property.

30. The distribution of property in land, the sizes of landed properties, and the distribution of the different kinds of land, are as follows:—

45	properties of	400 acres and more, with	37,625	acres.
24	,,	200 to 400 acres ,,	6,593	,,
1,141	,,	20 to 200 ,, ,,	55,962	,,
4,494	,,	$3\frac{1}{2}$ to 20 ,, ,,	45,476	,,
16,119	,,	$3\frac{1}{2}$ acres and less ,,	18,948	,,
21,833			164,604	

These properties are cut up into as many as 215,721 parcels with an average size of four-fifths of an acre.

Kinds of Land.	Acres.	Per cent.
Garden land	1,304	1
Plough land	21,971	13
Meadows	16,577	10
Pasturages	4,134	$2\frac{1}{3}$
Wood land	120,493	$71\frac{1}{3}$
Roads, streams	3,504	2
Sites and yards	553	$\frac{1}{3}$
	168,536	100

The number of cattle is as follows:— Cattle.

Horses	603
Horned cattle	14,750
Sheep	6,480
Pigs	1,600
Goats	2,211

The horses have diminished since the railroad was opened. The horned cattle are in about the same proportion per head of population as for the kingdom.

(β.)—*The Division and Subdivision of Land.*

31. A short distance north of Siegen is the undrawn line beyond which the Frank race, with the Frank custom of equal division of land on inheritance, ceases. There is but one close estate in the Department. All the rest of it has been and is subject to the usual Frank custom. The only exception to its application is the frequent fact that the house is left by will to one child. Each portion of land is very often divided between the children, and hence arises the minute subdivision. Inheritance of land

As to the division of land it will have been noticed that the chief difference between Wetzlar and Siegen lies in the fact that the former has only 400 owners, whereas Siegen has 1,100 owners of 20 to 200 acres. The one Privileged Estate has about 3,500 acres, of which, however, only a small portion is tillage. An owner of 25 to 35 acres of cultivated land is considered a large owner, and he of 10 to 15 acres is a middle owner. There are about 732 team-requiring farms with 16,000 acres and 7,138 non-team-requiring farms with 29,000 acres. The term team-requiring is applied to farms containing 10 acres or more of garden, tillage, meadow, and grazing land. Division of land.

32. As regards the subdivision of the land there are 215,721 parcels for the 168,800 acres, giving an average size of $\frac{3}{4}$ of an acre. A consolidation would, therefore, be of great use, but there is no law, and even no great desire amongst the peasants, for such a practical consolidation. The subdivision into parcels is not nearly as minute as in Wetzlar. But a not unusual size of a parcel is 6 to 7 chains; and a parcel of two acres is a rarity. Subdivision of land.

(γ.)—*Its Agriculture.*

33. Geographically the department is a mountainous district, and geologically it is a graywacke district. As will have been seen from the statistics the forest land occupies 71 per cent. of the area. The villages are usually in the valleys with their comparatively small tracts of meadow and plough land, and behind them towers the mountain side with their comparatively large tracts of forest land.

As regards the plough land, little need be said. The cultivation resembles in much that of Wetzlar without the field compulsion. Here each owner cultivates what he pleases in each of his numerous parcels. It is to be doubted that, so long as the minute subdivision lasts, the peasant proprietor of Siegen is, as regards his plough land, in a more advantageous position than him of Wetzlar, the parcels of land being in each case equal. Put rye for wheat and potatoes for peas, and then the usual succession of crops resembles in principle the succession of wheat, barley, oats, and peas anciently recorded for Scotland by Lord Berhaven. In better districts the rotation is as follows:—In the first year, half potatoes and half rye after manuring; in the second year, half rye after potatoes, and half oats; and in the third year three-quarter oats and quarter clover. The ploughing is about six inches deep. There is little drilling of seeds. Manuring is much better understood than in Wetzlar, and chiefly in this particular that sewage water is carefully collected for the meadows. Manure is ploughed in, not merely spread. Wood ashes are used for clover in the meadows. Compost earths are not unknown. In consequence of many unfavourable circumstances, such as mountainous situation, long frosts, and late frosts, a comparatively (for Prussia) large quantity of seed sown broad-cast, is used; viz., of rye, per acre, $2\frac{1}{4}$ bushels, of oats $5\frac{1}{2}$ bushels, of potatoes $22\frac{1}{2}$ bushels, and of clover 22 lbs. In the "Hauberg"-land rye is the chief crop, and the grain is considered sound and good. Barley is rarely grown anywhere, and wheat is still more rare; pulse crops are almost unknown. Plough land. Rotation.

34. The meadows are cultivated with special care. The miner washing his ore on the mountain side could not fail to early perceive the good results of water from the mountain sides, (and especially of water that had passed in its descent through a farm-yard,) spreading over grass land. From these practical observations sprang up the scientific cultivation of meadows. They are water-meadows—either ridge and furrow, or catch, or terrace-meadows—on the principle of irrigation by running water. There are in this Department no meadows irrigated by damming up water. It is not necessary to add to the notices Meadows.

already made in this Report respecting the water-meadows. This cultivation has obtained so much renown, that specially educated meadow masters are in request from Siegen for other parts of the Kingdom. Very few meadows are beyond the reach of this system, and these being dependent upon rain and dew alone are called sky-meadows. These give one crop annually; but water-meadows always give two crops, and a few are mown three or four times. The mistake is often made of delaying the first crop until the grass is in seed. The returns are 60 cwt. per acre on good meadows, 36 cwt. on medium meadows, and 12 to 15 cwt. on bad meadows, hay and after-grass included. But the meadows do not supply enough for the consumption of the cattle in the department. The expensive ridge and furrow meadows are not likely to be much extended, as labour is much dearer than it was. But the catch meadows can be less expensively arranged in any district.

Hauberg forest cultivation.

35. The "Hauberg" system of forest cultivation is a peculiarity of some importance. The land, subject to the forest cultivation in common as described in paragraphs 43 and 44 of Part III, is called the "Hauberg," which, therefore, constitutes a distinctive name for the system. It will be recollected that the "Hauberg" cultivation, consists in allowing the oaks to grow for eighteen years, in pealing the bark, and cutting down the wood, and in using the land for one year as tillage. The owners in common select a President or head of the Association, to represent them, and subject to the opinion of the chief Forest Master in cultivation they manage their own affairs. The shares consist of a certain number of a fixed total of parts allotted to each proprietor. These he can dispose of at will. Every year they decide amongst themselves as to the proper staking out of the tract for cultivation; and disputes on this subject do not come before the authorities. It is a matter of no little difficulty to apportion fairly the due shares of the land, for the variety of qualities of land is naturally great. The manner of doing this was ingenious, but complicated. Now it is becoming the custom not to stake out the tract, but to cultivate it as a whole, and pay to each proprietor his corresponding share of the proceeds. The labour of cultivation is heavy, for the land must be prepared chiefly with a special kind of hoe for sowing. But there is no need at present to describe in its details the cultivation, which is, however, interesting from the practical way in which many difficulties are overcome. Rye and buck-wheat are the crops of "Hauberg" land. The produce is returned at 450 lbs. grain, and 1,350 lbs. of straw (of specially good quality), per acre. But, if the labour be calculated at proper rates, the profit is very small. Yet, it must be remembered, that the owners receive these wages, and if they did not labour at this occupation, might possibly be idle. After the harvest the individual ownership ceases, and the whole tract becomes again the property of all. Whether or not the cultivation could be profitably replaced by growing timber, is a moot question. But it would be difficult to persuade each owner to wait thirty years for his first returns, instead of receiving his present annual returns. The procedure is similar on the Eifel; but the growth of wood is generally shorter, being only twelve years (*vide* paragraph 44 of Part III).

(δ.)—*Its Industry.*

36. Siegen is a rising industrial department. Iron, lead, copper, zinc and cobalt are all worked. Iron is, however, the chief source of prosperity. About 4,000 persons are employed in the mines, representing 10,000 souls out of the 53,000 of total population. It is probably from the profits of its long established mining industry that the department has drawn its capital for the renowned water meadows. Its industry has certainly effected more for the population than the similar industry of Wetzlar for its population. The ores raised are worth about 150,000*l.* The total value of the mining and smelting industries is about 750,000*l.* There is an interesting institution of smelting furnaces owned in common by a large number of owners, but used separately by each association of owners; but its description belongs rather to a report on the industrial position of Prussia. Such smelting furnaces are, however, as yet very primitive, corresponding to the ancient origin of the institution; and they produce these metals very wastefully. There are one or two modern blast furnaces. The total production of all the eighteen iron smelting furnaces is worth about 210,000*l.*

Value of ores.

Value of iron produce.

In these and puddling and other furnaces 860 workmen are employed, and in foundries, wire, and machine works, another 345 men. There is also a spinning and weaving industry of some importance.

(ε.)—*Its Population.*

37. Except in the town of Siegen itself there is no sharp line drawn between the urban and rural population. Even in it, there are a large number of persons who are, at any rate, auxiliarily occupied in agriculture. Fortunately for the department there is no

class of manufacturing labourers distinct from the agricultural population. It is difficult, in such a case, to distinguish between those chiefly occupied in agriculture and in industry. The following are the figures given for 1861 :— Agricultural population.

Persons solely or mainly occupied in Agriculture:					
Owners, Tenants	2,198 with 10,117 relatives and dependents.				
Persons auxiliarily occupied in Agriculture:					
Owners, Tenants	3,364	„	14,135	„	„
Making a total of	5,562	„	24,252	„	„
Agents and labourers..	2,834	„	8,000	„	„
Total.	8,396	„	32,252	„	„

Making in all 40,648 out of a then population of 51,674.

The remaining 11,000 belonged to the officials, commercial class, handworkers, small industrial class, and servants.

As regards the land question, it is interesting to observe that more than two-fifths of the whole population are actually landowners: or, allowing for 20,000 children, two-thirds of the remainder are actually landowners. Only a thirtieth portion of these are, however, in independent circumstances from agriculture alone, that is, possess team-requiring farms. Landowners.

The population can in general be considered to be well to do. There is, on the one hand, a relatively considerable number of monied people, and on the other hand, there is no pauperism among the working classes. For this the mining industry is, in some degree, to be thanked; but the diligence and economy of the Siegen population are in a much greater degree to be thanked. Of the working classes, the workers in iron are in the best position. They earn good (for the district) wages of 1*s.* 6*d.* to 2*s.* 6*d.* a-day, have good food, and mostly work a little at agriculture, which is beneficial to them. The small cultivating proprietor, who is too often heavily in debt, is the worst off, and there are few persons who can exist by the produce of agriculture alone. If, as in some parts, he can get no auxiliary employment, his condition is wretched. The day labourer, except in the towns, is invariably the owner of a small property. Pecuniary position of peasantry.

38. There is no doubt that the population has profited much by the associations for meadows and the Hauberg system. As regards the latter, each owner would by himself have obtained less return, and the present growth of low wood would have been lost. The advantages of association in meadows are obvious. The principle of compulsion is no doubt an encroachment upon the liberty of the subject to obstruct the progress of whatever he may please to dislike, but it is here recognized as no evil addition to the laws on these associations. The people are firmly attached to the Hauberg system, and enthusiastic about their meadow associations. It is not without advantage to have the Government Forest Inspector in a position of active superintendence. If a sensible head of an association finds himself likely to be overruled in the full meeting of the society and to be directed by his co-partners to execute a prejudicial detail of cultivation, he can have recourse to the scientific opinion of the Forest Inspector, and strengthen his position. In this way it is often advantageous to have the properly qualified man at hand with authority to command if necessary. These associations have certainly, on the whole, considerably added to the income of the peasant proprietors. Without them and the industry, the department could not have held its own and advanced so well. It is the climate, soil, and position which render the circumstances of the pure agriculturist so bad, not the size of his property. The large proprietor would, with his land, not come off better. On the contrary, the fact seems to be that the small proprietor obtains more per acre than the large proprietor. Land, if exchanges of parcels be included, is said to change hands every twenty years. Associations are beneficial.

A striking instance of the instinctive conservatism of the small peasant proprietors, even of a struggling peasantry, was lately offered in this department. A so-called "social democrat" association of a large manufacturing district sent two lecturers into Siegen. The agricultural population were in difficult circumstances. The industry was considerable, and therefore the restless portion of the manufacturing population would be there So they thought they might gain some adherents. The lectures were duly advertised, and the authorities were wisely silent and inactive. The first lecture was ridiculed by the audience and at the second the lecturers were fairly laughed out of the room. The lecturers returned discomfited.

(ζ.)—*General Observations.*

39. This department offers an instructive example of the possibility of removing several of the evils of small proprietorship by the principle of association, applied in such a manner as to retain the advantages of individual property and to obviate the disadvantages

of individual credit. Any return from their forest-land would otherwise have been impossible for the small peasant proprietors. A water meadow would have been an impossible improvement for them.

Industry has had a greater influence in Siegen than in Wetzlar, but has not yet separated the population into distinct manufacturing and agricultural classes. It is of important assistance to the small proprietor, but it does not detach him from his land. It will, however, have been noticed that the indications of a manufacturing class are to be traced in the want of forecast shown in early marriages. The half-mining, half-farming peasant population of Siegen is more blessed in children than the well-to-do peasant proprietor of Wetzlar. On the other hand the absence of the field compulsion and the presence of greater freedom of cultivation may be owing to the greater freedom of ideas arising out of the greater importance of industrial pursuits in this department. But the instinctive conservatism, as manifested by attachment to his little property and his sense of the principle of property, of the small proprietor is not injured by its influence.

(*c.*)—*The Provincial District of Cologne.*

40. The chief point of interest in respect of this provincial district lies in the comparison of tenants and proprietors, and consequently all other questions, except the general condition of the peasantry, will be more briefly treated.

As there was only time to visit the department of Bonn and the country department of Cologne, the remarks in this subdivision will be chiefly based upon inquiries within that area, but are in the main applicable to the whole Provincial District. For this reason the statistics of these two departments will be specially given.

(*a.*)—*Statistics.*

Area. Population. agriculture.

41. The area is 70 square geographical miles. The population has increased from 324,632 persons in 1816 to 557,496 in 1861. There were engaged in agriculture :—

Solely or mainly—	
Owners	26,402
Tenants	1,898
With relatives and dependants	111,444
	139,744
Auxiliarily—	
Owners	9,820
Tenants	1,680
With relatives and dependants	43,693
	55,193
Total	194,937

The bailifs, servants and day labourers numbered 41,675 persons with probably 100,000 relatives and dependents. Hence nearly 300,000 persons were interested in agriculture. The balance of emigration was in 1863 only 70 persons being one-fourth of the average for the Kingdom and also for the Province. The births about 21,000; the illegitimate being 5·86 per cent., half as many more as the average of the Province.

inds of land.

42. The quantities of each kind of land are as follows :—

	Acres.
Tillage, including moor and turf land	528,548
Vegetable gardens and orchards	21,838
Vineyards	2,480
Meadows	58,476
Pasturages	19,034
Wood land	330,047
Waste land and heaths	32,220
Cemeteries, &c.	2,862
Roads, rivers, waters, barren land	33,432
Sites, &c.	7,760
Total	1,036,697

istribution of nded property.

The distributions of properties in land was in 1859 as follows :—

	Number.
Of over 400 acres	142
Of 200 to 400 acres	256
Of 20 to 200 „	9,660
Of $3\frac{1}{2}$ to 20 „	33,404
Of under $3\frac{1}{2}$ „	80,876
Total	124,338

There are 142 privileged estates.

43. Industry has an important position. The mining industry employed in 1863 :— Industry.

For brown coal	898	labourers, with	1,906	wives and children.	
For iron	496	„	1,027	„	„
For zinc and blende	1,811	„	2,559	„	„
For lead	199	„	2,801	„	„
For copper..	216	„	348	„	„
For copper and alum.. ..	100	„	200	„	„
Total	3,720	„	8,841	„	„
The metallurgic industry employed—					
In iron and steel works, about..	1,500	labourers, with	3,700	wives and children.	
In other works	300	„	600	„	„
Total	1,800	„	4,300	„	„

The textile industry employed :—

The textile industry employed—		
For wool spinning	982	labourers.
For cotton „	1,004	„
For silk weaving	823	„
For cotton and half-cotton weaving	1,598	„
For wool and half-wool weaving	351	„
For stocking weaving	469	„
For cloth „	403	„
Total	5,630	„

There were also numerous classes of workmen employed in other industries. Then commerce is extensive, and the smaller trades are in large proportion to the population.

44. The public relief of the poor cost an average of 49,500*l.* in 1859 to 1861. This included paying for poor school children. This expenditure was met by 33,000*l.* from special funds and 16,500*l.* in money contributions. Poor.

In respect of crimes and misdemeanures the average is below the average of the State, being one case to 3,118 persons. Crime.

There are few sheep, but the horned cattle are double the average of the State, and the horses are above that average. "arcels."

There are 1,813,410 "parcels" to the 1,036,697 acres, making an average size of three-fifths of an acre. Of the total area there are 124,175 acres of more or less inalienable land and 912,522 acres of alienable land.

45. The country department of Cologne, excluding the town of Cologne, and the department of Bonn, contains 7¾ and 5½ square geographical miles, and possessed 63,600 and 60,300 inhabitants respectively. Of the former, 6,500 were in the town of Dentz, and of the latter, over 19,000 were in the town of Bonn. These numbers have increased much since 1862. Statistics of Department of Cologne and Bonn.

In 1861 the persons engaged in agriculture were as follows :—

	Cologne.		Bonn.	
Mainly occupied—				
Owners	2,433		2,635	
Tenants	470		151	
Families and dependents	12,599		12,750	
		15,502		15,536
Auxiliarily occupied—				
Owners	821		1,370	
Tenants	349		363	
Families and dependents	3,557		5,342	
		4,727		7,075
Bailifs, labourers, &c.	..	6,514	..	5,312
Total	..	26,743		27,923

The kinds of land are as follows :—

	Cologne.	Bonn.
Tillage	91,442	43,583
Garden	3,376	3,720
Meadows	783	1,808
Pasturages	427	400
Wood land	11,400	23,480
Roads, &c.	3,568	2,058
	110,996	75,049

The distribution of property is as follows:—

	Cologne.	Bonn.
Over 400 acres	21	7
From 200 to 400	78	12
From 20 to 200	745	465
From $3\frac{1}{2}$ to 20	2,683	3,354
Under $3\frac{1}{2}$	8,003	15,096
	11,530	18,934

In the former there are 21, and in the latter 16 privileged estates.

e of land.

46. The average price of land is for tillage 52*l.* 10*s.* an acre in the department of Bonn, and 53*l.* an acre in the department of Cologne, and for garden land, 76*l.* 10*s.* and 124*l.* respectively, and for meadow land in the former, 46*l.* an acre. The average rent is 1*l.* 1*s.* and 1*l.* 8*s.* respectively for tillage, 2*l.* 10*s.* and 4*l.* 1*s.* respectively for garden land, and 1*l.* 13*s.* in the former for meadow land. Of the mining industry in the two departments I have no figures at hand. In the department of Bonn about 800 workmen are employed in

istry.

alum, cement, stoneware, and other factories. In the country department of Cologne 2,000 workmen are employed in machine and railway-carriage works, and about 800 in other factories, including 122 in a beetroot sugar mill. The direct taxes produce per head 7*s.* and 7*s.* 6*d.* in the country department of Cologne and in the department of Bonn respectively. In the former 13,066 owners possess the 116,279 acres, and in the latter 20,481 the 79,270 acres. The following are the quantities of alienable and inalienable land in each:—

ribution of
erty.

	Country Department of Cologne.	Department of Bonn.
	Acres.	Acres.
State property	8,472	7,051
Communal property	453	1,250
Church and glebe lands	2,666	1,417
Charitable institutions	4,310	1,654
Fiefs and *fidei commissa*	758	None
University, schools, &c.	14	276
Total more or less inalienable ..	16,673	11,648
Freely alienable	99,606	67,622
	116,279	79,270

(β.)—*Its Agriculture.*

47. It is not necessary to enter into an examination of the division and subdivision of the land. The former varies much, and varies exceedingly even in the two departments specially visited, for in that of Cologne the properties under 20 acres are about 12 times,

ision of land.

and in that of Bonn 36 times as numerous as those above 20 acres. This latter distribution approaches that of Wetzlar. As in this provincial district there are on the average 13 parcels to each owner, the subdivision will also in some parts approach that of Wetzlar. It will be recollected that the opposition to consolidation of intersected lands was too great to admit of its being connected with the extinction of commons. This latter has proceeded favourably, and has conferred many benefits upon the whole province.

division of
l.

48. Agriculture is in most respects favoured by the climate, which is more of a sea than a continental climate. In the plain along the Rhine the soil is good, although it varies much and suddenly. The country department of Cologne contains 45 per cent.,

iculture.

and the department of Bonn contains 25 per cent. of favourable soils, chiefly loam. They have also 45 and 50 per cent. respectively of mixed soil, and the latter has also 20 per cent. of gravelly loam and gravel. Usually the land of the plain is self-drained, and requires no artificial draining. Plough-land is thus distributed according to the classification of the land tax.

	Acres.
1st Class	6,768
2nd „	42,158
3rd „	102,529
4th „	137,896
5th „	119,300
6th „	86,573
7th „	51,115
8th „	15,914
	562,253

On the lower land all kinds of crops are cultivated. On higher lands, not exceeding 600 feet above the level of the sea, most crops, excepting the finer vegetables, succeed everywhere. Above this height oats are the most advantageous crop. Chalk and bone-meal, as well as animal manure, are used. Above 900 feet comes the so-called moor land* ("Schiffelland"), which is cultivated by burning the sods into ashes for manure. The land is tilled for three years, and then lies fallow from fifteen to thirty years. Horses are used on the larger and oxen on the smaller farms. The peculiar "Huns" plough, already described, is in common use, but modern ploughs are also much employed. Implements of modern construction are generally replacing the ancient forms. Steam threshing-machines, and drill machines and extirpators are increasing in number, and steam ploughing is talked of. Corn is not usually spread for drying, but immediately bound into sheaves.

Meadow land is being regulated, especially on the right bank of the Rhine where the provincial district approaches the department of Siegen. Pure fallow only occurs in the hilly regions, and scarcely ever in the Departments of Cologne and Bonn.

The rotation is generally in six or seven courses without fallow, or in five with half fallow. The seven course is—1, potatoes; 2, wheat, winter barley, or rape; 3, rye; 4, clover; 5, oats; 6, wheat; 7, rye, and then spring turnips ("Stoppelrüben"). But there are numerous varieties according to soil and position. The gross produce averages in the plain on land of the first-class 27 bushels, and of the fifth-class 14 bushels for wheat and rye; 45 and 18 bushels respectively for barley, 23 and 9 bushels respectively for rape, 56 and 23 respectively for oats. Rye in the eighth-class produces 7 and oats 11 bushels per acre. Clover produces in the first-class 3,750 lbs., in the fifth-class 1,800 lbs., and in the eighth-class 600 lbs.; and potatoes produce 12,000, 4,500, and 1,800 respectively. The gross produce in the hilly regions is of course much less in the same classes, usually one-third less. **Rotation.**

The number of cattle in the provincial district is as follows:— **Cattle.**

	No.
Horses	20,311
Cattle	151,497
Sheep	57,722
Goats	25,634
Pigs	37,632

Of the cattle there are 92,232 cows, and of the sheep 43,326 are half-bred, and only 2,175 are merino and fully bred.

There is much room for improvement in the races of cattle, but much attention is already given to breeding of horned cattle. At present the town of Cologne is partly supplied with beef by animals which come from long distances, even from Hungary. It is beginning to be understood that by organizing the farming for fattening cattle, the neighbouring farmers could supply the meat, improve their farming, and increase their profits. There is some high farming in this provincial district. It will not be uninteresting to give a brief account of the farming on a large estate belonging to a beet-root sugar company. This was visited last June by agriculturists under the leadership of the late Professor Hartstein, and is near Cologne. The estate consists of five farms, each with its stock, and contains in all about 1,400 acres. The farm buildings are partly good and partly indifferent. The farms are, however, mostly on lease, and the lessor should make, but has not made, the necessary repairs and reconstructions. Both horses and oxen are used for farm work, and the latter are afterwards fattened for slaughter. In order to carry on the farm work at the proper time, and also to use the beet-root shreds after the expression of the sugar, an ox of 1,200 lbs. to 1,300 lbs. living weight is maintained for each 5 acres to 6 acres. These are at present of the Birkenfeld or Schwarzwald race. Reckoned upon an ox of 1,200 lbs. living weight, the daily fodder of an ox consists of 80 lbs. of expressed beet-root shreds, 10 lbs. of straw (chiefly oat straw), 6 lbs. of chaff, 3 lbs. of poppy cake, 2 lbs. of malt dust ("Malz-keime"), 1 lb. linseed. This diet varies a little according to the season. For hard work the oxen are only used half the day. For fattening the daily fodder is different. It consists of 60 lbs. expressed beet-root shreds, 6 lbs. chaff, 5 lbs. clover hay, 4 lbs. poppy cake, 1 lb. rye bran, 1 lb. maize, 1 lb. lupines, 1 lb. peas, 2 lbs. malt dust, 2 lbs. linseed. The rye, bran, maize, lupines, peas, and linseed are given as warm liquid food. The cattle eat also the straw which is provided in large quantities. An increase of 250 lbs. to 300 lbs. in weight is expected. Cows are only kept for the immediate wants of the establishment, as they do not use so profitably the expressed beet-root shreds. The manuring is very high and is used for the grain crops which precede the beet-root. The superphosphate is made by a simple process on the **High farming.**

* "Schiffelland" is said to be so called from the provincial name of the peculiar implement used in its cultivation.

estate, and, although the bones are partly imported from Belgium, costs only 7*s.* to 7*s.* 6*d.* per cent. The proximity of Cologne itself is a great help in procuring natural manure. There is no regular course of cropping. The factory expects 100,000 cwt. of beet-root annually from the estate, and the farming is based upon this demand. If the manager can persuade the neighbouring farmers to enter into contract to supply beet-roots, then he cultivates fewer on the estate. The suitable soil for beet-roots is cropped with them and grain crops alternately. Last year (1869) the crops were thus distributed:—

	Acres.		Acres.		Acres.
Beetroots	562	Winter wheat ..	253	Oats	162
„ for seed ..	19	Summer „ ..	83	Peas	3
Potatoes	6	Rye	83	Lupines	12
Fodder roots	16	Barley	20	Vetches	5
Red clover	108	Clover grass ..	8	Lucern	60

And 30 acres of flax and other crops. The proportion of roots to grain is over one-third.

The preparation for taking grain crops is heavy manuring, nine to ten inch ploughing harrowing, rolling, and then the action of the extirpator; the seeds are drilled with Garrett's machines, corn at 7½ inches for early seed and 6 inches for later, and 5½ for oats and summer wheat. Smith's horse hoe, as improved by the manager, is used in the spring, and, if necessary, Crosskill's roller also. Steam and whim threshing-machines are used. For the beet-roots the preparation is 13 to 16 inch ploughing and then harrowing, crushing, and extirpating, until the tilth is very fine, like garden cultivation. Dibbling machines are tried for sowing. The grains are only sown after eight days of at least 52 degrees Fahrenheit. The average gross produce is of beet-roots 150 cwt., of wheat, 1,200 lbs., rye, 1,000 lbs., barley, 1,200 lbs., oats, 1,100 lbs., beet seed, 1,000 lbs., clover, 30 cwt.

It will have been noticed that the estate consists, to a large extent, of leased lands. Some portions were originally leased to small tenants. The Manager can frequently, for ten years, and even more, tell by the appearance of the crops in a field which part of the field was formerly one of such small leased portions. This arises from the fact that such small tenants seldom farmed well and alike. One would do tolerably well by his acre or more even to the end of the lease, and his land would take two or three years to get into good tilth. Another would use his land carelessly, and his land would require half-a-dozen or more years to bring into good condition. But another—not an unfrequent case—would extract every possible penny out of the land, and ruin it for ten years.

Agriculture of Department.

49. The agriculture in the department rarely approaches the preceding description; and in the neighbourhood of Bonn, except in garden cultivation, it less rarely rises to even comparatively high farming. But in neither department did there seem to be any material difference between the farming of the tenant farmer and of the proprietary farmer. The middle tenant is, however, more easily induced to cultivate beets than the middle proprietor even if the greater profit is proved to each. The middle proprietor is satisfied with the returns from his land and cares little to have more than enough. But this is only exceptional, and arises in part out of a fear on the part of the proprietor to spoil his land, which does not act so powerfully in the case of the tenant. Although agriculture suffers from the effects of minute subdivision even on a large estate composed more or less compactly of a number of properties, yet in spite of the minute subdivision of land it prospers, and the independent peasant proprietors are able not only to maintain themselves respectably, but often to save.

Industry.

50. There can be little doubt that industry aids agriculture in the Provincial District, but it is difficult to apportion the amount of aid, even where there is a surplus population, for industry not only provides employment for surplus population, but itself promotes an increase and closer density of population. But no examination into industry is necessary in the notes respecting this provincial district.

(.)—*Its Population.*

No class of tenants.

51. Even in this provincial district, where agricultural tenants are (for Prussia) numerous, there is no class of agricultural tenants. Even here the tenants are mainly on more or less inalienable lands. Such lands are in larger proportion than they would have been, had the French been able to sell the church lands they secularized. Reverence for such lands was in those days too great for many to be willing to purchase them. Hence the French sold what they could in small portions, and endowed charitable institutions with much of the remainder. In this way we have a cause for some of the lands in mortmain, and a cause for some of the small division of property in land. The past distribution,

therefore, does not replace to that extent original large estates. Neither does it probably, as regards the rest of the land, within the district.

Day labourers.

52. Here, as elsewhere, the small proprietors constitute the main portion of the day labourers. The small tradesmen and hand-workers turn out to gather in the beets, and the cobbler works at such a time at his trade on Sundays and in the field during the week. There are, however, not sufficient farm labourers for the larger estates, and an importation of Swedish peasants is likely to increase and to extend in the province. There is, therefore, seemingly, no surplus population, probably because industry has so rapidly developed. It is usually considered so beneficial that a labourer should have some land, that the mining companies usually give the miners land; and a proposal to manufacturers to provide plots of land for the working people is not always ridiculed. The cost of living to a labourer's family (parents and three children) is in Cologne itself estimated at 61*l.* 10*s.* a-year; but in the country, according to the locality, from 22*l.* 10*s.* to 30*l.* The wage is, in Cologne, 2*s.* to 2*s.* 6*d.* a-day, so that the labourer, artizan, or other, scarcely earns what he must spend. This holds good in a varying proportion in the country, for the father never appears to be able to earn in day wages enough to meet the expenses of his family. The fact of his usually possessing his own house and a field, and perhaps a cow, is not forgotten in the estimate. Some members of the family must work also. If the day labourer be also a proprietor of more than a plot of ground, then he gets a larger income. The wages of the farm servants vary also very much. Numerous Savings' Banks and Loan Associations have been established to protect the peasant from the usurer. They are still prospering most rejoicingly. The Savings' Banks do not, however, lend on personal security, as in some other places. The pawning establishments are in connection with the Savings' Banks in Cologne and Bonn. There are several benefit societies, especially where manufacturing or mining industry is. There is said to be comparatively little pauperism, considering the extent of the manufacturing influence. But I could not ascertain with any definiteness the proportion of pauperism in the agricultural and industrial classes respectively.

Peasant proprietors.

53. The manner of living of the peasant proprietors, is grade for grade, better than in the prospering villages of the Provinces of Saxony. But the difference between the two regions of peasant proprietors is more marked in this, that here there is much more movement, and much more individual life than elsewhere in the Kingdom. The proprietary peasantry is less servile to authority, and more independent of suggestion from above. Race can have little to do with the difference, even if race could make a difference. Past political history has more, and the provocative influence of restless industry may have much, to do with it. Mere prosperity suffices not to account for it, as will be more clearly understood at the conclusion of this Report. Nor is the influence of Western civilization to be forgotten. The Rhine Province has the independent character, and the persevering activity of Gallic civilization. The Gallic combination of pleasure and economy is also to be seen. There is thrifty economy, but not the rigid economy which excludes any expenditure for pleasure. The peasant proprietors save, but they also take trips on the Rhine. The Saxon peasant proprietors have a little of this spirit, and combine dancing and music with the economical plainness of the village life. The Wetzlar peasantry have been too isolated and are struggling too hard with life to blend pleasure happily with economy. But they, too, are given to village amusements.

One point in the character of the Rhenish peasantry must be specially noticed. It arises probably in part from the independence of character, the greater individuality of life, and the perfect reliance on his own opinion. Then, too, he has an unusual knowledge of the laws of his country, and being opinionated in such knowledge, is induced to enter into, and to obstinately carry out, law-suits. But whatever the cause may be, the fact is, that he is litigious, especially in the department of Bonn. Unfortunately for him, the law costs are heavier here than in the Eastern Provinces; but he will rather ruin himself by carrying his suit from one Court to another, than abandon his opinion.

The peasant cannot be said to be wealthy, or usually even well to do; yet the very poor peasant is rare. Wealth is widely, and therefore more equally, distributed. The Rhenish peasant is sociable, and his speech is full of proverbs. He is good-natured, and prudent, and even distrustful in business transactions of others. He is generally industrious. As proprietor he carefully tills and improves his land, but is not unfrequently wasteful of his time. Anything out of the usual course, such as a visit to a notary, consumes a whole day. Announcements of births, recruiting, and military affairs, and the like, have their days marked, as the saying is, "in blue" to be fêted by cessation of labour. This waste of time is in addition to the necessary waste out of which it probably proceeds, and which their religion demands for festival days and pilgrimages of eight and even ten days. These, too, act prejudicially in the best agricultural season. In winter also, much time is spent in the "dolce far niente." The peasants do not, however,

adhere, like limpets to a rock, to the olden customs and maxims of cultivation and life of their forefathers. In this respect the last half century has witnessed an enormous improvement. This improvement is in no small degree due to compulsion in the two forms of school attendance, and military service. The formerly more common peasant character of immobility, warranted the proverb—

"Wenn der Bauer nicht *musz*,
Regt er weder Hand noch Fuss."

Marriages.

54. Marriages amongst the peasant proprietors, who are not day-labourers, display generally the usual prudence and forecast, and take place, on an average, late. But the contrary is, unhappily for them, the case amongst the day-labourers, who exist mainly by labour. They marry lightly, and consequently with their families become, not unfrequently, charges for the winter upon the poor funds. This cause, taken in connection with the estimate before given of their income and outgoings, will fully account for their neediness.

Houses.

Clothing

Education.

Morality.

55. As regards the peasantry in general, their houses are, absolutely considered, too often wretched, but relatively they frequently compare well with the houses of other classes. Their clothing is always respectable, and generally neat; rags are indeed a rarity. Even if they retain their school-teaching, and profit by it to gain some other knowledge, they seldom, if ever, display any desire for further education, either for themselves, or for their children.

In conclusion it may be noticed that their morality is on the whole praiseworthy, even if the "Code Napoléon" may, as is thought, be credited with a material share in that result.

(δ.)—*General Observations.*

56. The chief object of visiting this provincial district has been only negatively attained, for the agricultural tenants do not exist even here as a class, and no useful comparison of agricultural tenants and proprietors could be instituted. It is clear that such a comparison for Prussia can only be made in New Pomerania, but that province was too far out of the line of my journey to be included. The other object of sketching briefly the general condition of the peasantry has been, it is feared imperfectly, because hastily, attained. It is true that they prosper, and lead a more active and intelligent life than the peasants of the eastern provinces. But many are necessitous, and most of them could lead a much more active and intelligent life. There is no proof that the equal division of land, even accompanied by the prejudicial subdivision of each portion, is ruining the province or beggaring the peasant proprietors.

Tenants *v.* Proprietors.

57. It was acknowledged that, though in theory and with very long leases the tenant should farm better than the proprietor, both starting with the same original capital, yet, as a rule, the fact was that the existing proprietors farmed better than the existing tenants. As rents, if the values and rents of land in paragraph 46 be compared, average only 2 per cent. and even less on the value of the land, it is clear that the tenant of equal capital would, from this point of view, have an enormous advantage over the proprietor. But so many other considerations intervene, that, although the Prussian nation is by no means wanting in keen money-making men, the result is that these money-making tenants do not constitute a class in the agricultural economy. For the most part, the lands on lease are leased by proprietors, or let in small portions to small tenants who cannot possibly farm high, or who buy land as soon as they can. Moreover, the nett pecuniary advantage in favour of the tenant compared with the proprietor is the difference between the original capital of the tenant and the part of his original capital which the proprietor can raise on mortgage, for the interest on the mortgage would cancel the rent of the tenant. The probability is that the difference is on the average a quarter of the original capital. Is the extra advantage of that quarter employed as farming capital sufficient to counterbalance the advantages of ownership even with the disadvantages of a mortgage? If the mortgage be granted by a savings bank, or a loan association, or any other institution not likely to call in the money at an inconvenient moment, and possibly granted with a scheme of redemption, the proprietor's position is yet more improved.

As to leases.

I met with a curious incident of the working of agricultural leases in regard to permanent improvements. The lessor did not or would not build or rebuild the necessary sheds for cattle and other purposes. The lease ran for ten years unexpired. The lessee could not afford to build or rebuild sheds for the advantage only of using them during the lease. He was therefore seriously thinking of importing iron sheds, which would not be fixtures and could be taken down in a couple of days. If he could have bought land he could have made the necessary permanent improvements for his farming business, but he was obliged to hire the neighbouring land. If the landlord makes the necessary improvements, then the agricultural tenant can farm better, but if he do not make them, is it good that the tenant should be hampered? If not, would the State be right in compelling

improvements on the part of the landlord on the alternative of a building lease at an agricultural rent?

There is no scarcity of money in the Rhine Province, and, at any rate in the neighbourhood of Cologne, the small peasant proprietor can easily get money at 4½ and even 4 and less per cent. I did not succeed in finding out to what extent he availed himself of his facilities for the purpose of procuring circulating capital. No scarcity of money.

(*d.*)—*The Department of Langensalza.*

58. This department was selected for the purpose of looking at the effects of consolidation of intersected lands, and of observing, so far as the season permitted, the more advanced agriculture of the peasant proprietor.

(*a*)—*Statistics.*

59. No complete set of statistics of later date than 1863 exists; but the statistical relations have not materially changed. As the village of Altengottern was the chief spot of inquiry, its statistics will be given. The area of the department is nearly 7½ square geographical miles, and the population is about 34,000, of whom 12,500 live in the three towns, and 21,500 in the country. But there is no essential distinction between urban and rural population. Hence the proportion of children is the same in each kind of population. The births averaged 1,300 a year, and the illegitimate were 1 in 10. The deaths averaged less. The per-centage of deaths of infants was 21 per cent., and was considered moderate; but it was only 16 per cent. in 1859. The towns had in three years increased by 2·34 per cent; but the country by only 0·85 per cent. There were 129 persons entirely supported, and 413 partially supported by charity. The emigration, which averaged 65 persons a year in 1856-58, had decreased to 45 in 1863. It is said that the former larger number was owing to the attraction of California, and the higher number in 1859 to the mobilization of the army when some fathers of families evaded the army by emigrating. Area. Population. Births. Emigration.

As regards the persons occupied in agriculture there were— Agricultural population.

Of persons solely or mainly occupied—			
Owners	1,815	with 6,452 relatives and dependants.	
Tenants	34		
Of persons auxiliarily occupied—			
Owners	1,119	with 4,189	„ „
Tenants	25		
Making a total of	2,993	with 10,641	„ „

There were also bailiffs, farm servants, and day labourers to the number of 4,043, with about 10,000 relatives and dependents.

The population connected with land can, therefore, be estimated, at about 28,000, leaving some 4,000 only unconnected with land. This is in respect of occupation, not of proprietorship.

60. The distribution of the area into different kinds of land and into properties is as follows:— Kinds of land.

	Acres.		Acres.
Sites and gardens	2,001	Waters and ditches	1,197
Plough land	82,848	Other land for common purposes ..	714
Meadows	4,692		
Pasturages	1,601	Total	100,369
Wood land	3,515	Forests of privileged estates and of communities	7,162
Barren land	932		
Roads, &c.	2,869	Total	107,531

Properties.	No.	Properties.	No.
Of 400 acres and more	25	Of 3½ to 20 acres	2,561
200 to 400 acres	20	3½ acres and less	2,587
20 to 200 „	807		
		Total	6,000

Distribution of property.

Of these there were in the country—

Properties.	No.	Properties.	No.
Of 400 acres and more	23	Of 3½ to 20 acres	2,053
200 to 400 acres	19	3½ acres and less	1,788
20 to 200 „	771		
		Total	4,654

Each of twelve classes of tillage is represented; but the greater portion of the area falls into classes 2 and 3.

The meadow land has probably much diminished in acreage since the above statistics were collected.

Team-requiring farms.

The team-requiring farms (of 16 acres and more) numbered 875, with 31,400 acres, as against 781 in 1816, with 26,440 acres. The average size of such a farm in 1859 was 36 acres, as against 34 acres in 1816. They have, therefore, materially improved their position in spite of the equal division of land. Only one-tenth of the area of the department is not freely alienable. Some 20,000 persons (or at any rate persons entered), with 83,000 acres, have benefited by the abolition of all charges and services and extinction of commons.

Taxes.

Income-tax is paid by about 100 persons, and class-tax by 11,500. The taxpayers in each case are slightly increasing in number and payments.

Industry.

The large industry, apart from agriculture represents scarcely 3,000 of the population, and is chiefly located in Langensalza itself.

Justice.

Before justice the position of the population had improved in three years to 1862, and was not unfavourable in 1860.

Statistics of Altengottern.

61. With respect to Altengottern, the chief statistics are the following:—

Population	1,556	Private houses	322
Public buildings	11	Stables, barns, &c.	773

Nearly all the farms and buildings are insured. The population is entirely agricultural. There are two privileged estates subject to feudal descent.

The team-requiring farms have diminished: thus in 1816 there were 50 of 1,220 acres; in 1859, 41 of 1,120 acres.

The land-tax produces 370*l.*, and the class-tax 185*l.* Only a few persons pay income-tax.

The distribution of the kinds of land is as follows:—

Kinds of Land.	Acres.	Kinds of Land.	Acres.
Tillage	3,560	Roads, &c.	176
Meadows	653	Waters and ditches	121
Pasturages	36	Sites and gardens	193
Wood land	2	Land for common uses	20
Barren land	118		
		Total	4,879

Producing 4,285*l.* in net returns of Land Tax assessment.

The greater part of the meadows and pasturages is now plough land.

The agricultural position in respect of the plough land may be estimated from the fact that—

	Acres.		Acres.
In the 1st Class are	280	In the 5th Class	550
„ 2nd Class	540	„ 6th Class	420
„ 3rd Class	585		
„ 4th Class	610		2,985

leaving scarcely 600 acres for the remaining five classes represented.

The Communalty possesses 150 acres, an inn, a bakehouse, and a poor-house. It has 1,350*l.* of debts; of which 825*l.* are old war debts, and 425*l.* for the inn and turnpike-road.

In respect of live stock Altengottern possesses, except in horses, many more than formerly. In 1862 the village possessed,

Horses	99	Pigs	300
Horned cattle	614	Goats	232
Sheep	2,125		

There are two churches and three schools. The former are in the gift of private persons. They possess a capital of about 400*l.* The incumbents possess 120 acres of glebe land. The income of the one is calculated at 154*l.*, and of the other at 90*l.* The schools possess 20 acres, and a capital of 65*l.* The income of each of two teachers is calculated at 49*l.*, and of the third at 45*l.*

(β.)—The Division and Subdivision of Land.

Sub-division of land.

62. What the subdivision of land formerly was, can be estimated by referring to the statistics of the parcels of Altengottern and Grossengottern, mentioned in paragraph 4 of Part III of this Report. The lands of these villages were the most subdivided, but other

lands approached them for smallness of the parcels. No village possessed its lands in an advantageously compact shape. But the subdivision of land in this department has been remedied by the application of the compulsory consolidation in connection with the extinction of rights of common. There is scarcely a communalty which has not already received the benefits of such a consolidation. Of the former number "of parcels," I was unable to procure full information. But, although the subdivision was not as great as it is in Wetzlar, it was very minute, especially in certain districts. The lands of Altengottern were the most subdivided. Four-fifths of the area of the department has been readjusted, and carefully laid out in a practical manner.

Division of land.

63. As to the division of land into property, the first remark, as betokening the difference between this department and that of Wetzlar is, that whereas in the latter only one-fortieth part of the properties ranged in size above 20 acres, here one-seventh thus range, and in the country more than one-sixth thus range. The second remark is, that the team-requiring farms of 16 acres and more, have considerably increased since 1816. Yet these lands have been for several centuries subject to the equal division on inheritance of land. The reason is probably, that a greater prosperity has attended the freer agriculture of the department, and that this prosperity has been produced by more favourable conditions of soil, climate, and position, as well as by other causes arising out of the diligence and forecast of the peasantry, by the land improvement, and by the absence of the system of field compulsion. The very prudent marriages of the children have restored the family equilibrium, disturbed by their births; and the careful economy of all has enabled many families not only to hold undiminished, but even to increase, their paternal acres. The small industry of the department cannot be credited with any important share in this result.

Lastly, it will be noticed, that the distribution of property is of such a nature as to allow to the smaller peasant proprietor the opportunity of watching the results of innovations on the larger farms, and of profiting by them.

Land in Altengottern.

64. With regard to Altengottern, in which village there is not a house without land, other than a garden, belonging to it, the distribution of property follows in the main the description of the department. But the team-requiring farms have diminished by as many as one-sixth since 1816. It is one of the few villages of the department in which an increase has not taken place in the number of the farms. I could obtain no satisfactory reason for the diminution, except the usual working of the custom of equal division of land. It is curious to note, that in the adjoining village of Grossengottern, the team-requiring farms had increased in number by 10 per cent., and in acreage by 45 per cent.

(γ.)—*Its Agriculture.*

Advantages of Department.

65. The department of Langensalza has, in the three essentials of agriculture—climate, soil, and position—some advantages over the department of Wetzlar. It has also advantages from the land improvements effected, and from the earlier opening out of its land by turnpike-roads; from the extinction of commons, and from the compulsory consolidation of intersected lands; and also from the improved system of agriculture. The consolidation has produced a higher kind of cultivation, and consequently increased the value of the land. It has thus benefited the peasant; but it has also benefited the State, for it has enlarged the basis of taxation, and increased the security for the taxes. Moreover, the smaller peasant proprietor have in this department the opportunity, from the existence usually of several large proprietors in each district, of observing any improvements introduced, and the subsequent results obtained by them.

Former and existing disadvantages.

66. As will have been seen, from the statistics in paragraph 60, the department is almost bare of forest, and chiefly appropriated to tillage. The existing woods are only on elevated spots, and a tree is, off the turnpike-road, or outside the village, rarer on the undulating crop-bearing area of Langensalza, than it is on the undulating grass-bearing territory of the Banda Oriental. The absence of woods has doubtless helped to increase the mischievous floodings of the rivers. The higher land was washed down, and the lower land was raised. Man's ditches disappeared, and the water dug its own ditches. Hence, harvests were lost in autumn, and swamps remained far into the summer, if not all the year round. All this has been for the most part changed. In 1860 a compulsory association was formed for the regulation of the upper part of the River Unstrut, and its area of operations included this department. The benefit derived from this improvement has been very great along the ten English miles of the Unstrut, which were regulated together with the subsidiary streams.

System of cultivation.

The three-field system of cultivation is still to be found in a few isolated spots—on spurs of the Eichsfeld—but will soon have disappeared. In the plain, and in the greater

part of the remainder of the department, a free system of cultivation obtains, of which the character is in some parts determined by the proximity of Erfurt, the great central market for commercial plants and vegetables. The large farms have also five, or six, or seven, or eight courses of shifts, and give more and more attention to forage crops, and to suitable rotations. Even where the peasant farms do not deviate much from the three-field system, they employ either four courses, or the three-field with occupied fallow. Hoed crops are becoming general, and a better working of the ground follows as a matter of course. Horses are used for farm work. But in the quite small farms cows can alone be used for ploughing, and other farm work. Improved implements are to be seen; but much yet remains to be done. Steam threshing-machines have been purchased, and the whim threshing-machines are much employed. Manure is often well managed, and earth and gypsum often scattered over it to retain the ammoniac liquids. Manure-water is not always allowed to run away. Stall-feeding prevails. Guano is too dear for employment. Marl is not to be found in the neighbourhood. Gypsum is used on clover.

Taking the department as a whole, the crops are thus distributed on an average of years:

	Per cent.
Winter crops (wheat and rye)	25
Summer „ (barley and oats)	20
Pulse „ (pease and beans)	7
Potatoes	3
Roots	1
Meadows, clover and other forage crops	20
Oil and spinnings plants	4
Fallow and pasturage	20
	100

The cattle are not always fully fed. Horned cattle are very seldom, sheep rarely, but pigs generally, fattened for slaughter.

Agriculture of Altengottern.

67. Altengottern is one of the most advanced villages in agriculture, and one of the best situated. It also grows mustard, aniseed, and other commercial plants. It has largely profited by the regulation of the Unstrut; and its lands, though devoid of shelter from any woods, are well placed. The pasturages have disappeared since the regulation of the river and the extinction of commons. Plough land is more profitable. The quite small peasants employ spade husbandry with great success. The lands of the peasant proprietors were in good condition. No amount of labour in spudding out weeds is spared. On the whole the land of the smaller proprietors was cleaner and more carefully tilled than the land of the larger proprietors. The ploughing seemed always to be shallow. Drill machines are almost universally used. Finally, it should be remarked that the soil is a very good loam in most parts of the lands, and the depth of staple soil is very favourable.

Advantages of consolidation.

68. It is less easy to describe than to see the advantages, which the consolidation of numerous parcels into compact holdings has conferred upon the agriculture of a village like Altengottern. A glance at the plan of what the subdivision of land formerly was and what the division of land now is, is sufficient to obtain an idea of those advantages. But plans cannot be reproduced in this report, and the various references herein to those advantages in general must suffice. The laying out of useful accommodation ways, and the bringing numerous parcels into two or three compact holdings of serviceable shape are amongst the chief of them. The peasant proprietor can now usually enter his property from one of two accommodation ways. It is thus clear that the disadvantages of the opposite state of things, such as exists in Wetzlar, have been entirely removed; and hence agriculture has a freer field to flourish in. The peasant proprietors are in a position to obtain, without waste, full returns from their land; and, as the reward of intelligence and diligence can be fully reaped, each peasant is spurred to the fullest exercise of those qualities. With scarcely a dissentient voice the peasantry of Altengottern praise the consolidation and its results. As the plans do not accompany the report, it may be remarked that the land in such cases of consolidation is laid out as far as practicable in square portions along parallel accommodation ways in order to obtain the greatest advantage. It would give much pleasure to many an intelligent agriculturist of England to notice how very little waste of agricultural power is caused by the outward arrangement of such consolidated lands as those of Altengottern. It would scarcely give him as much pleasure to notice that, excepting in the village, and in addition to a clump of trees near a pond, there is throughout the 4,879 acres only "*The* lime tree." The absence of hedges and trees too makes the prospect in winter rather bare.

(δ.)—*Its Industry.*

69. Under this heading there is little to be said. The statistics in the (*a*) section have shown how predominant agriculture is. The industry consists of three wool-spinning and one cloth-making establishments, employing 647 working people, besides two small manufacturing establishments. There are some 200 hand looms (besides 300 in household employment) worked in the department by 143 masters and 39 apprentices and assistants for weaving linen and cotton and half wool tissues. The various other industries, either connected with the above manufacturing industry or with agriculture, employ some 300 working people. There is only one small distillery, but as soon as the new railway from Gotha through the department to Mülhausen is opened, the farmers expect to see distilleries established to the advantage and profit of agriculture. But in this they may meet with disappointment, for it is by no means certain that, even if established, distilleries would render the position of agriculture better. Some reckon too upon the introduction of the beetroot sugar industry into the southern part of the province. But it is not clear that the soil is of such a quality as to enable the beetroots to compete with those of the northern part.

It is obvious from these few remarks that the manufacturing industry of Langensalza has very little influence upon its agriculture.

As regards Altengottern, there is no manufacturing industry nearer than Langensalza itself. The only agricultural industry is a small flour and oil mill, with eleven inhabitants, outside the village on the Unstrut.

(ε.)—*Its Population.*

70. It will be best to commence this section by a sketch of the village of Altengottern, and then to add a few remarks respecting the department in general.

Altengottern. Changing lands

Altengottern includes two large privileged estates farmed by their owners, one large estate farmed by a tenant on long lease of twenty-four years, and the peasant properties, which consist of the so-called changing lands; the property of the communalty, incumbents, churches and schools. This latter kind of property is usually let, mostly in small portions. The large portions are on twelve years' lease, and the smaller sometimes on six years. But most of the tenants of such lands are the peasant proprietors themselves. There cannot be said to be any class of agricultural tenants. Neither does a large agricultural tenant prefer to remain a tenant. He becomes an owner as soon as he can. It does not appear that there is any striking difference between the farming of the large agricultural tenant and the larger proprietary farms of the village. He does not appear to farm higher or to lay out more circulating capital, than proprietors of a similar area. As regards the smaller tenants there is no perceptible difference. As peasant proprietor they farm the owned and hired land alike, but the latter with less care for the future. As real tenants they endeavour to obtain the largest returns within the period of the lease, and to leave the smallest possible value for the owner. In a long series of years the self-farmed land of an owner is in much better condition than the land leased to tenants, certainly for twelve years, and even for eighteen years. Unless there be a security for renewal, equal to the security of ownership, there will always be in the longest leases a period when the land will be badly treated. The State is giving up leases of twelve years and even of eighteen years. Minute restrictions on the freedom of farming are clumsy expedients for preventing this deterioration, and hence the leases of Prussia generally allow freedom of farming. In Altengottern there seemed to be no tenant on free alienable land.

Day labourers.

71. But if there be no class of agricultural tenants renting land from large landowners still less is there any class of mere day labourers. They are nearly all landowners, and take work as day labourers in greater or lesser quantity, according to their needs. Their usual diet is not as good as that mentioned in paragraph 85 of Part III for the Province of Saxony but they have their meat twice a-week. It has been calculated that a labourer's family must spend in this part of the province yearly, according to its size, from 13*l.* to 20*l.* in food, firing, clothing, direct taxes, rooms, and other necessaries. If the men receive 1*s.* without board a-day and the women 9*d.* the wage is high. But he does not, of course, work every day for wage. These wages are double what they used to be twenty years ago. The artizans of Langensalza itself earn, on an average, double the day wage of the agricultural labourer.

Peasant proprietors

72. The quite small peasant proprietors, although they be not day labourers, do not live any better than the latter. Even the more independent peasants live in the plainest manner, although they usually have meat daily. They certainly lose nothing by any superfluity of diet. The general position of the proprietary peasantry is considered to be prosperous ("wohlhabend"). Their greater prosperity since the operation of the National

Agriculture Legislation and the regulation of the Unstrut does not diminish their usual economy; and hence the formerly independent peasants are laying by large sums, and the formerly dependent peasants have become independent. This prosperity may be further increased by the railroad. Hence, if further division of property in land should take place the increased prosperity may counteract its influence, or, more accurately speaking, would enable it to take place, for a time, without diminishing the number of independent families. This number is now considerable. As in the province of Saxony generally, so in Altengottern; it is the middle proprietors who constitute the important part of the economy. This has already been seen in respect of the department of Langensalza by the statistics of the (*a*) section, and it is regrettable that it is not possible to place this in figures also for Altengottern. It is also regrettable that it is not possible to set forth the distribution of property fifty years ago, and consequently to compare with it the present distribution.

sults of division land.

But, as in the case of Wetzlar, the precautionary statement must be made that the present distribution has not replaced a distribution into large properties. Possibly the quite small properties of the day labourers are proportionately more numerous than formerly. But if centuries do not suffice to create a greater proportion of such properties than now exist in Altengottern and such villages, it may be doubted that the free and equal division of lands produces as many evils as is often supposed. When one sees that a long succession of such division, accompanied also by minute subdivision and wide dispersion of the portions of each property has failed to reduce the population of such a community as Altengottern to misery, the doubt arises as to whether, in a district always subject to such a custom, the distribution at the end of one century, or even of half a century, is, *cæteris paribus*, essentially different from the distribution at the beginning. Such a comparison would be interesting; and if at any time I find an opportunity of instituting one, I shall avail myself of it. It does not seem to be even true that the families change much in such a village. The inhabitants are, for the most part, descendants through many generations of former inhabitants.

But if the facts as regarding such populations as that of Altengottern seem to warrant the inference that equal division of land, as distinguished from equal subdivision of each portion of land which is evidently most prejudicial, does not necessarily, after centuries of operation, produce pauperism or great poverty unless extraneous causes of adversity operate, it is only fair to enumerate, in respect of Altengottern, the various extraneous causes of prosperity which may have aided in reducing to a minimum the alleged evils of equal division of land. The population, although it consisted of freemen and not of serfs, was, before the Stein Hardenberg Legislation, subject to real charges and services. These have since been commuted, and the commutation which is now paid off, has no doubt aided them to become more prosperous. Then the already-mentioned extinction of commons, consolidation of lands and regulation of the Unstrût must be remembered as aiding them to become prosperous. The full effect of the last three causes of prosperity has not yet been felt. They have had little to do with the maintenance of a favourable condition of the proprietary peasantry during this half century and nothing during previous centuries. War must, however, be mentioned as having had an influence, but this influence would be difficult to estimate. No doubt it would act in two ways; adversely, inasmuch as it would destroy accumulated labour, and prosperously (afterwards for the survivors) inasmuch as it would have thinned the population. Where equal division of property in land obtains, the latter would probably do more to counteract extreme distribution than the former would do to plunge the population into misery. It may astonish some readers to observe that the influence of war is mentioned as an influence to be taken into account. Whatever evils isolated England may have suffered from war she has not suffered from fire and sword carried into her homesteads. In Germany, on the contrary, whole villages have thus disappeared, and the devastation of others has been terrible. If, therefore, the results during centuries of the operation of a law or custom in respect of land be calculated, war must enter as one of the factors. It may be considered that in such villages as Altengottern the nett result of equal division of land under favourable circumstances may be seen, and in such villages as the one near Wetzlar the nett result of equal division of land under unfavourable circumstances may be seen. The population in the former case are prosperous, and the middle peasantry are numerous; the population in the latter case are barely able to keep their own, and the middle peasantry are relatively little numerous.

nimum land for easant family.

73. It is important to ascertain what is the minimum quantity of land which will enable a peasant proprietor to maintain his family. In Altengottern a minimum of 6 acres will suffice. With regard to farm work, a small proprietor who has only one cow will arrange with a neighbour who has also only one cow, to use the cows together for ploughing and other work. The usefulness of small parcels in Altengottern is this, that it preserves the village from the presence of a labouring class separated from the land.

Consequently, too, a case of a soldier not returning after service to resume his village life, is very rare. They all come back, and never emigrate. The land is firmly held, and whatever does come into the market is bought by the peasants themselves. In the neighbouring village of Grossengottern a large privileged estate was dismembered and sold in small portions. It was, so far as I could learn, purchased by the peasants. The average price per acre was 56*l.*, which, compared with the prices of 15*l.* to 36*l.*, taken from the mortgage-books, shows how untrustworthy (from a desire to diminish the law costs) such prices are. But there is also a reason for the high price of 50*l.*, viz., that the purchasers formed themselves into an association, and under a joint guarantee undertook to pay the purchase-money in instalments over eight years. For the railway, land in the neighbourhood has been sold at 90*l.* an acre. Little land in market.

74. Marriage is a partnership between persons entitled to the same amount of land, or thereabouts. So long, therefore, as two children only succeed to the parents' land, the family maintains its position. If there are more children and the parents are able to save in proportion, the same result is attained. These are two types of cases, which frequently occur, and evidently materially aid in preventing a prejudicial result from the equal division on inheritance of property in land. It is very seldom that a family is obliged from reduced circumstances to leave the village. Neither is there any permament pauperism. Hence it may be inferred that deviations from the two typical cases are comparatively rare. There is a small house for paupers. In 1863 there were six inmates, at a cost of 3*l.* 15*s.* only to the poor-funds, from which 10*l.* were also distributed to poor persons, and 30*s.* for tending the sick. The communalty paid another 30*s.* for the paupers, so that pauperism only cost 17*l.* 5*s.* to the village. At present it is much less. There were only twenty poor school-children in the village. The cost of their schooling should be added. Marriage. Poor.

There are, consequently, very few peasants in deep poverty. The land of orphans is tilled by kind neighbours in the absence of relations, and not unfrequently poor orphans are adopted. The villagers have very few debts; on the contrary, the majority are accumulating money, which they invest in mortgages and lend on personal security, and rarely hide in stockings and mattrasses.

If Altengottern is rich in schools, it is also well provided with the means of social amusement. It has two dancing rooms, and in the neighbouring village a small *café chantant*. Dancing is a frequent amusement, and is looked upon as a necessary recreation. In this respect such a village shows a conformity of spirit with the Rhenish peasantry; and, on the other hand, differs in its public opinion from a characteristic village of Westphalia The recreation of a reading-room does not seem to be known or appreciated. The peasants do not read much, seldom have books other than their church books, and only subscribe to one or two weekly journals. At the inn they read the daily journals, and learn the news of the day, and spend their leisure time in conversation. The inn seems to form a kind of club for them, in which, however, they abstain from the excesses formerly too common to the English agricultural population. The peasant's ideas are rather restricted. Beyond his own immediate sphere he knows little, and at present he seldom sets a value on education for his children in addition to the compulsory primary instruction which they obtain. Even in politics he has few ideas, but those few are happily the reverse of social democracy. In religion he is usually liberal minded, and thinks that it matters little whether one be born and remain Roman Catholic or Protestant. He echoes the sentiment of the former King of his country, Frederic the Great, who considered that each man's religion should be equal before the State. He is certainly an independent member of the community however little may be his stake in the land, and needs no paternal protection. But his independence is in no wise obstructive to the descendants of the former lords, whereas, in his dependence his interests and the lord's were opposed, and unpleasant relations were the result. Now the relations are agreeable, and the natural influence of the gentleman land-owner has a clear field, and is consequently very great. There is little doubt that Prussian subjects have been overgoverned. From this fact arises the want of initiative which almost universally characterizes the peasantry. They are in most things helpless, and require to be made to move. The new system has not yet had time enough to make a change in this respect. It is, however, doubtful that even in this respect they compare unfavourably with the peasantry of other lands. The intelligence and intellectual initiative of the peasant must not be judged by some arbitrary standard of excellence. Other things being equal, is the Prussian proprietary peasant more wanting in in these respects than the English tenant farming peasant? In a comparison of the system of agricultural tenants and peasant proprietors, the Prussian peasant must be judged by comparison not by an arbitrary standard. Their social good qualities are many. They are industrious, prudent, economical, honest and sober-minded. Their morality is high, and cases of illegitimate births are rare. Amusements. Restricted politics and other ideas.

In stating there was no pauperism, the facts that ragged clothing is not to be seen, Clothing.

Houses.

and that houses out of repair are not to be met with, are also stated. The peasantry dress plainly, but always respectably. The houses are kept in good order. They have not any superfluity of space; and even the owner of fifty acres has a house in which the living room is also a sleeping room, and the furniture is only just the necessary furniture, with a cane couch and a spinning-wheel.

Soldiers.

Such villages as Altengottern provide the best and the most soldiers. The villages of the proprietary peasantry are usually admitted to be the great nurseries for the army. It is considered too in Altengottern, that the temporary withdrawal of labourers for military service does not do much harm to agriculture. There are numerous proofs that the peasants who have been soldiers have been much improved by passing through the service, and that they help to raise the standard of their villages when they return. The benefit conferred by the military system in this respect is very considerable. The advantage to the man himself does not appear to bring him any pecuniary reward, but gives him a preference over others, which is valuable.

Population of Department.

75. With regard to the department, this description will apply to many villages, some of which are in a better position than Altengottern, but will not apply in its entirety to other villages on the higher land with unfavourable soils. There, in spite of the same industry and economy, poverty is scarcely warded off from the village. One may go through such a village, and may remark that in this house there are no children, in the next only two children; in that house one child, in the next none at all, and so on, and may inwardly note the fact that the clinging to the land has produced this exceeding great prudence and forecast in marriage. Yet such a village may require only a small additional weight in the scale to destroy the equilibrium so carefully kept. This, however, is an exceptional case, which is, happily, rare. Its rarity may be inferred also from the fact that the poor persons, freed from taxes because of their poverty, are only about 3 per cent. of the population, and have diminished since 1859. Such poor persons are about 5 per cent. of the urban population, and only 1½ per cent. of the rural population. The children, who form more than one-third of the number, are included.

In conclusion, it is very remarkable that even in a town like Langensalza, where manufacture has no extended influence, the small manufacturing class is distinguishable from the agricultural class by its want of prudence and economy. They spend freely when they earn well, and they are plunged into poverty when they earn badly. They hastily marry, regardless of consequences; whereas the peasantry prudently marry, with a careful regard for results.

(ζ.)—*General Observations.*

76. It requires few remarks to complete the summary of notes and observations in respect of this department. The condition of the department shows strikingly the beneficial results of the part of the National Agriculture Legislation relating to extinction of commons and to consolidation of intersected lands. It manifests not less strikingly the phenomenon of a landed peasantry prospering after the influence during centuries of free alienation of land, and of equal division on inheritance of land. It seems also to warrant the inference that a proprietary peasant is, by the fact of possession of the land, rendered exceedingly prudent and foreseeing, and is instinctively impelled by the interests of the family to manifest an unconscious observance of the economic law which restricts the population of a given district to the number which can be sustained by the produce of that district. He contributes his mite of experience to show that mere increase of population is not necessarily wealth, and that a stationary population may be a sign of constant care and comfort, and the result of careful preservation of property; whereas an increasing population may be a sign of fluctuating means, and the result of careless dispersion of property.

arms in villages.

As to grouping the farmers in villages, which is prevalent here as in a great part of Prussia, it may be observed that they themselves do not think it disadvantageous. A middle peasant proprietor may frequently have to walk a couple of English miles or more to his field, and to take the implements to and fro. This is evidently a loss of time and a waste of labour. But the arrangement cannot now be altered, and it is difficult to see how it could be advantageously changed. The village life may cause greater sociability in the peasant proprietors, but it may also help to confirm each in his individual life of little movement.

aw of indefeasible heritance.

87. As to the influence of the law of indefeasible inheritance, it is not required, for no peasant proprietor ever thinks of restricting the inheritance of a child to the legal minimum. All children inherit equally, whether or not they have remained on the farm. In connection with inheritance there is a curious custom beyond the Prussian frontier in a Saxon district. The peasant proprietor's daughter gets the farm, and the son must obtain another by marriage!

(e.)—*Department of Mülhausen.*

78. This department adjoins the department of Langensalza on the north and includes a part of the Eichsfeld plateau, which has an average height of 1,000 feet above the sea level. Mülhausen itself lies much higher than Langensalza and Altengottern. But it is not necessary in this or any other case to enter into any physiographical details.

(a.)—*Statistics.*

79. The area is rather over 8 square geographical miles. The population has increased since 1793 by 41 per cent., and from 47,000 in 1858 to 50,000 in 1864, showing a density of 50 per cent., which is greater than that of the Province. The rural population is double the urban, which is chiefly in Mulhausen itself. Area. Population.

The importance of each of the chief occupations of the population can be seen from the following figures:— Occupations.

Persons occupied in agriculture solely or mainly	1,538
Ditto auxiliary	1,389
Ditto as agents, labourers	3,072
	5,999
With relatives and dependents	15,000
Total	20,999

In industry there were 8,039, and in commerce 2,407 persons occupied in 1861.

In 1859 to 1864 an annual average of eighty-eight persons emigrated, of whom one-half proceeded to North America. The immigration reached only fifteen a year. The births exceed the deaths (in 1863 by 112) and the excess seems to be increasing. The illegitimate births are decreasing in the country but increasing in the town in absolute number. In the former the proportion is 1 in 20, in the latter 1 in 10. The number of inhabitants per house varies from 4·75 to 8·48, and the average is 6·52. Emigration. Births.

80. The department contains the following quantities of each kind of land:— Kinds of land.

	Acres.		Acres.
Tillage	77,085	Waste and barren land	69
Garden land	1,216	Roads, &c.	2,946
Meadows	3,265	Rivers, &c.	870
Pasturages	4,268	Sites, yards, &c.	1,533
Forests	27,010	Total	118,262

In 1859 the distribution of property in land was as follows:— Distribution of property.

Of 400 acres and more	23	properties, with about	23,000 acres.
200 to 400 acres	14	„ „	4,000 „
20 to 200 „	959	„ „	45,000 „
$3\frac{1}{2}$ to 20 „	2,816	„ „	32,000 „
Less than $3\frac{1}{2}$ acres	5,407	„ „	14,500 „
	9,219		

Among 23 over 400 acres are the property of the town Mulhausen of 8,900 acres, (chiefly forest), the State forests of 3,160 acres, a privileged estate of 2,030 acres subject to primogeniture, another privileged estate subject to feudal descent, and an estate in *fidei commissum*. All other properties, except the estates of the various communalties are freely alienable.

The paupers numbered annually 348 adults and 310 children, and cost 550*l.* to the poor funds. The education of poor school children in the town cost about 630*l.* for 570 free children and for 670 admitted at reduced fees. Paupers.

The population compares well with other populations in respect of observance of the law.

The direct taxation of which the incidence is about 5*s.* per head produced the following returns in 1864:— Taxation.

	£
Land tax	4,740
Income tax	900
Class tax	4,490
Industrial tax	2,100
	£12,230

The industrial tax has increased and the class tax diminished since 1859. Only 142 persons (of whom 111 in the towns) paid income-tax. The class tax was paid by 12,514 persons at 1*s.* 6*d.*, 544 at 3*s.*, 1,998 at 6*s.*, 878 at 9*s.*, and by 2,129 at the higher rates. Of the industrial tax 790*l.* were paid by the pedlars.

attle

The number of cattle of all kinds is as follows :—

	1858.	1861.	1864.
Horses	2,354	2,470	2,775
Cattle	8,463	9,027	10,030
Sheep	26,858	35,501	38,104
Pigs	7,817	7,638	11,579
Goats	2,574	4,215	4,169

(β.)—*The Division and Subdivision of Land.*

ubdivision of nd.

81. I am unable to put the subdivision of the land into figures. The plans for its consolidation are being prepared, but many difficulties have been encountered, and a few have not yet yet been surmounted. The department is therefore still suffering from the evils of minute subdivision of property into parcels. and of rights of common. In these respects it forms a striking contrast to the neighbouring department of Langensalza. The subdivision is great, though the parcels have not attained the exceedingly large number and minute size of those in Altengottern of old. There are, however, meadow parcels, in which one sweep with the scythe mows the whole width ; and tillage parcels, in which two or three furrowings by the plough complete the width ; and forest parcels, in which 10 paces compass the width. In each of these cases the strip may be half an English mile long. The custom is here, as elsewhere, to subdivide on inheritance each portion of land, instead of dividing equally the inheritance of land. There is, however, no possibility of changing this old traditional custom. Public opinion alone may, in a long course of years, change it.

Division of land.

82. The division of land into property is not quite as favourable as in Langensalza. There one-seventh of the properties are larger, here scarcely one-eighth are larger, than 20 acres. But this difference is slight, if the more unfavourable conditions of Mulhausen, as hereinafter mentioned, are considered. There is a greater difference in the distribution of properties under 20 acres. There an equal number of properties, from $3\frac{1}{2}$ to 20 and under $3\frac{1}{2}$ acres, is found, but here one-third only are of from $3\frac{1}{2}$ to 20 acres, and the remaining two-thirds are under $3\frac{1}{2}$ acres. Thus the very small properties are twice as many as the small properties. The fact that Mulhausen is a large manufacturing town of 17,000 inhabitants, and that Langensalza is a small and mainly agricultural town of 4,500, will account for much of this difference, inasmuch as a larger manufacturing town renders necessary, without corresponding disadvantage, a more extended division of the land than can advantageously prevail near small country towns. If, too, the industrial history of Mülhausen, as hereinafter noticed, be considered, the difference in respect of the distribution of property under 20 acres ceases to be so astonishing.

On the contrary, it is rather astonishing to find that the middle proprietors have held their own so well. Thus the team-requiring farms had increased in 1859 by 87, or 12·18, over the number in 1816. The 782 such farms, in 1859, contained 28,381 acres, and the 4,539 non-team-requiring farms contained 23,881 acres. Many of the non-team-requiring farms would be of a sufficient size to maintain the family of the owner, but the statistics do not furnish sufficient data for separating them from the others, It will also be remembered that the lands of the peasants here, as in Langensalza, have been for ages the so-called "Changing Lands," subject to the freest alienation and movement.

Movement of properties in ten years.

It will not be without interest to subjoin the following Table, showing the movement in number and area of the various sized properties, from 1849 to 1858, in triennial periods.

Years.	Agricultural and Forest Properties yielding a return.										Number of Properties.	Total area of the Properties.
	Of 400 acres.		Of 200 to 400 acres.		Of 20 to 200 acres.		Of $3\frac{1}{2}$ to 20 acres.		Of less than $3\frac{1}{2}$ acres.			
	No.	Area.	No.	Area.	No.	Area.	No.	Area.	No.	Area.		
		Acres.		Acres.		Acres.		Acres.		Acres.		Acres.
1849	18	..	8	..	859	..	2,510	..	3,922	..	7,317	98,011
1852	22	23,392	12	3,400	865	37,015	2,734	28,889	4,111	6,525	7,744	99,221
1855	21	22,949	13	3,828	900	37,286	2,693	28,429	4,825	7,011	8,452	99,503
1858	23	24,525	14	4,080	959	37,328	2,861	25,336	5,407	7,400	9,218	98,669

As the total areas differ, it may be assumed that the counting has not been quite accurate.

It will be observed that the properties under 3½ acres have continally increased in number and area, but in a less degree in area, so that the average size is diminishing. The increase in number is rather over 10 per cent. every 3 years. There were, however, some inaccuracies in the counting, so that this increase cannot be practically assumed to be true. It will also be seen that the large properties over 400 acres have increased in number more than in area; the properties from 200 to 400 acres have nearly doubled, whilst adding only 20 per cent. to their area; the properties from 20 to 200 acres have increased one-tenth in value, but not at all in area; and that the properties of 3½ to 20 acres have likewise increased one-tenth in number, but diminished in area. It is these latter which disappear to increase the quite small holdings on the one hand, and the larger properties on the other hand. On the whole, therefore, the properties over 20 acres are gaining in area upon those under 20 acres, at the expense of the properties from 3½ to 20 acres, and probably of the smaller of such properties, inasmuch as they do not suffice to maintain a peasaut proprietor's family by agriculture alone. The bond of attachment to the land is in these cases not so strong, and the property is more rapidly sold. Moreover, in such cases, the custom of equal division on inheritance must have a greater influence in destroying the unity of the property than in the case of larger properties, where savings and consequent acquirement of land may restore the balance destroyed by the equal division on inheritance.

(γ).—*Its Agriculture.*

Natural disadvantages.

83. The climate is raw from various causes, such as elevated position, propinquity of Hartz Mountains, and absence of protecting forests. In some parts even the cultivation of rye is endangered. In few places can barley be grown. The soil is exceedingly varied, and, on the whole, is less favourable than the soil of the department of Langensalza. This unfavourable difference consists chiefly in the greater quantity of loamy soil on the higher lands of Langensalza, and of clayey loam on the higher lands of Mulhausen. But each department has about the same per-centage of loam and loam passing into clay, both taken together. For the land tax assessment it was found necessary to divide the department into two districts of classification. That of the Eichsfeld, with 66,200 acres, only yields in net returns for the assessment land tax 15,000*l.*; whereas that of the Werra and Unstrut valley, with only 52,000 acres, yields 28,700*l.*, or nearly twice as much. In the first district there are 2,500 acres in the first class, with a nett return of 1*l.* 12*s.* per acre; but in the second district only 64 acres, with a nett return of only 1*l.* 5*s.* per acre.

Artificial disadvantages.

To these natural disadvantages of agriculture are added the prejudicial influence in some parts of the field compulsion, and nearly everywhere of existing rights of common, and also of minute subdivision of the properties into parcels.

Cultivation.

The three-field system is yet the rule with winter corn, summer corn or clover, and bare fallow. But the four-field often occurs with fallow, winter corn, clover, and again clover, or, instead of second clover, a grain crop and a green crop alternately. A mixture of wheat and rye is often used, especially in the Eichsfeld. On the few large properties there has been for many years, but only partially, a seven or nine course of shift. In the small properties freed from common and field compulsion and intersected lands the three-field system is fast disappearing. Pulse crops succeed well anywhere, and tares are usually sown with oats whenever a crop of them is desired. The demand is greater than the supply for exportation, and hence prices are good for corn of all kinds.

The following Table shows the gross produce:—

Year.	Wheat.	Rye.	Barley.	Oats.	Pease.	Rape.	Potatoes.	Hay.	Flax.
	Bushels.	Bushels.	Bushels.	Bushels.	Bushels	Bushels.	Bushels.	Cwts.	Cwts.
1860 ..	22½	18	20	36	13½	18	90	30	2¼
1861 ..	13½	22½	18	34	13½	25	108	30	3
1862 ..	11	21	16½	34	7	25	82	27	3
1863 ..	25	29	22½	36	7	25	147	28	2¼

The meadows are wet, and often swamps, and require much improvement. Stall-feeding has been introduced nearly everywhere. Some improved implements, especially drill machines, have appeared. In conclusion, it must be observed that the system of cultivation is advancing, and that bare fallow is disappearing.

(δ).—*Its Industry.*

Textile industry.

84. Manufacturing industry is of much more importance in this department than in Langensalza, as will have been seen from the figures in the preceding section. There are, chiefly in the town, 19 spinning mills with nearly 25,000 spindles, employing some 600 persons. There are also some 400 persons employed in the country in spinning combed yarns. In weaving there are for cotton and half-cotton tissues 943 looms worked by 969 persons; for linen tissues, 98 looms worked by 103 persons; and for woollen and half woollen tissues, 699 looms worked by 702 persons. There are in addition 200 looms worked as auxiliary occupation. Similarly there are for woollen and half woollen goods 6 establishments with 10 power and 203 hand looms employing 226 persons. The other industrial establishments are of much less importance. But the tanning industry deserves mention. Building stone is quarried, and clay is made into tiles and other wares. There are lastly the usual agricultural industries in about the usual proportion. The breweries have considerably increased in importance. The spinning mills have considerably increased since 1837, when there were only 4 with 1,270 spindles. It is said that the spindles have doubled since 1861. The spinning of combed yarns is a winter industry. This has diminished enormously during the last twenty years. Hand carding of wool was till fifteen years ago the chief occupation of the greater number of the men of the Eichsfeld district. The invention of machines has caused its annihilation. Several thousand persons were thus deprived of their accustomed occupation, and have mostly adopted weaving.

Other industries.

Former industries.

Neither the industrial schools nor the commerce of the department is within the scope of this report.

(ε.)—*Its Population.*

85. It is purposed to regard the agricultural population alone before looking at the industrial population and the combination of both classes. But it must be remembered that nearly the entire rural population is engaged, in however small a degree as regards many, in agriculture. It is estimated that three-fifths of the inhabitants of this department, or about 30,000 persons, are thus occupied in cultivatian of the ground. The difference between the estimate and the figures of 1861 arises from the exclusion in the latter of the numerous persons who emigrate for half the year, and also of many owners who have a small trade and cultivate the land by their families.

Tenants.

There is not only no class of tenants, but the agricultural tenants (64) are as few as in the department of Langensalza, and those (only 18) solely occupied in agriculture are fewer. Leases for twelve and eighteen years are customary, but the small properties are sometimes let for six years only, and plots near the town are now and then let for three years. The leased lands are usually lands not freely alienable. One exception of, however, comparatively rare occurrence seems to be, that a small peasant proprietor, who resolves to temporarily emigrate for a few years, prefers letting his small property to selling it. If he do not let it, he allows it to lie fallow, which is less beneficial to the community. There is also the exception arising from a gentleman proprietor farming one of his estates and letting his other estates.

Day labourer.

86. The day labourer is seldom without his small holding of land. In the town of Mülhausen his wage is from 1*s.* 3*d.* to 1*s.* 6*d.* a day without board, and in the country 9*d.* to 1*s.* The wages of the female labourers are one-fifth or one-sixth less. All wages have much risen within the last score of years. It is reckoned that one agricultural labourer must expend for his family from 15*l.* to 20*l.* a year, according to its size. But in places where the majority of agricultural labourers are not solely employed in agriculture, but have looms or some other industry, or make annual migrations, the expenditure for a family is from 50*s.* to 60*s.* a year less. On the other hand, it is much more in the town of Mülhausen, where the labourer of all kinds must on the average expend from 20*l.* to 30*l.* for the same purpose. This difference is no doubt owing in a great measure to the influence of the manufacturing industry.

Peasant proprietors.

87. With regard to the peasant proprietors it is to be noticed that, although the middle proprietors have maintained themselves, the smaller proprietors do not prosper. The pauperism publicly relieved is not much greater than in other agricultural departments but the poverty is greater. There are whole villages in very straitened circumstances. One immediate cause of this has been the annihilation of the wool-carding by hand which formerly maintained some 30,000 persons. In villages where no other industry has to some extent replaced the former industry, and even where it has, the inhabitants are in much distress. They possess, either by their own work or by inheritance, bodies weakened by the exercise of a noxious industry like the wool-carding, and are consequently unfitted to do field labour. Moreover, the existence of the former industry brought about a density

of population out of proportion to the local returns of agriculture. Hence, as soon as the industry ceased the excessive population fell into deep poverty. It is probably from the fact of its cessation without any industry immediately replacing it that the Eichsfeld custom of annual migration has arisen. Every year a large number of the peasants emigrate to the beet-root district in the north of the Province to work on the beet-root farms, and return home at the end of the beet-root season. It is mainly the men and youths of both sexes who thus annually migrate. Consequently the ties of family are loosened, homely habits are lost, and often steadiness of character disappears. And then the emigrants very frequently return after this six to eight months' migration with little or nothing saved for the winter. If, as is often the case, these annual emigrants are proprietors of land, the wife, who is left behind, does the best she can with the aid of the children, but the land is often badly tilled. The evils of this annual migration are many, and the authorities would be glad to stop it. It is rendered as difficult as possible; but a change in the economical position of the department will alone cause it to cease. If agriculture could be so practised as to require more labour, and if the manufacturing industry were to yet increase so as to find employment for surplus hands, this annual migration would cease. But as regards agriculture there is seemingly no hope from the possibility of extending its area, for during the late decades of this century there has been no important addition of arable land. and hence the probability is that the available area is already under cultivation. Relief will to some extent be obtained on the extinction of commons and the consolidation of intersected lands and on the consequent cessation of the antiquated system of cultivation with field compulsion in favour of an enlightened rotation of crops, for these will increase the returns from agriculture, and render a more intensified system of cultivation possible. It is obvious that the migration would not take place except to obtain advantages, even though many may return with very little or no savings. The advantages are a higher wage, a more independent life, and easier labour. As it is stated that from 500 to 800 persons could in some of the villages from which this migration takes place have found continuous employment, it would appear that it is not merely want of labour that causes the migration in every instance. As it further appears that sometimes labourers not of the department enter it to take such vacant labour, a little rise in the current wages may tend to check the migration. But at the same time a habit once formed is not easily cast aside, and hence it may be that, until the advantages of staying at home are considerably better than the advantages of such an annual migration, the habitual emigrant will wander out. To the individual, therefore, the advantages outweigh the disadvantages. But it may be doubted that as regards the State the advantages to the pockets of the individual outweigh the disadvantages to his steadiness of character and his home life. One fact is, however, clear, that although they enable the individual to lead a less indigent life, the aggregate result to the department of his domicile is no appreciable diminution of its poverty. Moreover, the beet-root employer will not employ the older men. Consequently they must eventually stay at home, and too often become a charge as paupers upon their department. Thus the north of the Province profits by their labour and by their prosperity, for they spend more of their earnings there than at home, and the department of Mülhausen, and probably the neighbouring departments suffer by their adversity in advanced years without having profited by their labour. This hits a blot in the organization of the relief of the poor, which is, however, far more exposed in the English organization. It is also to be remarked that these annual emigrants, who in 1866 numbered about 3,000 persons, are chiefly weavers who ply their industry in winter, and who, being either physically unable to perform real farm work, or, being both ignorant of most farming operations and unable to learn them, seek by way of natural selection the easier work on the beet-root farms.

Annual migration.

If, in addition to the preceding outlines of the condition of the population, the natural disadvantages of the department and the artificial disadvantages imposed upon it by the minute subdivision and the rights of common be called to mind, it will not be astonishing that the population of the department of Mulhausen is not, as a whole, prospering, even although its newer manufacturing industry is prospering.

In the case of the annual emigrants without change of domicile, the combination of industry and agriculture does not seem to answer. It would be better that they had continuous employment in the one or the other. When, however, the manufacturing labourer obtains a plot of land and cultivates it, the result is beneficial, and when manufacture and agriculture can be more equally combined without any periodical migrations, the result is likewise beneficial.

88. As the object of the visit to Mulhausen was to inquire more fully into the economical condition of a department so different from and yet adjoining that of Langensalza, by way of contrast to the results of the consolidation of intersected lands and of

the extinction of commons, and by way of seeing how far industry had influenced agriculture, and what were the reasons of the depression of the population, it is not necessary to enter into details with respect to the peasant proprietors, and to the many questions connected with them which have been and will be treated in recording the inquiries made in other districts. But it will be interesting to note that, in spite of the greater industrial influence that has had play in this department, the peasant shows as little capacity for taking the initiative in the simplest local matters as those in the neighbouring department of Langensalza.

Occasional ruinous price of land.

The peasants eagerly buy land, even giving mortgages to two-thirds of its value. But the purchase-money is frequently driven too high by competition, of which there was recently an instance in this neighbourhood, and of which the result is that the purchasers have been ruined. In such a case there are, however, two elements—the high price, and the want of proportionate capital on the part of the purchasers. Both act prejudicially, but the result cannot be fairly ascribed to the former alone. It is not unusual for the land to be purchased in many parts of the Kingdom at 50 to 80 years' purchase for agricultural purposes. Yet the purchasers are not ruined.

Probable usefulness of small portions of land for leasing.

89. I learnt that, according to most intelligent observation, the small proprietor in a district where he could hire some more land prospered in his farming, and in a district where this was impossible did not prosper in his cultivation. If, therefore, a peasant proprietor had the minimum of land requisite to keep his family from starving, the probability was that he would prosper or not according to the possibility of having a little more land. If it could be shown from experience that this would usually be the result, it would constitute a strong argument in favour of the presence in each neighbourhood of small portions of land which could be taken on lease by the small proprietors. *A priori*, it could be concluded that, as in agricultural economy the object to be striven for is the prosperous independence of each cultivator, if not of numerous cultivators; and as the non-independent small proprietor is too often unable to purchase land, and therefore only able to hire land, it must always be good and expedient in every way to provide such small proprietors with the greatest possible opportunity of so prospering. It would consequently be sound policy, when mortmain lands are in existence, to let them in small portions on long leases. It would also be commercially profitable, for, as the purchase-money of small portions of land is relatively high, so are likewise the rents of small portions of land. Another inference is, that it would not be sound State policy to turn all small holdings into holdings of absolute ownership, unlikely to be let on lease, and thus fail to provide small holdings which could be auxiliarily hired on lease. On the other hand, a similar result in favour of such small proprietors could be obtained by the principle of association. A sound association of self-help could provide the small proprietor with the means of acquiring the land and paying off the purchase-money in easy instalments. This would be preferable to the peasant always remaining a tenant for part of his land. But even the association could not always help him. The land must be in the market, which it seldom would be—on the spot, at any rate, where it was required. Herein, by the way, is a reason for promoting the greatest freedom of exchange in land, for in inverse proportion to the accumulation of inalienable lands in few hands will be the possibility af self-help in this direction for the peasant. The system of having leasehold lands in small portions contantly at hand has this advantage over the system of purchase by association—that it would always give a constant number of opportunities to such peasants to place themselves on a prosperous level. It is not, however, for this Report to extend itself to an attempt to weigh in the balance the economic advantages of such systems.

90. The preceding observations in this Section will have sufficiently shown the difference between the industrial and purely agricultural classes. The annual migration is not a phenomenon of agriculture, but of industry. The excess of population was produced by industry, not by agriculture. The restless relations of the department and the varying portion of its population are not attributable to agricultural, but industrial influences. There is no great difference between the agricultural and industrial classes in the country districts, in wages or other pecuniary relations, for the two classes are for the most part so intimately blended. Neither is the difference considerable in character and social relations. But the contrast between the purely agricultural population of the country and the mainly manufacturing population of the town is similar to the contrast in Langensalza.

One word as to the military capabilities of the Department of Mulhausen. The remark made in paragraph 74, in respect of Altengottern as representative of Langensalza, is fully borne out by the experience obtained in this department. It will suffice to generalize thus, that a purely agricultural district of peasant proprietors of 3,000 inhabitants will furnish more and better soldiers than a district, formerly or now industrial, of double the number of inhabitants.

(ε.)—*General Observations.*

Industry.

91. The department of Mulhausen can scarcely be cited as showing the influence of predominant manufacturing industry; yet its history takes a decidedly industrial hue. The depression of a large part of its semi-agricultural, semi-industrial population, is owing to the decline of former industries. The present hand industries are more or less precarious. It is only the large manufacturing industry, with the appliances of modern machinery, which seems to prosper. On the other hand, the middle peasant proprietors of the purely agricultural population are not unprosperous. Neither does the position of the small peasant proprietor of the purely agricultural population seem to be universally necessitous.

There is one—possibly small—reason for recent prosperity of peasant proprietors, or at any rate for diminution of the peasant's outgoings. It is that, by the change under the recent national agriculture legislation, from commutation in corn to commutation in money, the representatives of the lords of the manor lost, and the peasants gained, for the price has risen much since the normal prices of the commutation were fixed after 1848. The peasants have therefore not had to pay as much as they would otherwise have done, and to this extent they have been gainers by that change.

Covenant as to rotation.

92. The only instance I have yet met with, of restrictions upon the farming of a private tenant, such as laying down the rotation of crops, occurred in respect of the tenant of an estate in *fidei commissum*, of which one of the covenants rendered a mentioned rotation obligatory.

Reforesting.

93. This department offers an instructive warning as to the lasting loss occasioned by reckless devastation of woods. Not only does it suffer much damage from the absence of forests; but it is exceedingly difficult to stay the damage, and restore the equilibrium, for several attempts at reforesting for protection have signally failed, although carried out with intelligence and scientific knowledge.

(*f.*)—*The Provincial Districts of Coblentz and Magdeburg.*

94. These are grouped in the same subdivision, because it seems to be necessary only to select a few notes in respect of each for this Report. The culture of the vine gives its chief character to the first, and the culture of the beetroot to the second. But as neither the vine nor the beetroot* is ever likely to form a characteristic of the agriculture of any part of Great Britain, in which peasant proprietors may arise, the relations of these districts need not be treated so fully as the relations of the other districts visited. Yet there are some interesting points in connection with those relations, which will be found in the following sections.

(*a.*)—*Coblentz.*

Population.

95. This provincial district contained in 1864 a population of 533,095, of whom 426,250 lived in the country. The area of 109 square geographical miles, of which, however, a large portion is uncultivated or waste land, was divided into no fewer than 245,915 properties containing 4,250,000 of parcels, as has been already noticed in Part III. The distribution of them was as follows:—

Distribution of property.

Of 400 acres	498
Of 200 to 400 acres	345
Of 20 to 200 acres	7,483
Of 3½ to 20 acres	52,320
Of less than 3½ acres	185,269
	245,915

Thus there was a landed property to every 2⅕ persons of the population. Thus, too, the properties under 20 acres were twenty-nine times more numerous than those above 20 acres. The foregoing figures include the Department of Wetzlar, which is considered to be a part of the provincial district, and is treated at length in sub-division A. It will be recollected that in Wetzlar the proprietors below 20 acres are forty times more numerous than those above 20 acres. In the following departments these properties have the following ratios:—

Of Zell	80 to 1
Of Coblentz	50 to 1
Of Neuweid	33 to 1
Of Ahrweiler	31 to 1

* If beetroot do, the inquiries can then be made. In the meantime I have in paragraph [48] sketched the cultivation of a beet-farm.

The foregoing ratios are quoted merely to illustrate the great division of property. In the neighbouring provincial district of Treves the division, which is also great, reaches an average proportion only of 16 to 1.

The vineyards are estimated to contain about 20,000 acres out of the 1,522,000 acres. As vine-growing land allows of greater division than plough land without loss of a sufficiency of annual returns, the extreme division is in some measure owing to the presence of vineyards. This is most assuredly the case in the department of Zell, which comprises the greater part of the Mosel River. It is also to be traced in the departments of Coblentz and Ahrweiler.

Subdivision.

96. The subdivision into parcels is enormous, and is at the rate of 18 parcels to each property. There is no need to dwell upon the disadvantages of such an excessive subdivision. They have been already sufficiently noticed in respect of Wetzlar and Mülhausen. Where vineyards occur, the subdivision is not quite so prejudicial. It at least involves no destruction of crops, But it appears to involve the disadvantage that the grapes may differ enough to lessen the value of their mixture. This disadvantage also operates against small proprietors, several of whom must press their grapes together to make the wine. But, as the quantity and flavour of grapes are often the same over a whole district, the disadvantage does not always occur. The application of a consolidation law would be very difficult in respect of parcels of vineyards, for it would be almost impossible to estimate in terms of inferior soil the value of the best situated soil for vines, and so content the owner who might be forced to give up a patch in a good position. This difficulty is obviously greater in respect of vine-growing land than of ordinary tillage.

Agriculture.

97. As regards agriculture, it is to be remarked that no peasant seems to rely upon a patch of vineyard alone. He always, or with rare exceptions, has plough-land also. The two usually go together, because he requires manure for his vineyard, and, not being able to rely upon purchasing it, he must make it by hiring tillage and keeping cattle. It is interesting to find that the large pasturages in common have for the most part disappeared under the mere action of the increasing necessity for obtaining the greatest return from the soil. The cultivation of fruit is of importance, and the authorities are laudably promoting measures for improving this branch of the agriculture of the provincial district. *It is* hoped to obtain fruit-masters from Wurtemberg for each department to establish an experimental orchard, and to give instruction in the art of fruit cultivation. Several meadow-masters are already established. The travelling instructors in agriculture connected with the voluntary associations are also to be increased. The benefit of this institution is everywhere acknowledged. There are some interesting farms in the department of Coblentz, but it is not necessary to go into details of agriculture. It, however, comports with the object of this Report to note that the smaller peasants are here seldom found not to improve their cultivation by observing the results of innovation on the large farmers of the neighbourhood or district. But it is curious to note what a difference in this respect the favourable or unfavourable situation, as to climate, soil, and position, of the peasant makes in his readiness to improve his cultivation with or without observation. It would almost seem as if, after generations of toil upon the ungrateful soil, the peasant was hardened to disbelief in any kind of beneficial improvement in his lot.

Population.

98. The population is, on the whole, prosperous except in a few unfavourable districts, such as in the Hunsrucken department and in part of that of Neuwied. There is not any proletariat, although there is not rarely great poverty amongst the quite small proprietors, who must obtain auxiliary employment. Few proprietors have 100 acres. A peasant who has 30 acres is considered to be the owner of an estate. Peasants who have 16 to 30 acres with a horse and two oxen are considered wealthy. On a property of 3 to 5 acres an ox is used, and the quite small owner keeps a cow for every acre and a-half. The peasants divide and subdivide the land as long as ever they can amongst the family, and then sell it, when, in the absence of the counteracting influence of individual accumulation by economy, they can no longer subsist by it, or by it and an auxiliary employment. But there does not appear to be any increasing dispersion of small properties into minute portions. The peasantry, as a whole, seems to maintain its position.

Associations.

99. Both in the Provincial Department and that of Treves there are numerous associations apart from the Agricultural Loan Associations on the Raiffeisen principle. There appear to be whole villages or districts formed into such associations for procuring improved implements, machines, pure breeding cattle, and other articles of necessity for the cultivator. The opinion is universal that by such means of self-help the small proprietors can surmount the disadvantages of small properties and can farm as well as the large farmer. A slight extension of the principle, whenever steam-ploughing shall by its saving of labour and its deeper ploughing become a necessity, will enable the small

proprietor to obtain its advantages. As the lands of a whole village or district lie well together with scarcely an intervening occupied space, it would be quite possible and it would obviously be of advantage to plough the lands as one field, and thus save a large quantity of labour. I regret that I had not time to visit a village or district prospering from the benefits of such an association.

Raffeisen Loan Unions.

I gave myself, however, the pleasure of a visit to Neuwied, where I had an interesting interview with Herr Raffeisen, whose associations formed the subject of Division C of Part IV. I also met throughout the province with many opinions both in favour and in criticism of the Raffeisen Loan Associations. This criticism has been for the most part recorded in that division. The necessity of establishing associations differing from the Schultze-Delitsch unions is there shown, and the deviations both beneficial and prejudicial of the Raffeisen associations from such unions are noticed. The Loan Associations endeavour to meet requirements of the peasantry, which are not met by the associations mentioned in the previous paragraph. These are associations for purchasing by associated credit, and chiefly for hiring to the member the use of certain articles of agricultural necessity. Those are associations, also for enabling unpropertied peasants to become individual owners of certain articles of property which may conduce to their prosperity in life. These are mainly associations of persons who together subscribe the necessary capital. Those are associations mainly of persons who cannot thus subscribe ready capital, but by solidarity of credit endeavour to borrow ready capital for their banking purposes. The two kinds could be united in an association, or at any rate could always work in harmony. Each in its perfect form can confer inestimable benefits.

Herr Raffeisen related the many benefits conferred by the associations, and stated very clearly the deviations from the Schultze-Delitsch unions His charitable mind induced him to dwell upon the advantages of facilitating the entrance of the poorest peasant into the associations, and he recounted many an instance in which such members had been materially benefited. It seems also that the associations can act advantageously as distributive societies. If several peasants require each of them a small quantity of manure, for instance, the society can buy the aggregate quantity and send it to each peasant at less cost than each peasant would have separately procured it. The indivisible reserve fund is destined in the first instance to replace the borrowed capital, and Herr Raiffeisen is sanguine that this advantage will be eventually gained for the associations. In the meantime, and on the assumption that it is right to raise capital from non-members, it seems a pity that the attempt to obtain capital from the savings' banks failed. It would certainly seem possible to establish a beneficial connection between the two institutions. Possibly the apparently communistic principle of the accumulation of the profits for the common use in an indivisible reserve fund may be looked upon with suspicion by many. Then also the weakening of the solidarity of an association by the almost free admission of very poor members is not favourably regarded. And there may be other defects theoretically as well as practically. But the defects are only clouds that prevent the complete radiation of the blessing. When they are remedied, the institution will send its genial rays throughout the agricultural economy. But the simile halts here. The institution shines forth of as well for itself; the recipients are the emanating body. It is an interradiation amongst members and of their own activity, and not an extraradiation from a beneficent body not of their own creation.

Whatever the defects may, however, be, they can be easily remedied if necessary, and, indeed, must be remedied, in order that the institution itself may so prosper as to acquire in agriculture the important position which the Schlutze-Delitsch unions have acquired in industry. Such a result is to be hoped for, as bringing with with it large benefits for the small peasant proprietors, and consequently for the State as a whole. It is also to be desired, in order that such a man as Herr Raffeisen, who has developed the associations practically, and has devoted a life of benevolence to their prosperity, may see the greatest theoretical and practical perfection secured for his institution, and the greatest success obtained for his efforts.

(β.)—*Magdeburg.*

Area.

Population.

100. The area of this provincial district is about 209 square geographical miles, containing a population, in 1864, of 801,083 persons, of whom 485,000 lived in the country. Of these 303,000 were estimated as occupied mainly or auxiliarily in agriculture. The owners were about 43,000, nearly equally divided amongst the two categories, and the tenants were 500 and 1,400 respectively. As to soil, the provincial district contains $39\frac{1}{2}$ per cent. of favourable soils, but the Departments of Wernigeroda, Halberstadt,

Soils.

Magdeburg, Oschersleben, Aschersleben, and Wanzleben, comprising together an area of 46 square geographical miles, contain as much as 99 per cent., 95 per cent., 93 per cent., 91 per cent., 81 per cent., and 68 per cent. respectively of favourable soils. A large part of this per-centage is pure or almost pure mould. Next to that of Magdeburg the Department of Wanzleben gives the highest nett return for tillage; viz., of 22*s.* per acre.

Distribution of property.

101. The distribution of property in land was as follows :—

Of 400 acres and more	548
Of 200 to 400 acres	800
Of 20 to 200 acres	16,047
Of $3\frac{1}{2}$ to 20 acres	19,857
Of less than $3\frac{1}{2}$ acres	35,052
	72,304

This distribution is in striking contrast to that of the Provincial district of Coblentz, for the properties under 20 acres are little more than three times as numerous as those over 20 acres. There is also a larger proportion of properties over 200 acres and a much larger proportion of properties of $3\frac{1}{2}$ to 20 acres than in the Provincial District of Coblentz. The presence of larger properties is doubtless in a measure owing to the beet-root industry. The agricultural requirements of this industry are two; a certainty of having regularly a given quantity of beet-roots per annum, and the necessity imposed by the unskilful taxation of growing the most saccharine roots. Hence the beet-root sugar factories must have large estates under their own immediate control. When the taxation is altered the second requirement will disappear, and the first could be met by contracts. But the fact now is, that the industry has caused the accumulation by purchase of large landed estates.

Agriculture.

102. Agriculture varies little throughout the Provincial District, except in so far as the highest farming is in connection with the beet-root industry, and a backward farming is to be seen in a few districts where the peasant has not shown any readiness to adopt the improvements of deeper ploughing and heavier manuring. On the plea that he cannot afford so great an outlay on his acres, he sometimes lets his corn grow year after year in a stumpy fashion side by side with the tall strong crops of the beet-root farmer. On the other hand, the peasant with a medium farming seems frequently to produce more cheaply even beet-roots than the high beet-root farmer. As to the mode of cultivation, it is similar to that described for the Department of Cologne in paragraph 48, except that on many estates, it having been possible to purchase large quantities of lands, the farm buildings are of the best construction, and therefore the cattle in particular have a very comfortable time of it in their spacious sheds, but their litter is still long and not cut straw. Large quantities of artificial manure must necessarily be used. The saccharine qualities of beet-root depend upon the heavy manuring of the lands for previous crops, and under the present system of taxation the beet-root grower is unnaturally forced to grow the most saccharine beet-roots. In certain districts, where the soil is generally favourable, such as in the Wanzleben Department of 3 to 4 feet mould, then a deep loamy soil, and then the brown coal to carry off the water, pure agriculture cannot subsist, and beet-roots must be grown. This may help to account for the phenomena subsequently noticed of peasant proprietors living on the rents they obtain from the large beet-root sugar manufacturer. The peasants are, however, beginning to turn their attention to growing beets on a large scale instead of letting their land. Whenever they now grow them with their medium farming, the beet-root sugar manufacturer can generally purchase them at a cheaper rate than he can himself produce them. This probably arises in part from the fact that the latter farms, and is obliged to farm for a particular object, contrary to the sound rule of a due proportion of each class of crops, and consequently incurs a greater cost of production, and that the former is generally able to keep a larger proportion of cattle per acre, producing, therefore, a larger quantity of natural manure, and hence to grow the beets more cheaply. But commercial reasons may sometimes be mingled with this agricultural reason, for the manufacturer can afford to wait to buy and the peasant cannot afford to wait to sell. Oxen as well as horses are used for farm work. The former are considered to have an advantage over horses for drill and other machines, in consequence of the steadiness of their pace. Then, too, they are subsequently fattened for slaughter; but, until the hippophagists obtain greater sway, horses cannot be so utilized in the dead season of farm work. The parish roads are too bad to render it possible to use a steam plough. On large estates it would probably pay to put down a cheap wooden tramway to certain well-selected parts.

The manufacturing industry of beet-root sugar is predominant, and employs large numbers of work-people not in aid of agriculture, but apart from agriculture. These work-people may belong to proprietary peasant families, but the manufacturing occupation

can scarcely be said to be in aid of agriculture, except in so far as it provides employment in the winter months. On the contrary, there is an annual immigration from various parts, as from Mülhausen, in aid of agriculture, for labour is too scarce at certain times of the year.

Leases.

103. The leases are usually 12 years for peasant's lands, and two years before expiry the beet farmer tries to renew them. If he do not succeed the high farming ceases, but yet the lands are returned to the peasant in better condition usually than that in which they were taken over. This forms an exception to the usual experience of 12 years' leases, simply because it is to the beet farmer's interest to farm very high, and to continue to do so till within two years of the expiration of the lease, even though he materially increase the value of the land.

Peasant landlords.

104. There are whole villages living upon the rents received from such leases. The origin of this inverted order of things may have been that the beet manufacturer offered in the first instance as much rent as the peasant with his agricultural knowledge could then obtain in total income by his cultivation. Hence, as the peasant obtains the necessary knowledge and experience, he will probably refuse to lease his lands, and a return to a sounder state of things will be brought about in the district. This return would probably be accelerated by altering the system of taxation. The combined evils of the idle landlord and of the niggardly parishioner are too often reproduced in such peasant landlords. They retain frequently, it is true, a small proportion of their land, and the large peasant proprietor of 200 acres to 500 acres keeps in hand a small home farm. But they live in idleness and waste pitiably their time. Leisure, in which a great part of the wealth of nations lies, is lost in such cases to the common weal. The peasant landlord is not only above labour but also above trade. The large peasant with a landlord's income of 900*l.* to 1,000*l.* lives plainly, ignores education, despises intellectual activity, looks with contempt on other labour, and hoards his savings. The small peasant who lets his land is too proud to do any work except that of a proprietary farmer, and, having ceded for rent his opportunity of so working, lives idly upon that rent, instead of turning his attention and labour to some other object. Both, however, turn their attention to the object of making the local expenditure, especially for the schoolmaster, as niggardly small as possible. Living upon rent does not improve the peasant's political ideas. His vision is as much restricted as without rent, and in this respect other classes do not always take precedence of him. The over-government has not only injured the political life of the peasant, but also of other classes.

(*g.*)—*Supplementary Subdivision.*

105. A few remarks which could not be placed under any of the foregoing local headings have been reserved for this subdivision.

Savings' banks.

The savings' banks (within the last few weeks post-office savings' banks have been established) have wonderfully increased in usefulness during the last twenty years; and, if time and space had permitted, it would have been interesting to enter into some statistical and other details of their operation. Their usefulness in receiving deposits is not always restricted to the smaller money saver; their usefulness in lending is not always limited to loans on mortgage. Wherever I have met with the practice of such banks lending on personal security with two sureties, I have also met with assurances and proofs of its success.

Charitable institutions.

In due consideration of the scope of this Report it has been to my regret necessary to abstain from any inquiry into the numerous charitable institutions throughout the provinces I have visited, which exist not only for warding off pauperism, but also for ameliorating the condition of those human beings who may be visited with calamities incidental to the human race, but inscrutably reserved for those individuals upon whom they fall. But their frequency cannot fail to strike the inquiring traveller, and to warrant the assertion in paragraph 14 of Part I, that Prussia has a second place amongst nations for her charitable institutions.

Tenants.

106. With regard to rent they generally form a return of $2\frac{1}{2}$ per cent., and often of scarcely 1 per cent. upon the present value of land. For this reason alone the agricultural tenant would have a large advantage over the owner, but everyone strives to be the owner and to avoid tenancy. Whenever isolated cases of tenancy occurred, there seemed to be no appreciable difference in the farming of the tenant; moreover, it was the universal opinion that the proprietors did in a long series of years obtain greater returns for their labour than the tenant. The small tenant might ruin patch after patch of land, but in a series of years the small owner of a similar patch would have obtained greater returns. He would also generally do so year by year. The large tenant would not in the aggregate

fare better unless he had a very liberal landlord, who would readily make all necessary improvements and with certainty renew the lease.

Small and large proprietors.

107. In the comparison of small and large proprietors the result was the conviction that as a rule the small proprietor obtained a greater return for his outlay than the large proprietor. This was more especially recorded of the small farms of 10 acres to 50 acres compared with the large farms of 200 acres to 500 acres. The fact that the living expenses of the small proprietor are usually less relatively than those of the large proprietor, cannot be left out of consideration; but if five peasants with an aggregate of 200 acres spend together less than the large proprietor of 200 acres, the result is advantageous for the State. It is not fair to fix a different arbitrary standard for peasant and lord in such a comparison. As regards the cultivation the small proprietor, by his personal labour and superintendence, has a great advantage over the large proprietor, who must trust to bailiffs and farm servants. In arriving at the foregoing result of the comparison the reckoning of the wages for the labour of the small proprietor and his family has not been overlooked.

Overcrowding of houses.

108. Overcrowding of houses has not been specially mentioned; but in some places the overcrowding had all the features of overcrowding in England. It occurred chiefly in respect of labourers' families, whose members sometimes lived altogether in only one room.

With the exception of the concrete cases cited in the account of Wetzlar, it has not seemed necessary to cite in illustration of the position of the peasantry any other such cases. Inasmuch as they were cases amongst a peasantry struggling for life under hard conditions, it is easy to form an idea of what such cases would be in the better-favoured districts, and in the prospering villages.

Finally, it may be observed, that the following division will offer, in some respects, a remarkable contrast to, and in other respects a remarkable conformity with, the sketch in this division of a peasant proprietor, subject to equal division on inheritance of the land.

(B.)—*Land subject to Primogeniture and Borough English.*

109. As bearing upon the object of this Report in respect of peasant proprietors, there is scarcely any subject of greater interest than the history and present state of peasant properties, subject to the custom of primogeniture, and borough-english. And the Report would assuredly have been incomplete, after the many references in the course of it, to these interesting institutions in Westphalia, if I had not been able to add to these references a few personal and local inquiries, in illustration of such peasant properties.

For these inquiries in districts subject to the inheritance of undivided estates by youngest or eldest sons, I was led to select the departments of Herford and Hamm respectively. I also obtained some general information in Münster. I purpose to arrange the points of interest in a separate subdivision for each department, and in a supplementary subdivision.

(*a.*)—*The Department of Herford.*

110. This is a hilly department, near Minden, on the Weser side of the watershed between the Ems and Weser, and adjoining on the north-west the territories of Osnabruck. It is historically interesting, as containing Enger, the capital of Wittekind, who, as King of the Saxons, so long resisted Charlemagne. The district is proud also of being of the purest Saxon race.

(*a.*)—*Statistics.*

Area. Population.

111. The area of the department is about 7½ square geographical miles, and contained, in 1864, a population of 69,039 persons, of whom 58,000 lived in the country, and 11,000 in the town of Herford. The occupations of the people can be seen from the following figures:—

Occupations.

	Persons.
Agriculture occupied	12,020
Families and dependents	23,726
Hand-workers not engaged in agriculture	2,066
Servants ditto	730
Manufacture and commerce	4,500
Artizans and small trades	2,950

A large majority of the persons engaged in manufacture, commerce, and small trades, are also engaged in agriculture.

Emigration had decreased previously to 1865, probably from the influence of the war in the United States, but was reaching its usual number of about 100 persons. Births

averaged 2,600 in 1862-64; the illegitimate increasing from 1 in 21 in 1862, to 1 in 18 in 1863 and 1864.

112. The kinds of land are as follows:— Kinds of land.

	Acres.
Tillage	75,699
Garden land	2,397
Meadows	9,664
Pasturages	3,563
Wood land	14,551
Roads, &c.	4,617
Sites, yards, &c.	3,658
Water, waste land	165
	114,214

Since 1829 the plough and garden-land has increased by more than 10 per cent., and the meadow and pasturage have decreased by 20 per cent., and the forests by nearly 25 per cent.; that is, the arable land has increased at the expense of meadows, pasturage, and forests. The tillage is now 66 per cent. of the area.

The distribution of property in land was:— Distribution of property.

Of 400 acres and more	8
Of 200 to 400 acres	16
Of 20 to 200 acres	1,361
Of $3\frac{1}{2}$ to 20 acres	2,672
Of less than $3\frac{1}{2}$ acres	1,717
	5,774

The team-requiring peasant farms were, in 1816, 979; in 1859, 943; so that 36 had disappeared. In fact, 87 had been broken up, and 51 new ones had been established. There are 3,085 owners, and only 30 tenants occupied in agriculture.

113. The chief industry is cigar making, with 2,300 workpeople in 44 establishments. A flax spinning-mill, with 4,000 spindles, employs 200 workpeople. A sugar refinery employs 120 labourers. A few other industries besides the agricultural or local industries exist, but are of no importance. There is a house-weaving industry, to which belong 250 looms for silk and cotton tissues, and 500 for linen tissues, and 1,500 looms for linen as auxiliary occupation of the country people. Industry.

114. The cost of the public relief of the poor, is about 2,320*l.* annually, distributed to 1,600 recipients. Poor.

In respect of the criminal administration, only 8 cases in 1,000 inhabitants were tried, of these more than one-half were cases for fines. Crime.

(β.)—*The Division and Subdivision of Land.*

115. The most noticeable feature of the division of the land into property is the small number of proprietors at each end of the scale. Thus, there are only 24 properties over 200 acres and only 1,717 under $3\frac{1}{2}$ acres. It is also to be especially noticed that the properties of $3\frac{1}{2}$ to 20 acres are actually more numerous, in the proportion of 3 to 2, than the properties under $3\frac{1}{2}$ acres. In this respect the department differs from the provincial district of Minden, of which it forms a part, for the proportions are there 3 to 4. The properties below 20 acres are three times as numerous as those above 20 acres,—a proportion which contrasts strikingly with the proportion of 40 to 1 in Wetzlar and in Langensalza, This different division of property is no doubt owing to the custom of borough English amongst the peasants by the side of primogeniture amongst the gentlemen landowners. The great importance of the middle peasantry is also obvious, and is doubtless owing to the influence of the same custom and to the former inalienability of land. That importance as displayed here and throughout the greater part of Westphalia (excluding only parts of the Arnsberg provincial district), warrants the reference in this Report to Westphalia as the land of middle peasantry.

The subdivision of the land into small parcels is naturally restricted. Its chief manifestation is in the new settlement of peasant proprietors on inclosed common lands, who follow the custom of equal division of land on inheritance. Subdivision.

The fact of the disappearance of nearly 4 per cent.—the average for the Kingdom was only 5·11 per cent.—of the team-requiring farms since 1816 shows that as great a disappearance of such independent farms may occur in spite of the custom of borough-english, as may also occur in consequence of the French custom of equal division. Moreover, it is to be recollected that these undivided farms have only been subject for half a century to the influence of free alienability and divisibility, whereas such an influence Influence of borough-english.

has operated for centuries in Wetzlar, Langensalza, and Mulhausen. It will be very interesting at the end of another half century to compare the position of the distribution of property in this and the other districts named, that influence remaining the same.

(γ.)—*Its Agriculture.*

116. Agriculture is of preponderating importance, for 80 per cent. of the population is connected with it. Wheat, rye, oats, and flax are the chief crops. Barley is only grown for home wants, and rape and turnip seed only to a small extent by the larger farmers. Flax occupies on the average a ninth of the plough-land. Potatoes and some other roots are cultivated for domestic use. Cereals are certainly preponderating. The climate is unfavourable to orchards, but after allowing for this disadvantage, the cultivation of fruit is backward.

The department has 90 per cent. of favourable soils, 83 per cent. being loam on the higher land. It will be recollected that Langensalza had 98 per cent., of which only 55 per cent. was loam, so that the difference is not considerable. It may be doubted that the difference of climate is considerable. The difference of position is certainly not important. Hence, after making a due allowance for a small possible difference of climate unfavourable to Herford, the department of Langensalza is not ill-fitted for comparison.

The system of cropping is free, and follows the intelligence and resources of each farmer, or lags behind his unintelligence and resources. Its characteristic consists in the place assigned to flax in the rotation, and in the preponderance of cereals in consequence of the absence of good meadows. Even the large farmers, who are considered to farm rationally, take grain crop after grain crop, and manure every third or fourth year. Stall-feeding has been universal since the extinction of rights of common. Horses are chiefly used for farm work. On a property of 20 acres two horses are sometimes to be found.

Natural manure is chiefly relied upon, but guano and bone meal are not unknown. Black marl is everywhere used. Of the 25,000 acres of plough-land requiring drainage only 3,300 have been drained. The gross produce is—

	In Grain.	In Straw.
	Bushels.	Cwts.
For wheat	16	15
For rye	18	21
For oats	29	13½
For peas	11	18
For beans	18	18
For potatoes, about..	102	..

The number of horses was		4,071
„ cattle „		18,924
„ sheep „		9,519
„ pigs „		11,729
„ goats „		5,653

The exportation of lean horned cattle and of lean pigs has been remunerative. Of the former the breed is chiefly a home breed sometimes crossed with the East Friesland race. They cannot, it is thought, at present be fattened remuneratively for slaughter.

Defects of agriculture.

117. The foregoing details represent the agriculture of 1865, but there seems to be little alteration since that date. The defects of the system are easily seen. Indeed, the farmers of this department have, as a whole, the reputation involved in keeping fat horses and under-fed cattle. They also usually keep too many horses, but they are beginning to sell their horses and purchase cattle. They are also beginning to improve their system of cropping, but the department is still considered to be backward in agriculture. This is not owing to the smallness of the property, nor to the absence of capital, nor to the absence of free local institutions. In all these three respects they have an advantage over the peasant proprietors of Langensalza, and yet they do not show more intelligence than, or as much progress, as the farmers of the latter department.

Their progress in agriculture has been practically unhindered by division into small properties and by subdivision into minute parcels. In fact the majority of the quite small properties date from the extinction of commons. As a rule, therefore, every property was a self-supporting and independent farm passing undivided from generation to generation. All the real and alleged advantages for agricultural progress which such a system offers, have belonged to this department. Nevertheless, taken as a whole, the department is not only not in advance of, but even is behind, the department of Langensalza in agricultural

development. Moreover, the greater density of population was, and is an impelling force to agriculture in Herford. But in diminution of the unfavourable result of this comparison, it can with truth be alleged that these farms were not until this century absolute property, or subject to freedom of exchange, but were only in the relationship of tenancies with fixity and indivisibility of tenure and money or labour rent. Whatever progress in agriculture has taken place, has shown itself since the farms became absolute properties. It must not be omitted to notice that a consequence of the dense population has been the cultivation of every available spot of ground, and that this fact shows what an advantage, as in Mulhausen, the demand for agricultural produce gave to the farmer in possession of the soil.

With regard to means of communication Herford has also an advantage, inasmuch as the main railroad of North Germany has for more than a quarter of a century traversed the department, and during the same period some fifty miles of good roads have been constructed in various directions in the department.

(δ.)—*Its Industry.*

118. It will have been seen from the statistics in section *a* that the manufacture of cigars is the chief industry, which was then (1865) rapidly increasing in importance. This prosperity has continued to attend it, and has conferred many a benefit upon the dense population by furnishing labour in town for the surplus hands in the country. The linen industry of the neighbouring district, such as in Bielefeld, is also of advantage for the population of this department, and is the reason of the importance assigned in agriculture to the cultivation of flax. Formerly, linen-weaving and spinning employed thousands, and was the chief auxiliary employment of the agricultural population. It is to this fact, as in the case of Mulhausen, that the population owes its present disproportionate density. But in Mulhausen the more or less complete extinction of such an industry has had a more prejudicial reflex action upon agriculture than it had in Herford, and the reason lies in the totally different system of property and inheritance, which has always obtained in the latter. It would not be without interest to inquire in which department the dense population artificially created by a flourishing industry has, as a whole, the most suffered from its decline. The probability is that, from this point of view, Herford with its undivided landed properties has suffered more than Mulhausen with its divided properties, but all the necessary materials for such an investigation are not at hand, even if the conduct of it would suit the time of the writer and the bulk of his Report.

The English and Irish linens of machine production were the cause of the decline of both the weaving and spinning, but chiefly the spinning, of this hand industry; but the machine industry has already acquired importance in the neighbourhood, and is prospering. Labourers from Belfast are to be found in the mills, who are acknowledged to work better than the native labourers, and thus, by the greater value of their labour, more than cover the larger quantity of wages which they receive.

The population diminished considerably in 1853-58, by emigration both to North America and to the industrial centres of the province, in consequence of the misery which followed the decline of the hand industry.

(ε.)—*Its Population.*

Tenants.

119. It will have been observed from the statistics that the tenants do not form an important part of the community. But in the provincial district the tenants are rather more numerous than is usual in Prussia, for, out of 35,600 persons mainly or auxiliarily occupied in agriculture, 3,600 are tenants, and of the auxiliarily employed, the proportion of tenants to proprietors is 7 to 25. I had not time enough to visit the neighbouring department of Lübbecke where three-fourths of the persons auxiliarily occupied in agriculture are tenants, or the distant department of Paderborn, where the proprietors and tenants auxiliarily employed are about equal in number. On the other hand, the town of Minden has no tenants at all, probably because it has no communal property or property in mortmain. Herford department, however, has about 1,100 acres of communal property and another 1,100 acres in mortmain. This fact probably accounts for the 40 tenants, but I did not myself meet with any of them. Parenthetically it may be mentioned, in order to show how departments of the same provincial district often differ widely in their relations of property, that the department of Höxter, which is little more than half as large again as Herford, possesses nearly twenty-four times as much property, belonging to the communalties and settled estates and in mortmain. Yet Höxter has only 33 tenants, for the above property consists chiefly of forests. Settled estates, *i.e*, estates subject to feudal descent, or in *fidei commissa,* are comparatively numerous and extensive in the region

to which Höxter belongs. But I had no opportunity of examining the bearing of this fact upon the population.

Labourers.

220. But if there be no class of tenants in the department of Herford, there is a class of day labourers who are not owners of land. These have been already referred to in paragraph 86 of Part III. They are contract labourers, but, although they seldom change their masters, and remain from father to son on the same property, I did not meet with any instances of any of them being now labourers according to contract for 12 years. Usually such labourers are not in a position to save. Inasmuch as their wages consist so little of money, they have practically risen at nearly the same rate as the necessaries of life. But the former extreme density of population prevented the full rise. Now, however, that emigration and an increasing industry have caused the existing density to be less disproportionate, a scarcity of agricultural labour at present prices is beginning to be felt. The contract labourer must bring two, himself and another, into the field; the second may be a wife or a daughter. But he generally hires a girl when he has no daughter old enough, in order to leave his wife at home to attend to her domestic duties. Recently some contract labourers demanded to be paid in money. The peasant farmer offered them 1*s.* 5*d.* per day, instead of the present 8*d.* with house and partial board, and land and seed. The labourers considered this offer and then determined to abide by the old arrangements. Hence their wages can be fairly calculated at 10*s.* 6*d.* a week. Even, according to prevalent ideas, their houses are not always as good as they might be, and are sometimes with too little room for their families. But absolutely and not relatively considered the labourers' houses are sometimes very bad. The accommodation and overcrowding are, however, much worse in towns. This class of the population suffered much from the decline of the former industry, for the occupation of their families in such auxiliary work added to their comforts and enabled them to save, when they otherwise would not have been able. They have many of them emigrated, and it is the labourers and not the peasant proprietors who have chiefly emigrated. They all strive to become owners of land, but the opportunity to acquire land is very rare, and the possibility of saving is not frequent. There does not appear to be any class of paupers, though some of the labourers fall at times into great distress. This system of contract labourers appears likely to maintain itself and to become strengthened. Where the labourers have been long and perhaps for generations upon the land without contracts, contracts for a given time are being introduced. There is no labour to be obtained from the quite small peasants, who in other parts of the Kingdom form the large majority of the farm labourers as day labourers, for here such peasants seek the high wages of an industry, and they are too few to form a farm labouring class. There does not seem to be any material difference in character between these labourers and others elsewhere. They have much improved within the last 50 years. They are universally able to read and write, but they seldom care or are able to continue their instruction. They do not appear to be, on the whole, as intelligent as the quite small peasant proprietors of Saxony and the Rhine province. Their marriages are not on the average late, and their children are often obliged to leave the department to earn their bread.

Smaller proprietors.

121. Of the smaller peasant proprietors there is no need to say much. They, at least the so-called new peasants, have the custom of equal division of land on inheritance in contradistinction to the custom of borough-english of the other peasants. Sometimes, however, the equal division on inheritance takes place in respect of the deceased's estate, the valuation of the land being placed very low, so that one child remains with the greater part and takes up a mortgage to pay in money the value of the rest. They are more economical and thrifty than they were, and seem to be, on the whole, prospering.

Middle proprietors.

The middle peasants consist chiefly, though not most numerously, of the "Sattelmeier" and "Colonen." The former may be called large owners, for they frequently have from 300 to 500 acres; the latter have usually from 100 to 150 acres, and a few have more. But the lands of all are subject to the custom of borough-english. So strong has been, and is, the hold of the custom upon the peasant families that, until quite recently, no elder child ever demanded his legal obligatory share. A returned emigrant or two from America have recently done so. The children acquiesced in the succession of the youngest, even if no portions were left them, and never dreamt of claiming under the law of indefeasible inheritance. Even if the peasant die without making the usual will, the children acquiesce in the passing of the undivided inheritance to the youngest son. This is a striking proof of the force of custom in opposition to laws. It is noticed that the advance of education and intelligence is also making a change, and causing the spirit of demands for obligatory shares to arise. But, whatever the cause may be, it is becoming quite customary to leave portions for the elder children. The plan for regulating such portions is often based upon the land-tax assessment. The assessment of the nett return

Force of custom.

is usually one-third of the real nett returns.* The value of the land corresponding to the former is divided equally amongst the children, and the youngest son takes up a mortgage to pay off the portions. The custom of the succession of the youngest son is preferred to the eldest son, and is defended with much show and reality of reason, on the two principal grounds, that the parents can start the elder children in life, but may not live to start the youngest, and that the property remains longer in one hand when the succession is to the youngest son. The practice is almost universal to give over the property to the youngest son, as soon as he has attained his twenty-fifth year, when he is considered to be of age. The parents then retire into a room or a house of their own, receiving a fixed allowance, and the youngest son takes the whole management of the property. Formerly, excepting of course such children as succeeded in marrying heiresses to other farms or marrying otherwise well, the remaining children became farm-labourers, at home or settled in cottages, usually to the father and then to the youngest brother; and the more modern disposal of children by sending them into the towns for trade has not altogether replaced the older disposal of them. The children of such farm-labourers become too often paupers. Such a system kills all generous feeling, and causes the farm to be preferred to natural affection. An extreme instance of the effect of this system upon the owner of the property occurred during the late Danish war. The married cousin of a well-to-do proprietary farmer and her husband worked as day labourers. He was called out for service in the Duchies, and she was left to labour. The farmer-cousin ordered her to work for a half-day. Now, a half-day's work is paid less than a-half, for it only begins at 12 o'clock, after the dinner is over, so that those who work for half a day must dine at home. The farmer was, however, obliged, from lack of work, to discharge her two hours before sunset, and then refused to pay her until she had had an opportunity of labouring for those two hours. Among such peasants one might say that the horses were first, the farm next, and man last, unless the pigs preceded him.

Education.

As a rule, the middle peasants are not educated and do not care to educate their children. Some are, however, beginning to send their sons to the gymnasium, where they remain until they have passed the examinations necessary to reduce their period of military service to one year. One or two are intelligent enough to think of providing for their elder children, by sending them to study and fit themselves for professions and the more learned callings of life.

"Sattelmeier."

These remarks apply equally well to the dozen of large acred "Sattelmeier." They can trace their descent from the time of Wittekind. If Charlemagne had not, in the end, succeeded in imposing the Christian religion at the point of the sword on Wittekind, who long and stoutly fought as Saxon King in favour of his country and gods against the Frank invader, they would, probably, have been the nobles of the district. But, being conquered, they preserved their lands and became peasants. Now they are very peasants of very peasants, however wealthy they may be. It is not unusual for them to give 3,000*l.* in dowry to a daughter, but she goes to church in wooden shoes, and milks the cows next day. They are chief amongst the farmers who prefer fat horses and lean cattle, and who are the most difficult to cause to improve in agriculture. This is, however, beginning to change.

Marriage.

122. Marriage is of course a bargain, and is in addition a matter of caste. It is a bargain, and the peasant landowner lets it be well known that he will bestow a certain amount of dowry, and also that no suitor without a given amount of property will be allowed to come upon the farm to woo his daughter. The chief modern difference in the search of elder children for farms is that whereas they only hunted the heiress in the immediate neighbourhood, now the hunters beat up a much larger district. As it has been naively observed by such a proprietary farmer, "the boys must go further to get farms." The "Colon" peasants with their 100 acres respect caste in their marriages. If, as actually occurred, one of them marry a labourer's daughter in all respects his equal, except in that of belonging to a landowning family, he is cut off from all intercourse from the rest, and even for twenty years not one of his peers will cross his threshold. Moreover, the sons of "Colons" always try to serve in the cavalry, and leave the "infantry for the lower classes." Caste has not yet caused them or the "Sattelmeier" to be ambitious, that their sons should be so educated as only to serve one year. Indeed, it was till recently a disgrace not to be uneducated and not to serve the usual three years. In no district of the territories subject to equal division of land on inheritance is this feeling of caste so strong as in this district of borough-english. It will, however, be recollected, that in the provincial district of Magdeburg, a similar but weaker spirit of caste shows itself in the

* This is accordance with a law which allows the older law of equal division and the law of indefeasible inheritances to be thus evaded in favour of the customs of primogeniture and borough-english.

peasant landlords, in respect of their contempt for and aversion from any labour or employment other than that of a proprietary farmer.

and in firm hands.

123. The land is firmly held, and there are so few small portions to be obtained that the labourer has scarcely a chance of acquiring land, and the small peasant has very little opportunity of increasing his holding. On the other hand, if the holder of a middle property inherited for generations is unable to maintain himself, he appears to prefer selling the whole and emigrating to selling a part and freeing himself from his incumbrances. He is probably too proud to hold in his own country a much inferior position to his forefathers. Such a property is often divided into small portions and thus sells more advantageously. The portions are eagerly competed for and purchased even at prices which only correspond to 1 per cent. of rent. But the neighbouring middle proprietors often unite for the purpose of buying the whole estate and absorb their portions into their own estates. Recently this appears to be more frequently the case. But formerly the splitting up the estate into very small portions took place with or without the intervention of a so-called estate-slaughter.

rosperity.

124. The material prosperity of the middle peasants and of other peasants, solely or mainly engaged in agriculture, has been great during the last half century, whereas no such a prosperity can be said to have generally attended the agricultural population, for the decline of the former industries has not yet ceased to make itself felt amongst the labourers and the smaller peasants. Many circumstances combined to preserve the farmers from sharing in the general depression. Their produce obtained higher prices and several articles, such as butter and eggs, for which previously there was no external demand, became important articles of exportation from the department on the opening of the railroad. Their somewhat improved agriculture has also contributed. But special credit must be given to the great thrift and economy, and also the self-denial of many enjoyments, which have taken the place of qualities of character that resembled fifty years ago too nearly the worst qualities of English farmers of a former age. Moreover, the bestowal of absolute ownership and the commutation of real charges and services, and of many servitudes, have contributed much to this prosperity, for the endless causes of disputes and unceasing recourse to the lawyer which arose out of the former system have been entirely remedied, and the disadvantages of the unfree imperfect ownership of two partners with opposing interests have been replaced for him by the advantages of perfect freedom and absolute property. And last, but not least, the extinction of rights of common, especially of the commons of fallow and stubble grazing, must be cited as having powerfully aided in producing the more recent prosperity of the peasant farmers. This prosperity of this class is general, but naturally unequal throughout the department, the inequality being chiefly determined by the unalterable differences of the soil, position, and even climate of the district, and by the alterable differences of economy and intelligence. It is also in part determined by the size of the inherited property, the thrift and intelligence being equal, and by the absence of the prevailing luxury of keeping horses. The greatest change has been observed within the last twenty years since the opening out of the department by the roads and railroad, and the relief of the peasantry from commons. Before that time many communalties were very heavily in debt both corporately and individually. Now it is very different, as may be seen by the progress of the savings' banks and by their statistics. The peasant proprietors are saving much money. The Departmental Savings' Banks held in deposits nearly 150,000*l.* last year, of which about one-half belonged to the farming peasant proprietors.

easant pro-
rietors.

The peasant proprietors are a sturdy, independent, honest, and now thrifty race, not wanting in natural intelligence, but hitherto very defective in educated intelligence. They live very plainly whatever their means may be; and their houses are in good repair and furnished in a homely manner without luxury of any kind, and often with total absence of comfort. A "Colonat," *i.e.*, colony, or rather district of several Colons whose houses are placed near together, contains no dancing rooms, and the Colons, with Puritan sternness, consider such an amusement to be dangerous to the moral life, especially in country districts. They now look also with an unfriendly eye upon the inn, if one happen to arise in the district. They live to themselves and amongst themselves in small circles, and do not seem to be inclined to use the inn as a club. These differences of character from the Saxon character, as observed in Langensalga, can only be noted, but it would have been an interesting inquiry to ascertain how far they may be owing to each of several influences, such as the usually isolated position of the farms, the political and religious history of the department, the ethnological character of the people, and other distinctive differences from the population of the southern part of the Province of Saxony.

It has already been noticed that this population has the benefit of free local institutions for the communalty—a benefit which the eastern provinces do not yet possess, and

for which the departmental law now under discussion will prepare the way, as a reform of their existing communal institutions is urgently needed.

125. Lastly, it should be stated, that the peasant proprietors can in this department, and in the province, generally obtain money at 4 to 4½ per cent. easily, and that capital is so plentiful, that no Mortgage Debenture Associations are required. The savings' banks lend to a large amount on personal security, with two sureties, and only to a small amount on mortgage. Abundant capital.

The industrial class, which is little distinguishable from the agricultural population, shows, however, similar deviations from the agricultural peasant character as in Langensalza.

(ζ.)—*General Observations.*

126. The contrast between the relations of this department and that of Langensalza, is certainly striking; and a comparison of the two deparements will set out many of the advantages and disadvantages of the opposing Frank custom, and custom of borough-english in respect of inheritance. In this department are peasants who, for a long series of years, have enjoyed all the alleged advantages over the Langensalza peasant, of holding from generation to generation an undiminished property, and enjoyed all the advantages with him of possessing the absolute ownership of his land for the same period of time, be it for fifty or twenty years. Yet these advantages have not stimulated him to a better agriculture, or to a better education, or raised his family in the social scale. It is true that he may hold undiminished the land of his progenitors of half-a-dozen centuries ago, but this is in itself only a barren advantage. It may, indeed, be doubted whether a detailed comparison of half-a-dozen borough-english peasants and half-a-dozen Frank-custom peasants would result unfavourably for the latter. As to the custom of borough-english in maintaining middle properties, which must always be an object of interest to the State, the statistics of Herford do not show much trace of it, for the ratio of decrease in numbers of team-requiring farms, is more than half as much again as that of the Kingdom; but the ratio of gain of acreage is favourable, for it is 0·98 per cent. compared with the loss of acreage of 5·11 per cent. for the Kingdom. Contrast these figures with the corresponding figures for Langensalza of a ratio of increase in numbers equal to more than five times the ratio of decrease in the Kingdom, and ratio of a gain of acreage of 12·32, compared with the ratio of the loss of acreage of 5·11 per cent. for the Kingdom. It is rather astonishing that this should be the result in spite of the adverse influences of the Frank custom in Langensalza, and the favourable influence of the custom of borough-english in Herford. It is only fair to add, that the corresponding figures for the Provinces of Saxony and Westphalia respectively, do not show this unfavourable result for the latter. The loss in numbers is 5.32 per cent. and 2·25 per cent. respectively; and in acreage, 3·06 per cent. and 3·2 per cent. respectively. Contrast with Langensalza. Influence of borough-english.

It is interesting to record, that the "colons," who were formerly a species of perpetual tenants, and who on the whole did not suffer from the worst hindrances of the quasi-feudal system, have been able to get on, from the fact of the change itself, when previously they could not get on. This benefit of the legislation is not caused solely by the fact of their becoming proprietors, and thus profiting by the rise in the value of land, but also by the many advantages which the emergence from the former relations has given them in the absence of disputes of all kinds with the lords.

As middle properties, the farms of the districts which contain frequently from 100 to 150 acres, are too large for the general attention of the owner; and he is therefore liable to the losses caused on large farms by vicarious management. As a rule, the properties of 20 to 40 acres are considered the best. There is in the neighbouring department a district of a square geographical mile, with none but such peasants in it. But I was, to my regret, unable to visit it.

(*b.*)—*The Department of Hamm.*

127. It will not be necessary to do more than note the difference between this department and the previous one, and to mention any special characteristics.

This department lies along the Via Clara of the Romans, in the plain stretching northwards from the feet of the Haarstrang hills, which it touches, and is part of the best agricultural region of Westphalia. The customary descent of land is from father to eldest son amongst the longer established and larger peasant farmers, as it is amongst the gentlemen farmers. The team-requiring farms have increased 1·22 per cent. in numbers, but decreased 2 per cent. in acreage. As regards the distribution of property, it differs from Herford in having more than twice as many properties under 3½ acres, and above Distribution of property.

200 acres, respectively; whereas it has about the same number as Herford of properties of intermediate sizes. This difference probably arises from the greater proportion of new peasants who have the Frank custom of equal division of land on inheritance. It is, therefore, less suitable for studying the influence of the descent of undivided farms, than the department of the foregoing subdivision. Moreover, it is superior to Herford in climate and position, but is inferior in favourable soils, by the considerable difference of only 57 per cent. of loam and clayey-loam soils against 90 per cent. The agriculture is much better than in Herford, and grass land forms an important feature of it; and the nearer position to the great manufacturing centre, and the existence within it of a considerable manufacture, are great advantages over Herford. Here the farmer has benefited more than in Herford from being the owner of the land, and from consequently receiving the increased returns, known as theoretical rent, which such advantages yield. The primogeniture peasants are more alive to the value of education, than the borough English peasants yet are. They send their sons to the gymnasium, and consider it a disgrace for a son not to be entitled to serve only one year as a soldier. With regard to inheritance, the object of the existing owner is always to preserve undiminished the family property, and to avoid charging it with such high sums for the other children as should render it difficult for the eldest son to preserve the property intact. The large peasant proprietors (from 300 to 400 acres), usually give a portion to each younger child, of a thirtieth to a twentieth share of the inheritance. Hence, ten children would receive from a third to a half of the value of the property; and the eldest son would even then have a preponderating share. The children either marry heiresses of farms, or become manufacturers and merchants, or remain at home on short allowances. These farmers are prospering much, and new houses of much comfort and farm-buildings of modern construction are everywhere visible. The labourers seem to be in comfortable circumstances, and their houses are comparatively good. The large farmers are considerate enough to order the labourers' wives to work only half, or third days, so that they have time for their household duties. The labourers cannot save much,; for the case of a man and his wife having saved 80*l.* in eight years of farm service was mentioned as exemplary, and not usual.

riculture.

asants.

heritance.

bourers.

128. The department of Hamm belongs to the Provincial District of Arnsberg, to which Siegen also belongs; and as has been previously remarked this district contains the greatest contrast of favourable and unfavourable land. The Provincial District of Münster resembles much the department of Hamm in its general relations, but differs from Hamm in being almost purely agricultural. It is within this district that the heath-manuring, as mentioned in paragraph 43 of part III, is practised. This practice is now prejudicial, and there are farmers who would be grateful to any one who would cart away a foot deep of soil from their farms. It is also perverse, for the farmers cart the heath sods up hill to their farms, whereas they ought to cart marl down hill to them from the high ground which contains it. But the curious feature of this heath-sod-manuring is its history. When the forests were cut down, the vigorous life of the underwood was noticed. Sods were cut from the soil and ploughed into the farmers' land with excellent effect, for with the little sand of the under soil was much mould clinging to the roots. But in the course of time the mould was used up and no fertilizing substance was conveyed to the farmers' land. Yet the custom continued with effects which may be imagined, and it still subsists.

eath-sod anuring.

(*c.*)—*Supplementary Subdivision.*

129. In Westphalia the savings' banks lend a large part of their funds on personal security. In Münster at any rate not a groschen has been lost by the system, and the town can show some useful institutions built by the profits of the savings' banks. The peasant proprietors make a large use of them, as may be seen from the statistics. Even the larger peasant proprietors use them frequently. There is no lack of money in the provinces, and any one can get what he requires at 4 per cent. or even less. In course of time this abundance of capital will be distributed over the Kingdom, but at present the Berlin and other Banking and Mortgage Associations can do no business in Westphalia in loans.*

avings' banks.

130. Rents seem to vary from 2 per cent. to 3 per cent. on the value of the land. This value has in some districts increased enormously. This is an example from near Unna in the department of Hamm. A certain area of land was let forty-five years ago at 1*s.* 6*d.* per acre. On the lease terminating it was offered to the tenant for purchase at 54*s.* per acre, but the tenant refused the offer. The land was then cut up into small properties and let for twenty-five years at 4*s.* 6*d.* per acre. It was a little later redeemed

ents.

* It is interesting and curious to note that in Westphalia the monetary conditions are reversed. The farmers lend capital to industry, whereas usually the manufacturers lend capital to agriculture.

at eighteen years' purchase, and is now worth 45*l.* per acre. Two illustrative inferences can by the way be drawn from this case. It is an illustration of the extinction of even twenty-five years leases by the Legislation. It is also an illustration of the enormous advantage which has sometimes accrued to the peasant proprietor apart from his own industry and solely from the accident of the position of the land. It is possibly better that he should have obtained it than that the former lord should have had it, but why should either of them have received a benefit created by the community and not by himself? The land is held firmly, and the middle peasants usually buy whatever comes into the market.

Tenants.

131. There was no opportunity in this province to compare tenants and proprietors, but the opinions held, in respect of the advantages of absolute ownership over tenancy even with long leases, were identical with those already recorded in this report. As one gentleman farmer of great intelligence and practical acquaintance with the former and present agricultural economy of Prussia remarked, "a lease of twenty-four years will do, but not a lease of twelve years; it often takes a large or even middle proprietor twenty years to find out all the peculiarities in soil of his property."

Small and large proprietors.

Neither was there any opportunity of comparing the small and large proprietors, but from what I could gather, the remarks in previous parts of this report in respect of the relatively larger returns from small properties and of the general aptitude to adopt agricultural improvements will apply also to the large and small properties of Westphalia.

Policy of yeomanry.

132. State policy requires the land-owning population as a counterpoise to the manufacturing population, for it is essential that in political questions the cultivators of the soil should be owners. Not only, therefore, is it held that the fact of property widely distributed produces praiseworthy moral qualities and promotes individual prosperity amongst a numerous class of the population, but should be an object of State policy now not as a counterpoise to the privileged classes of nobles and others, but to the restless unpropertied classes of artizans and manufacturing labourers. The strength of the nation lies in the team-requiring farms. These farms must also be watched with attention for the military reason of keeping every part of the Kingdom supplied with horses. The proprietary peasantry is here as elsewhere the best source for soldiers. The returned soldiers also confer much local benefit by the higher standard of educated life which they usually offer by their example to their neighbours. This is apparently everywhere true of the three-years' soldier. But of the twelve-years' soldier it is not so true, for he returns to a situation on the railway or elsewhere under the State a mere machine incapable of self-willed action.

Emigration.

In respect of pauperism and emigration there is little to be said. Pauperism, as a permanency, seems to exist as little in agricultural Westphalia as elsewhere. Bnt some of the labourers are very poor, and not a few of them emigrate. There are, however, monied emigrants. These, probably, come chiefly from the owners of undivided family farms. who prefer emigration to an inferior social position at home, when distress has overtaken the family.

Minimum independent property.

The minimum size of property required to maintain a peasant family does not vary from those already recorded for other provinces. On good soils five or six acres will suffice, and even four acres has been mentioned, but on less favourable soils even fifteen acres may be required.

Benefits of legislation.

133. The examples of the benefits which have been conferred by the agrarian legislation are as striking and evident in this province as elsewhere. The extinction of commons has done almost more than anything else to promote the agricultural development of all parts. There are instances of an increase of three to five times in the production of a district since the commutation. It will not be uninterestiug before closing this subdivision to refer to the plan of a model labourer's house. It is a quadruple edifice, each corner being a house. It is one-storied, with a garret above and a cellar below; the entrance door is raised half-a-dozen steps from the ground. It has two entrance-doors and two windows at each end, and six windows at each side. Thus each house has an entrance-door and a window at one end, and three windows at one side. It contains a vestibule with a kitchen on the inner side from the corner, and then a living-room and two bed-rooms extending along the side. The rooms are white-washed, the flooring is deal, and the windows open. The living-room is not small, and looks pleasant. A quadruple edifice cannot, however, have any thorough ventilation, and is a double arrangement of the back-to-back houses of Leeds, which are condemned as unhealthy.

Labourer's house.

Travelling through Westphalia is much more like travelling through England than any other part of Prussia which I visited. I do not refer to the fat horses and neglected manure, but to the prospect of the land. Here there are woods and copses and clumps of trees, and also hedges and ditches as wasteful as any in England. Here too, pasture-land

is to be seen in similar proportions as in England. In the other provinces "the ground indeed is tawny," but here "it is with an eye of green in it" But the similarity to England is not alone in the prospect of the land. This province, in its agricultural relations, especially in the prevalence of middle and large properties is not altogether dissimilar from England in her agricultural relations and prevalence of large properties. Neither is the dissimilarity of some Westphalian districts from England in respect of undivided property and social influence markedly great.

(C.)—*General Observations on the Results of Local Inquiries.*

134. I regret that time has not allowed me to do more than select and arrange with running pen the notes of my journey, according to the localities visited, under a couple of distinctive headings. I should have preferred to take the chief subjects treated in this Report, and to arrange, in illustration of each, the results of inquiries in respect of it at each place. I shall adopt, in a rough form, this plan for the following observations.

Prussia in 1800.

I hope, that not the least amongst the results of the local inquiries will be, that a better idea can now be formed by the reader of what the condition of Prussia was in 1800. The disadvantages of subdivision of property into intersected portions, as displayed in Wetzlar and Mülhausen,—the disadvantages of the three-field cultivation with field-compulsion, as displayed in Wetzlar, and the disadvantages of rights of common to be inferred from the advantages of their extinction, as displayed in Langensalza and Herford will, together with a simultaneous consideration of the agricultural, industrial, social, and political conditions of Prussia, as referred to in the course of this Report, enable one to picture the deplorable state of Prussia before the Stein-Hardenberg Legislation commenced.

Prussia now.

On the other hand, the sketch of Langensalza, Herford, and Hamm will assist one materially to form a correct idea of the present state of Prussia after the operation of the Stein-Hardenberg Legislation, especially if the direct results of that legislation, as stated in this Report, be recalled to mind.

Principle of absolute property.

135. As to the principle of absolute property for numerous owners which underlay that legislation, it must be acknowledged, after the many proofs of its fruitfulness in such different places and testimonies to its fruitfulness from such different persons, which have been added to those already recorded in previous parts of the investigation, that the adoption of that principle has been justified by its success as well as by its wisdom and policy. The moral benefits, and the material prosperity which it has conferred upon the peasantry, are to be distinguished from those benefits and that prosperity, which have arisen from other causes and unite to make the sum of blessing to the peasant. That prosperity has been forwarded by the principle of absolute property, so far as it is owing to the fact that the peasants now receive the increments of theoretical rent* which arise from the general prosperity and advancement of the nation, either locally or as a whole, and as it is owing to the fact that the investiture of absolute property has freed them from all restrictions of personal activity and from all fears of insecure occupancy and of disproportionate rent. That principle has distributed amongst a large number of peasant cultivators the profits from the increased value of the land, which, for the most part, would otherwise have accrued to a few lords. The peasant has certainly gained; and, if a wide distribution of property and of the value of such increments be a good thing, the State too has gained. The State has, however, gained most by the freedom of personal activity which the peasant now enjoys. The peasant too by that freedom is enabled to labour better, and to obtain greater returns for his labour, irrespective of the advantages which accrue to him apart from his own exertions. The principle of absolute property brought with it the necessary advantages of a commutation of rights of common and of a consolidation of intersected lands, by which the peasant has enormously profited. Prussia, in dealing with her former agricultural organization, cut the Gordian knot but left an inner knot still tied. She decided that the peasant should not only have full usufruct, but that that usufruct should be converted into absolute property. In order to shield the peasant cultivator from danger to his livelihood, from insecurity of occupancy, and possibility of extortionate rent, she invested him with absolute property, and thus decided that to him, and not to the large landowners or lords should belong the future independent increase in the value of the land. Prussia used justly the principle of expropriation, and gave the influence of her decision to the allegation that such an increase of value is better distributed amongst a large number than amongst a small number. Possibly the large number use it more reproductively than the small number could have done. But Prussia did not untie the inner knot, and it yet remains for a statesman to untie, who shall decide

* When I wrote this last part of the Report I had not seen Professor Cairnes' essay in the "Fortnightly Review;" or else I should have used "economic rent" instead of "theoretical rent."

between the merits of the three systems—of tenants and private landlords, of proprietary cultivators, and of usufructuaries under the State as landlord in respect of the theoretical rent.

136. As regards the advantage of proprietary farmers over tenant farmers under private landlords subject to private competition, it seems to me clear that the universal concurrence of opinion in Prussia is of great weight against the system of tenants, even with long agricultural leases. The lease should be twenty-four years, and then the State might again, as she has once done, commute long leaseholds into absolute property. It is possible that the large landowners will, in course of time, let their lands instead of farming them. But it is not all likely that the peasantry as a whole, will lose their lands and be converted into another kind of tenants.* If this did occur to any large extent, the spirit of the National Agriculture Legislation is such, and the opinions of men practised in the working of the former and present agricultural organizations are such, that it would not be astonishing to see the legislation reapplied. Wherever there are leases in Prussia, the legal maxim, *Quicquid plantatur solo, solo cedit,* acts as injuriously in Prussia as it does in England, as witness the possibility of iron sheds being erected on leased lands as recorded in paragraph 48. Moreover, improvements are often prevented by want of security on the part of the tenant cultivator, and want of interest on the part of the landowner. The tenant cultivator has the interest but not the security. In Prussia the security of the tenant is lessened by the law which allows the succession of a life tenant to determine the leases in a year. In England the interest of the tenant is still further diminished by strict settlements. This limitation on the powers of dealing with land is less prejudicial in Prussia because of the facts that only 15 per cent. of the land is here settled, or in mortmain, whereas in England 70 per cent. is said to be so settled, and that the costs of improvement are in Prussia necessarily charges at law on the settled estates. It is worthy of record in favour of proprietors as compared with tenants that agricultural tenants are found, with few exceptions, only on more or less inalienable lands in Prussia. It would almost seem as if tenancy could not exist in any strength where the exchange of land is freest. A large tenancy may be better than a small tenancy. But the risk of vicarious farming causes few but thoroughly instructed capitalist farmers to enter into a lease of large properties. The tenant farmers who have chiefly succeeded are the Crown tenants. But they had, till recently, very cheap leases, and they have, as a rule, a good improving landlord in the State. The leases concede free farming with scarcely an exception. The covenant not to sell straw without permission is an exception in respect of Crown leases. The system of tenancy is based upon the assumption that the landlord will never be opposed to the national progress or to the improvement of his land, and upon the assumption that the tenant will not be guided in his cultivation by the temporary interest which he has, but by a permanent interest which he has not; but these are mistaken assumptions as regards Prussia. The general opinion as to the usual superiority in respect of the nett returns and of the carefulness of the cultivators of small over large properties is confirmed by the results of the local inquiries.†

Proprietary farmers *v.* tenant farmers.

137. As to the Frank custom of equal division of land on inheritance and usually of the natural division of each portion of land, it is clear that the tendency of the former part is to promote a wide distribution of property, and that the inevitable result of the latter part is a prejudicial amount of minute subdivisions. But it does not appear from the relations of the localities examined that the unavoidable result of the custom is a warren of of paupers, or that the division of property has no limit. The subdivision must necessarily be much greater than the division, for the latter is constantly remedied by accumulation, but the former, until recently, was never remedied. It is always necessary to carefully draw the distinction between the division of land into property and subdivision of land into parcels in dealing with the question of peasant proprietors. After allowing for all the favourable counteracting influences and the unfavourable helping influences, it must be conceded that the alleged pernicious results of the Frank custom are not as evident or as prejudicial as one expected to find. Neither does it appear that the free exchange of land and this custom together have succeeded in destroying in an alarming proportion the middle properties, or, considering the increase of population in adding to the acreage of quite small properties and to the number of quite small proprietors. On the other hand, the Frank custom seems to have produced such qualities of character as have largely contributed to counteract its

Frank custom.

* There are, however, here and there traces of the working of the commercial principle and of other economic causes, but they cannot now be followed up. That of the commercial principle is mainly to be traced in a growing opinion that tenant farming is better than bailiff farming.

† Two frequent statements of German writers on agricultural economy deserve record. "Higher farming will diminish the size of farms." This is contrary to the English idea, but it is probably true. The other is "larger gross returns for small properties, but larger nett returns for large properties." Rau's famous table of comparison illustrated this; but many objections have been taken to it.

dispersive action. Moreover, it would seem that, both in the present generation and in a series of generations, the children of a Frank custom peasant come off better than the children of a borough-english or primogeniture peasant.

Custom of singular succession.

138. As to the custom of singular succession either in the form of borough-english or primogeniture, it does not appear to have been more successful than the Frank custom of plural and equal succession in preserving the team-requiring farms or in raising the social and intellectual standing of the families which enjoy its advantages.

A riculture.

139. It is not necessary, considering the imperfection of the local inquiries in consequence of the season of the year, to observe upon their results, excepting that, although agriculture has much advanced especially in some districts, it is in many districts more or less backward. Grass land is giving place to plough land, and stall-feeding is almost universal. There is much activity on the part of Associations and also persons in authority to reform and improve the methods of cultivation. The deficiency of horned cattle is being remedied in many places. There is not always a deficiency of floating capital, but a deficiency of perception of its need. The safe rule of bringing one's business within the compass of one's capital is too often disregarded by the proprietary cultivators of Prussia. Many would have a better income if they converted some of their land into floating capital. The carrying on of distilleries and beet-root sugar factories in connection with agriculture is a characteristic of the Prussian agriculture, for usually such establishments would be separately worked in towns. The immense value which a beet-root sugar industry gives to the land makes one wish to see it established in England or Ireland. Liebig, or a disciple of Liebig, once playfully said, "If a man wish to ruin his neighbour let him pursuade him to grow beets." But the success of beet-root farming in a series of years on the same soil shows that the ruin can be averted; and, knowing this, an Englishman can recommend the cultivation to Ireland. But the difficulties of its adoption are so many that it is not probable that it will, at any rate for some time, be introduced into either England or Ireland. There is little really high farming, except in connection with beet-root farming. The medium farming seems to be usually more remunerative than high farming.

Industry.

140. The influence of industry need not be more specially deduced from the statements already made. The frequent blending of the industrial and agricultural classes is considered a blessing to the district. The ease or difficulty with which small portions of land can be leased or acquired by the artizan is a subject of importance. But where a former hand and house industry has declined, the result is painfully visible. Spinning is still an important house industry, and weaving is practised in many districts. But it is the women who spin and the men who weave. Frequently the men weave only and the wife and family till the little property. This distribution, and to us reversed distribution of parts as regards indoor and outdoor employments, recalls that of the ancient Egyptian life, for, as Sophocles* writes, "There the men sit at home weaving, and the wives labour in the fields for the necessaries of life."

Peasant proprietors.

141. The peasant proprietors of Prussia possess the qualities which on all sides are acknowledged to be common to that class, viz., thrift, diligence, forecast, economy, and the like. But peasant proprietors are also called unintelligent, ignorant, and even brutalized, as if these unpraiseworthy qualities were the natural results of peasant proprietorship. One of two things, either judge the peasant proprietor by a standard equally applicable to all, or compare him with the corresponding class in another country with about the same advantages and opportunities as himself. If, then, he be found to be relatively or comparatively unintelligent, ignorant, and even brutalized, let the verdict be entered against him. But, so far as I have been able to see the Prussian peasant proprietor at home, I cannot think that the verdict would go against him. Compare, for instance, the Prussian peasant proprietor whose income is the same (prices being considered) as that of the English agricultural labourer. As class against class he will not come out of the comparison with disadvantage. Neither will the higher class of peasantry. It is sometimes said that productive land, a swarm of proprietors, and a brutalized or ignorant peasantry go together. They may; but even then, are they brutalized because the land is productive, or because they swarm as proprietors, or both? Or are they brutalized from very different causes? If so, it is no reproach to the productiveness of the land or the multitude of proprietors. One might as well say productive land, a few landlords, and brutalized agricultural labourers go together. But every one knows that productive land does not engender, and the paucity of landowners does not create brutalized agricultural labourers. I have not yet visited a district of peasant proprietors which satisfied the above three conditions, and I cannot attempt to

* My small and unhappily diminished classical knowledge did not enable me at the time I wrote this part of the Report to find this quotation, or to recall with accuracy the original. Hence its appearance in plain English garment.

discover why they are brutalized. But as regards the Prussian peasants they are often servile, because they have only emerged half a century from serfdom and forced service, and have had no freedom of action or thought under their former minutely paternal Government, and have not yet discovered that they are out of tutelage; usually defective in instructed intelligence, because they are nninstructed except in the elements of primary knowledge; sometimes too foolishly proud to labour or trade, and generally incapable of self-willed action. The servility will soon pass away. The instructed intelligence will probably come with instruction in about the same proportion as to other bucolic minds, judging by examples which have occurred. The foolish pride will be less easily cured, but the education of the military service and the increasing dignity of labour tend to cure it. The incapability of self-willed action is another result of over-government which is gradually passing away. The tendency to unbroken idleness shown by the landlord peasants of Magdeburg is exceptional; but there is much waste of time by many peasants. The tendency to niggardliness, especially towards the schoolmaster, of the same peasants and of other peasants, is not a result of peasant proprietorship any more than the other unfavourable points of character. It can be observed in all its glory in the corresponding classes of agricultural labourers and tenant farmers in England. The peasantry contains, it is true, a large number of ignorant persons. It is also true that—

> "———ignorance is the curse of God,
> Knowledge the wing wherewith we fly to Heaven."

But it is still more true that, unless a man have opportunities to get rid of ignorance and to acquire knowledge, it is not surprising that, whether peasant proprietor or peasant labourer, he should abide in ignorance. Before the reproach of ignorance can be addressed to peasant proprietors because they are proprietors and not tenants or labourers, it must be shown that each class has had its opportunities, and that the proprietors have not availed themselves of the opportunities, whereas the tenants and labourers have so availed themselves.

The happy medium of land for a peasant proprietor is that which shall keep himself and family regularly employed throughout the year. As soon as he understands the true value of leisure and prefers not to waste time unoccupied on the farm, he will not require constant employment on his land to prevent the evil of a useless leisure. When, too, he understands better how to think for himself instead of allowing others to think for him, as he is now apt to do in consequence of the effect upon him of the Government always thinking for him, he will cast off all those indications of requiring tutelage, which render many timid of the result of his freedom. In the meantime he has the good quality of being a law-observing subject of the Realm. If the peasants need no longer to protest by their acts, "Omnes legum servi sumus, ut liberi esse possimus," they still give this proof that they will be able to use their freedom without abusing it.

Labourers.

142. I did not find any class of labourers resembling those, of whom paragraph 89 of Part III speaks, as forming one end of the agricultural social scale. But the labourers are sometimes wretchedly placed; although, on the one hand, they do not furnish any class of permanent paupers; and, on the other hand, they seem to be, on the whole, in as good a position as, if not a much better position than, the English agricultural labourer.

It may be said that in the Western Provinces and Saxony one only sees the sunny side of peasant life. This is probably true. Mr. White's Report will, no doubt, give glimpses of the less sunny side of peasant life.

Race and religion.

143. It may have been observed that I have not touched upon the influences of race or religion. Such influences can be better studied in the Eastern Provinces, where races and religion mingle.

A last note is that there are evils which affect the cultivators in an indirect manner by affecting more directly other classes. The one is the mistrust which the former unfortunate blending of justice and politics caused. It is so much easier to do a mischief than to undo it. The other is the evil of over-centralization. Its pernicious influence is felt in many directions. It certainly injures the position of the local authorities, and has taken away the charm from that useful institution—the county counsellor.

Centralization.

In this brief account of the results of my journey, I have avoided a multiplicity of references to the other parts of the Report, and a repetition of facts stated elsewhere. It is assumed that the reader will have arrived at this account of the local inquiries with a knowledge* of the facts and opinions marshalled in the preceding pages of this investigation. Neither have I pointed out the confirmations obtained in each place of many statements already recorded. But it seems to me that the results of the inquiry into the

* In judging, for instance, of the agricultural development of a locality visited, it will be necessary also to bear in mind the physical conditions and agricultural relations of the province as described in Part III.

Local inquiries have confirmed previous statements.

local opinions of men of all classes with the accompanying and local facts unmistakeably confirm in all essential points the conclusions set forth in the preceeding Parts of the Report, as well as illustrate and render more real the facts of the former and the present agricultural economy of Prussia.

Review of the whole Subject.

He who climbs an Alp, halts half-way to obtain a general view of the varied country through which he has passed in order to reach that stage in his ascent. He *halts not* to stay, but only to climb higher. The writer of this Report halts in his investigation of Prussian agricultural economy, conscious that he has only reached half-way, and that he has not yet reached the towering summit from which all the features of the country can be surveyed in their true importance. But, unlike the climber of the Alps, he halts to stay, and not to climb higher. He can, however, mark with an equal regret, that in the course of his journey through the unknown land, here an interesting feature has been unseen or meagrely sketched, and there a less interesting feature has received undue prominence.

Early settlement.

Imagination can picture in remoter human time the disappearance of the aborigines of Germany before the migrations from the East, and in later time the appearance (after a long series of wanderings and interminglings of the new races) of the tribes, of which Roman ears heard and which Roman eyes may have seen in Roman Germania. Vision can dimly penetrate to the periods of transition from nomadic to pastoral life, and from pastoral life to the beginnings of German civilized life with its primitive tillage, and its peculiar customary descent of land. But vision can discern more clearly the outlines of the earlier aggregation of Teutonic life into land communities, of which the distinctive principle was association with property in common, and which have, by their resulting diversity of estates and commons, fashioned many a feature in the historical and contemporaneous prospect of Teutonic land. In the time of Charlemagne, one obtains glimpses of the establishment of the military marches for protecting the frontiers of the Holy Roman Empire. But already, before his reign, arises the little cloud, which eventually overshadows Germany with the darkness of the feudal system. Under King Otho I, although the nobles are still disinclined to enrich themselves with lands on feudal conditions, the system is already the foundation of the State subsisting little by law but chiefly by traditional custom. Until it arises on the doubtless congenial soil of Italy, its incidents are not set out in legal form, but the unwritten and written feudal law of Lombardy* is subsequently reflected in the feudal law of Germany. The feudal system soon extends throughout all classes. The vassal imitates the Sovereign, and the nobles imitate the vassals; neither are the ecclesiastical dignitaries slow to follow; so that gradually feudal tenures of various kinds usurp, with few exceptions, the former rights of peasant and noble to the absolute as well as the usufructuary ownership of land. This distinction between absolute and usufructuary possession is an idea of double ownership, which was introduced by the civil jurists to give legal precision to the rough conceptions of Teutonic custom. It is the peasant who suffers the most from the obliteration of old Teutonic customary law and the inscription of juristical feudal law. The vassal or noble endeavours to compensate himself for his comparatively small loss of freedom of property, by forcing gently or roughly the peasant to "commend" himself and his lands to the vassal or to the noble as lord. Thus, the previously free peasant becomes a tenant for rent in the shape either of military services, or agricultural services, or of money, or of divers combinations of two or all of these, which services may vary from trifling burdens to forced labour and serfdom. It is, therefore, no wonder that there are bloody spots in the landscape, for the peasants remembered well their real rights and the "Sachsenspiegel" carefully reflected them. It is rather a wonder that they regained so little, before this century began.

Land communities.

Military marches.

Feudal system.

In connection with the feudal tenures and the military marches arise various Courts of jurisdiction, of which, despite the national agriculture legislation, one can still see vestiges of unnecessary protuberance within Prussian territory.

* The word "feudal" now takes a place in history, but one is obliged to use it for the earlier development of the system, although it little corresponds to the Teutonic idea as contained in the German word "Lehen." I am no philologist, but the usual derivation of feud seems to me rather improbable. In the first place, does not the history of the word and its derivatives show that it only appears about the time of the rise of the system in Italy, and its propagation in juristical garment in Germany? In the next place, if "feudum" be derived from old High German and Saxon, where is the corresponding word in the languages of the Teutonic peoples, and why is "Lehen" the vulgar German word? Lastly, the conception involved in the usual etymology is inaccurate, for the feud is an estate in trust for future services and not in reward of past services. Consequently, it would seem to be more nearly connected with the Latin "Fides" than derived from the old High German "Feh" reward, and the Saxon "Ohd" possession. If "feudum" do occur in documents before the twelfth century it may have come through the old Norman "Fidz," *anglicè*, fees.

The feudal tenures resemble in many respects, but differ in some not unimportant incidents, from the feudal tenures of England. Most of the base tenures can, however, be designated as in the main the older villein tenures, and the later tenures by copy; but there is no complete identity. Moreover, in North Germany it was generally the lord who, by force of law, encroached upon the peasant's rights, and not the tenants, who, by force of custom, encroached upon the lord's rights.* Feudal tenures.

One descries three kinds of colonization within the area of North Germany; the colonization in villages with feudal tenures, of the Eastern lands, into which the Othos had previously carried fire and sword with unparalleled devastation; the colonization, also in villages, of various parts of North German territory, by means of grants of manors or otherwise, on condition of colonizing; and, lastly, the colonization, in more or less widely distributed farms, of the North-West districts of North Germany. Colonization.

Thus, at the end of last century the agricultural economy of the territories, now composing Prussia, is the net result of an intermingling of Teutonic customs, feudal law, and a peculiar colonization, and also of a not unimportant element of intervention by the Sovereign. This intervention of the Sovereign is on grounds of political, military, and commercial need favourable to the peasant in respect of certainty of tenure and of preservation of peasant land. Whereas in England the peasant (customary tenant or copyholder) could only rely upon absence of precedent to preserve certainty of tenure; in Brandenburg, and subsequently in Prussia, he could rely on the enactments of positive law. But the English Law Courts under Edward IV had already secured for the copyholder the certainty of tenure which the Royal Decrees of Brandenburg and Prussia subsequently secured for the Prussian peasant. The most important object of the intervention of the Sovereign in Prussia was the preservation of the peasant lands from the rapacity of manorial or quasi-manorial lords. It was in this direction that the wisdom of the Hohenzollerns secured for the future Prussia a most fruitful advantage. Their intervention caused, in fact, the preservation of a landowing peasantry, which united by a most important link the ancient Teutonic peasant proprietors with the modern Prussian peasant proprietors.

At the beginning of this century, Prussia is, without regarding territorial changes, very different from the Prussia of present time. Then the Monarchy is absolute; now the Monarchy is constitutional. Then the laws are certainly not enacted "consensu populi, constitutione regis" according to ancient Teutonic, or at any rate Frank, custom. Now the people are represented, and the Sovereign is theoretically a moderating power. Now legislating chambers exist, discussion is free, voting occurs, and political power is increasing. Then, the laws of the land, although for their age they contained such patterns of legislation as the Body of Law and the Law of Mortgage, are certainly defective in a statesmanlike application of known principles, and are defective in spite of the wisdom and intelligence of many a Sovereign in gleaning knowledge from the thinkers of the nation, in spite of the lessons of statecraft learnt chiefly from French examples; but also from many an English example; and in spite of the terrible instruction offered by the recent French Revolution. Political life is the life of a watch without a main-spring and balance-wheel. The peasant, burgher, and lord are the wheels in their respective places, each fixed and unmoving except by impulse from without, and each the reverse of automatic. It is true that they all revolve together with a certain precision, each in its unchangeable place, but the movement is irregular and the precision is accompanied by no regular progress. Each subject of the State is naught but such a wheel in the machinery, and is deprived of all freedom of self-willed action. Is it therefore wonderful that the mechanical thrall is not yet always the automatic citizen, especially if it be recalled that the constitutional organization of Prussia is of comparatively very recent date? Prussia in 1800 and 1870.

The industrial occupations, mainly that in linen manufactures, of the Prussian people are, at the beginning of this century, of comparatively small value. Their external commerce is of still smaller value in spite of the foundation of the "See-handlung" and the "Preussische Compagnie" by Frederic the Great, and the maintenance of the former by subsequent Sovereigns. The chief trade by sea seems to be with Holland and Spain in linen goods for exportation, and salt for importation. The mercantile system of economy had hitherto flourished, and even Krug, who writes about this time, belongs less to the school of Adam Smith than to a transitional school from which the errors of the mercantilists are not yet eliminated. Hence it is not astonishing that Frederic the Great had tried to secure his object of developing a sea commerce by means of monopolies. But it is a striking commentary on such attempts, that the "See-handlung" did not flourish as Industry.

* This is the usual view of copyhold in England, but some hold with seeming reason that the copyholders or customary tenants were merely regaining former rights.

a self-supporting institution, until it had lost its valuable monopolies. The development of the nation is every where hindered by monopolies, restrictions of classes, prejudicial taxes, and other economical falsities which weigh heavily upon industry. The long strides in industrial legislation and development which Prussia has made, have conspicuously changed the aspect of her industry.

rban population. The people of the towns, where alone industry and commerce reside, have, however, a greater freedom of action than the people of the country. The urban life is better fitted to produce individual liberty. The quicker course of trade of a town impels more quickly the current of its social life. The shrewder questionings of the burgher, who associates more closely with members of the learned professions, causes an earlier development of social and political knowledge. The busy lawyers have no mean share in this result, and in Prussia it is evident that the studies of the civil jurists caused the towns sooner than the country to obtain the benefit of arrangements, better suited than the traditional arrangements, to meet the exigencies of a developing intercourse and traffic. But, although urban development so far surpasses rural development, the town population suffers like the rest of the population from the disadvantages of the restrictions of classes, for the burgher must ever remain a burgher, and, as long as the guilds remain in full power, a

ural population. man can seldom quit the occupation into which he may enter or be born. The rural population suffers also from the disadvantages of the restrictions of classes, and the cultivating portion suffers in addition from the unfavourable state of things delineated in the following paragraph. Neither is the noble free from the universal hindrances; he and his too are for ever noble, and can in no wise intermingle with other classes.* The occupations of each class are also distinctly marked out, and the noble for instance cannot occupy himself in the special occupations of townsmen. This fencing off of each class, and of each class within a class, is on the face of it an unconscious acknowledgment of the doctrine of a selection of species, but in the soul of it an utter negation of the doctrine.†

gricultural popu- The agricultural population groan under still more unfavourable conditions of life.
tion. A large number of the peasants are serfs, and few of the rest are free from oppressive burdens under the feudal system. The lords, too, are usually hemmed in on every side by obstacles of various magnitudes. The position of the lords is scarcely less intolerable than the position of the peasants. The opposing interests of peasant and lord engender animosity and multiply disputes. Agricultural development is a painful and slow process.

ommons. The numerous and extensive rights of common oppress every homestead, obstruct all

tyle of farming. progress, and destroy all energy. The three-field system of cultivation is universal or nearly universal, and is either compulsory or imposed by circumstances. The resulting agricultural waste in time, labour, and produce is enormous. Moreover, the minute subdivision of the properties in land into many parcels is exceedingly prejudicial in many parts of the territory. The circumstances of all classes are straitened, and the poverty of the peasants is great, for even the better situated peasants (such as the "Colons") cannot prosper. The national wealth is dissipated by an antiquated system of land

easants. economy and by an unpractical system of cultivation. The peasants, as men, lead a hopeless life, and, finding it impossible to surmount all the obstacles outside themselves, to progress, sink for the most part into a stupor of content or discontent, as the case may be. If it be true that the character of the peasant, shaded in grey as it may yet be, is then shaded in darker lines, is the fact surprising? If it be feared that the character of the peasant is too deteriorated to justify his investiture with absolute property and his emergence from the paternal protection of the lord, is not the fear natural? If, too, the deterioration be asserted to be an inborn defect of race or of long-inherited imperfections, and, obviously, a thing apart from the long subsisting system, is the assertion unrepeated in the world's history of previous or subsequent date? But whatever that deterioration of character is at the beginning of this century, a few more years of the old social and political system pass, and then the peasant is entrusted with the exercise of the rights of absolute property, even if those rights do not represent ancient Teutonic rights. The grievous defects of the Prussian agricultural economy are then on all sides recognized, and, whereas in France a terrible revolution had removed similar defects, in Prussia an admirable legislation, evoked suddenly by a national disaster, begins, without a revolution, to produce a most wonderful transformation of the former agricultural economy into the existing fruitful and beneficial organization of her agricultural forces.

revious prepara- At the beginning of this century the examples of England and other States had been
on.

* Possibly the former curious position of so-called morganatic marriages in Prussian law may be owing to this careful and precise separation of classes.

† So also are the phenomena of peasant marriages for land. If the marriages were arranged to secure farming intellect, then a nearer approach to Darwinian doctrine would occur, and a Galton might discover hereditary farming genius *à posteriori* as well as *à priori*.

marked by intelligent observers from the Sovereign downwards; the tentative laws of Silesia had already shadowed out the possibility of a radical alteration; the University of Königsberg had already begun to disseminate the principles of a better political and social life; and a general quickening of ideas on all questions of State organization had followed the news of the French revolution. Thus the crop has been grown, and the measures of a few years later, for which public opinion was not in the reign of Frederic the Great ripe, find a ripened and fruitful public opinion to nourish them. For whatever weight be laid upon the powerful lever which the urgent necessity to reorganize a shattered State placed in the hands of statesmen, great stress must be laid on the fact that the materials were already at hand wherewith to accomplish that reorganization. The opinions were matured and the men were prepared. The nation in fact was ready to undergo the necessary metamorphosis. It is wisely said that—

"In the reproof of chance,
Lies the true proof of men."

But what is true of man is true likewise of a nation. It is assuredly true of Prussia, for she has shown by her felicitous reorganization and quick development since the disastrous day at Jena, that in the reproof of chance lay the true proof of her people.

Stein and Hardenberg.

This reorganization takes place under the auspices of Stein and Hardenberg and of their coadjutors and successors. It is impossible to enumerate each helper or, within the compass of this report, to give to each his due share in a legislation extending over half a century. But of the coadjutors, Thaer and Schoen at the commencement, and the late Dr. Lette at the end, of that half-century, have been already mentioned. The reorganization was effected by certain military measures, by the National Agriculture Legislation, and by an important legislation on other subjects. There is no need to mention further the military reorganization, by the aid of which the Prussian army in a few years occupied so different a position amongst the armies of Europe. Neither is there any need to enter into the details of the prolific legislation, which advanced side by side with the National Agriculture Legislation. But it is desirable in this summary to epitomize the legislation initiated by Stein and Hardenberg for the abolition of the feudal system and all the evils connected or associated with it. This legislation, broadly considered, had for its object to develop the national wealth and strength by completely severing the relations of lord and peasant and rendering each independent of the other, and each as independent as the other. The attainment of this object involved, the investiture of the peasant farmer with absolute property; the abolition of all charges and services from trifling dues to forced labour and serfdom; the removal of all hindrances to individual action such as rights of common; and the adoption of every facility for the promotion of agricultural progress. The famous Decrees of 1807 and 1811 lay down the principles and initiate the methods by which this four-fold attainment of that object is to be sought. The Decree of 1807 throws down the fences between class and class, concedes alienability and divisibility of land, uses for some purposes the temporary expedient of hereditary leases, and abolishes serfdom and servitude for the land. One Decree of 1811 removes all hindrances of the public law and many hindrances of the private law to the freest exchange of land, and deals tentatively with rights of common. The other Decree in 1811, invests all peasant farmers and peasant landowners with absolute property, and commutes all mutual rights and obligations of lord and peasant. For the standard of payment the Decree selects a transfer to the lord of one-third of the peasant's land, if he have hereditary rights, and one-half if he have no hereditary rights; but payment in capital or in rent-charges of money or kind is allowed, and the standard can, as to its proportion of the peasant's property, be deviated from, on sufficient cause being shown. Although therefore the State strikes the balance of commutation and selects the standard of payment, it does not insist imperatively and without appeal upon its rough and ready standard.*

National Agriculture Legislation.

In 1807.

In 1811.

The absence of foreign danger seems, after the Peace of Vienna, to have caused the not unnatural opposition to the Stein-Hardenberg Legislation to acquire such strength that in 1816 the sphere of its operation was much restricted. Henceforth, till 1848, all peasant holders of land,—who were not assessed to the land tax, and did not possess team-requiring farms, and had not been settled on the land since the middle of the previous century, and whose land was not subject to the obligation of being occupied by peasants—were excluded from the benefits of the Legislation. This exclusion acted most prejudicially upon the position of the peasantry, especially of the smaller holders of land in Silesia, and

In 1816.

* There is a curious confirmation of the prevalence of the three-field cultivation, in the fact that the Decree mentions two methods of paying the rent charge, either by giving up to the lord the produce of one of the three fields, or by giving up to him one-third of the aggregate produce.

even of large holders of team-requiring farms in East and West Prussia. There was, however, a gradual but slight relaxation of these excluding conditions, until the events of 1848 caused not only many provisions of the previous lagislation and all traces of this exclusion to be effaced, but also a more thorough and almost revolutionary legislation to be inscribed.

1850. The legislation of 1850 abolishes, without compensation, unless they be attached to the grant of land, certain obligations and rights, of which the chief arose out of the feudal dominion and jurisdiction. It abolishes, with compensation based upon normal prices, all other obligations and rights, and regulates similarly the property relations of lord and peasant. There is now no standard of payment, but the balance of commutation is found in the presence of the interested parties, and is paid by the peasant in money or money's value. But no such a balance can exceed two-thirds of the value of the peasant's land. There are various reasons of equity for this limitation, as well as the paramount reason of State policy, that the peasant should be able to discharge his pecuniary obligation without being forced to dispose of his land. The Special Procedure* is improved, and rent-charge banks for facilitating the payments of commutation by the peasantry are established.

It is worthy of note that, throughout the period of this legislation, peasants, whose settlement on the land could only be traced back to the middle of last century, had always a claim to the benefit of absolute ownership, and that in its earliest period, and in the period since 1850, peasants, whose length of settlement may have been much shorter, could also claim that benefit.

tinction of mmons. As regards extinction of commons, the tentative provisions of the Decree of 1811 are expanded in 1821 and 1845, but the legislation is scarcely effectual until the law of 1850 gives to it its present form. All rights of common are to be commuted on an equitable basis. A compulsory consolidation of intersected land is combined with this extinction of rights of common.

nd and agricul- al improvements. The National Agriculture Legislation does not omit references to the development of agriculture by various facilities, and the State, both directly and indirectly, promotes land and agricultural improvements of all kinds, from the reclaiming of bogs and works of irrigation to the establishment of agricultural associations and the employment of meadow and fruit masters. As to land improvements the application of the principle of association, combined with a certain amount of compulsion, is deserving of attention, for the interests of the community or State are thereby rendered paramount to the obstruction of the individual.

e work accom- hed. The fourfold attainment of the object of the National Agriculture Legislation was thus sought, and has been now accomplished or remarkably promoted. The peasant farmers have been invested with absolute property in their lands. All peasants, holders or not of land, have, sixty years ago, ceased to be serfs, and have for the most part long ago profited by a commutation of the obligations and rights involved in their relations with the lords. The hindrances to individual activity, and mainly the hindrances from rights of common, have been removed, and facilities of various kinds have promoted agricultural progress. The former relations of lord and peasant are completely severed, and each is independent of the other, and each is as independent as the other. Hence not only the peasant but the lord, and indeed all classes, have gained by this legislation. The national strength has been enormously fortified, and the national wealth has been immensely increased in consequence of the freedom of individual activity procured thereby for the economic labourer. There can be no doubt that the rapid development and great prosperity of Prussia would not have been without such a legislation; nevertheless they are not to be attributed to that legislation alone.

ect results. It is not, however, sufficient to merely state in general terms that a given legislation, which has successfully accomplished by its provisions the objects of statesmen, has conferred on the nation incalculable benefits. It is necessary to look at the direct and indirect results of that legislation in order to comprehend more clearly what such benefits really are. The regulation of the property relations of lord and peasant affected on behalf of the latter a sixteenth of the area of the five eastern provinces in which it was needed. But this official sixteenth does not represent the whole benefit, for the area of peasant property regulated under the permissive clauses of the law is not included. The abolition of services of forced labour released the peasants from $5\frac{1}{3}$ millions of days of hand-labour and $21\frac{1}{3}$ millions of days of team-labour. Dr. Meitzen estimates that the waste of labour under the former system was equal to a fourth of the day, and consequently to $1\frac{1}{3}$ millions of days of hand-labour and $5\frac{1}{3}$ millions of days of team-labour, which he calculates at a

* A full examination of the Special Procedure has been omitted in Part II, because it had been intended to supplement the sketch therein by such an examination in connection with the different Special Procedure instituted for the new Provinces.

present national gain of a minimum sum of 750,000*l.* a year. The commutation of real charges and services has caused a sum of 28,500,000*l.* sterling to pass from the peasant to the lord. If these calculations be true, then the value of the commuted labour to the lord was 2,250,000*l.* a year, whereas the capital they received only yields, at 4 per cent., one half of that sum annually. If, therefore, there had been nothing more in the operation than the exchange of one commodity against another commodity,—of land against labour,—the peasant must be held to have gained and the lord to have lost pecuniarily by the bargain. But this conclusion is reversed, or at any rate equalized, by the consideration that there existed various other rights on the part of the peasant and various other obligations on the part of the lord which entered into the account for commutation. For if the value of them could be deducted from the value to the lords of the labour days, then probably the remainder would correspond very nearly with the interest on the capital sum. But however this may be, the fact remains that that enormous sum was due, and has been paid to the lords by the peasants. The extinction of rights of common affected a half of the area of the kingdom, chiefly by the removal of the almost universal commons of fallow and stubble grazing. The consolidation of intersected lands has already displaced the evils of subdivision in most districts of the eastern provinces. The two processes of commutation of commons and of consolidation of intersected lands have together cleared away the many hindrances to agricultural progress which previously existed by reason of prejudicial commons and of wasteful subdivisions. If to these be added the direct result of great freedom of exchange in land, which the concessions of unrestricted alienability and unlimited divisibility produced, the sum of advantages which have arisen from its direct operation is certainly of sufficient magnitude to warrant the assertion that the national strength has been enormously fortified and the national wealth immensely increased by the National Agriculture Legislation.

Indirect results.

Moreover, there are many indirect results, which accumulate to warrant still more clearly that assertion. As to the national military strength,* one might mention the value to the army of the proprietary peasantry. But there are other indirect results of even more importance. The land improvements of the previous era were certainly on a grand scale, but they were necessarily works undertaken by the State. The land improvements of the present era have gradually grown independent of the leading strings of the State. The undertakings of the last twenty years, which embraced an area of 2,000,000 acres, or 2·7 per cent. of the Kingdom, have been accomplished at an average expense of 1*l.* 4*s.* 6*d.* per acre. of which the State found only 2*s.* 6*d.* In the previous era no such a signal proof of individual activity would have been possible. The more equitable assessment of the land tax, the rise of agricultural academies, the beneficial distribution of agricultural associations, and many other indirect results might be cited. But the most important is the progress which agriculture has made since her forces were unfettered. This is manifest from many special instances, and is evidently true of the Kingdom as a whole. It requires little imagination after reading the account of the present agricultural conditions of Wetzlar, and after remembering that the three-field cultivation then existed under still more unfavourable conditions, to picture the deplorable state of agriculture at the beginning of this century. It is of course assumed that the physicial conditions of agriculture were the same formerly as now, and correspond to the description of them in this Report. From the sketch of the present picture of agriculture it will have been seen that the contrast is now most striking, however backward agriculture may still be in many parts. It is not intended to ascribe even to the indirect action of the national agriculture legislation the whole progress of agriculture, but it is intended to affirm that all the other influences would not have sufficed to produce this advancement, unless that legislation had unbound the fettered forces of agriculture.

Justification of its principles.

But it is not enough to cite the direct and indirect results of the Stein-Hardenberg legislation in order to justify its existence and prove its necessity. It is also requisite to take the leading principles of that law and to inquire whether experience has shown their wisdom and demonstrated their policy. Its chief principle was undoubtedly the investiture of the peasant landholder with absolute property subject to all the influences of the freest exchange in land. Now, according to Roscher, it is important that the middle proprietary cultivators should predominate, and that they should maintain their position. The land, exclusive of the Rhine Province and the provincial district of Stralsund, in the hands of team-requiring and small peasant proprietors is 40 per cent., and of other private individual

* The object of the feudal system was to secure military strength by surrounding the Sovereign with vassals, and the vassals with soldiers interested in defending the Kingdom. The system of proprietary cultivators in Prussia secures this object far better, for the large landowner is surrounded by a multitude of independent small landowners, equally interested in defending the Kingdom, him and themselves. The similar interest of the tenant would depend upon the value of his interest in his farm.

proprietors is 45 per cent. Of the 40 per cent. about 5 per cent is held by small peasants, the remaining 35 per cent. being held by team-requiring peasant proprietors. The distinction between team-requiring farms and large proprietors is not clear, and it is not easy to estimate how much of the 45 per cent. held by large proprietors is held by middle proprietors, meaning proprietors of farms from 20 to 400 acres. But after a consideration of the numbers of large peasant proprietors, and of large non-peasant proprietors, it will be approximately accurate to take the per-centage of land in middle proprietors at 15 per cent., for the non-peasant class, and 45 for the peasant class; and thus to consider 60 per cent. out of 85 per cent. as representing the entire importance in the State of middle landed property in the hands of private individuals. 'Moreover, the number of middle proprietors, including the Rhine Province and the provincial district of Stralsund, exceeds 400,000, as compared, on the one hand, with the 18,197 large proprietors, and, on the other hand, with the 200,000 small independent farmers and 1,200,000 smaller proprietors, making in all 1,400,000 owners of the 5 per cent. of area above-mentioned, and of whatever the per-centage may be in the Rhine Province. As to whether middle proprietors maintain ther position it can only be affirmed in general terms that the middle non-peasant proprietors have not on the whole lost ground. But as regards the middle peasant proprietor, the information is more precise. The team-requiring farmers decreased in forty years by 5·11 per cent. in area, whilst the population of the Kingdom doubled; but they actually increased both in number and area in numerous districts. If, therefore, Roscher's definition of a sound agricultural organization be admitted, it must also be admitted that the existence of a predominant middle proprietary class, and the self-maintenance of that class against the adverse influences of doubled population and of free exchange of land, and in some districts of equal division, are an ample justification of the wisdom and policy of the principal of absolute property adopted by the Stein-Hardenberg legislation. But the legislation is also justified by the moral and material prosperity, which the peasantry enjoy wherever its leading principles of absolute property, of free exchange, and of individual activity have had time to produce their usual fruits. After making every allowance for every other influence promoting that prosperity, it must be conceded that a large share is owing to the influence of those principles. No legislation is of course effectual to transform unfavourable conditions of climate, soil, and position into favourable conditions, but this legislation certainly enables the peasant to battle more successfully with the unalterable conditions of his life.

Public opinion.

If a further vindication of the National Agriculture Legislation is needed, it is to be found in the fact that, whatever hardships it may here or there have inflicted, there is scarcely a voice raised in dissent from the praise universally bestowed in Prussia upon its wisdom and policy. "The opinion of good men is knowledge in the making;" but the opinion of good men respecting the phenomena of a daily experience is knowledge made and a law in the making. Such an opinion is to be gathered in Prussia respecting her present agricultural economy.

Corresponding legislation of England.

In regard to the National Agriculture Legislation of Prussia it will be interesting to the English reader to notice that it covers in fifty years an area occupied by a legislation of six centuries in England. Our corresponding legislation extends through a long series of statutes, cases, and Acts of Parliament. It begins with the Magna Charta; it contains the famous statutes De Donis Conditionabilis, and Quia Emptores and the important case of Taltarum, marking the struggle for alienability, and also the statute of Charles II, abolishing feudal tenures; and it ends with with the Copyhold Enfranchisement Acts.

In England the feudal system fell asunder sooner. The freeholders, being useful to the barons, obtained at an early date a better position, but the customary tenants had to struggle during scores and even centuries of years to get their rights acknowledged, and in the struggle too many disappeared. Both freeholders and customary tenants have now practically ceased to form part of the agricultural economy. Whereas in England the State left the ill-protected customary tenant to his fate, in Prussia the State took charge of the destiny of the corresponding class of customary tenants. Prussia has evidently these advantages over England; first, that she has accomplished in fifty years a task which occupied us, with our non-interference of Government, for six centuries without our accomplishing it so thoroughly, and secondly that, on the assumption that the existence of numerous landowners is beneficial in a State, she can, in the present day, better preserve her yeomanry and peasantry than England did in past days.

Other Prussian legislation.

Entails.

The legislation, other than the National Agriculture Legislation, affecting land can only be referred to and not epitomized from the already brief statement of it. On the whole, the Prussian system of settled estates is about as advantageous and disadvantageous as the English system. But its adoption is so limited that it restricts in a far less

degree the free exchange in land. That free exchange is, on the other hand, promoted by cheap facilities of transfer. The new mortgage law will also promote the free exchange and give freer space to real credit.* The equal division of intestate property, whether it be personal or real, and the recognized claim in law of children to certain fixed portions, constitute two important differences from English law. The law of landlord and tenant is more favourable to the latter, but as it is private and not public law, contracts displace many of its provisions. But eviction remains a more difficult process than in England and Ireland.

Transfer of land. Mortgage. Intestacy. Indefeasible inheritances. Landlord and tenant.

The position of Prussia is not only favourable in respect of the National Agriculture Legislation. It is also favourable in respect of the small proportions of land in the dead hand of the State, of the Church, of charitable institutions, and of settlement trustees. Her industrial development and the enlightenment of her legislation in all its branches, forming so great a contrast to the præ-Stein-Hardenburg era, have acquired for her enormous advantages. It is therefore imperative, whilst reserving a due share of the praise for the National Agriculture Legislation, to bear in mind that Prussia owes her present prosperity to many other causes operating together with that legislation.

Prussia has indisputably the foundations of a sound State. The imperfections of the structure will no doubt be quickly removed as time advances. She may learn some things of warning and instruction from the example of England, and England may learn many things of warning and instruction from the example of Prussia. England can assuredly mark with instruction the course of Prussian Agrarian Legislation, even if she do not learn from it a possible and practical method of dealing with the land question in Ireland. If other methods fail, she may eventually adopt the method employed so successfully by Stein and Hardenberg to settle the land question in Ireland. If then, after failure shall have attended other methods, success shall attend such a method, the confirmation of the wisdom and policy of a system of proprietary cultivators would be so notable that the law, which is now in process of making in Prussia, would become a law unto all nations in altering their agrarian legislation. But whether or not this may occur, Prussia can with pride point to all the numerous branches of her legislation during this century, and can justly declare, in virtue of their fruitfulness, that Goethe would not certainly address to Her the reproach—

The Prussian State.

"Vom Rechte das mit uns geboren,
Von dem ist leider NIE die Frage."
